On the 7th of December 1593, the Lord Maxwell, warden of the western marches of England and Scotland, having, in conjunction with the then lairds of Drumlanrig and Closeburn, collected two thousand men in arms, marched into Annandale, to besiege the laird of Johnston's house of Lochwood, a place of great strength, and through deadly spite to extirpate *him* and all of his name. Accordingly, early on the morning, the laird Maxwell came to Lockerbie, expecting to find the Johnstons, vassals of the Lochwood family, at home; but being disappointed, burnt the house of Nether Place, the residence of the laird of Lockerbie's brother, and afterwards returned to his party at Dryfesands. It so happened that Annandale Johnston soon appeared with only forty horses, with which he engaged eighty of the enemy; put them to flight, pursuing a certain length, and then, through design, suddenly retreating, were followed by the whole body of the enemy, with Lord Maxwell at their head, till they came to the Torwood, on the south-east side of the Dryfe. Here they were suddenly joined by four hundred Annandalians, who sprung out and surprised the enemy. After a short but bloody struggle, in which they were joined by a few Scots from Eskdale, under the laird of Buccleugh, they put the forces of Lord Maxwell into complete confusion, and completed their victory by putting upwards of seven hundred of them to the sword. Among those whom they put to death was Lord Maxwell himself, whom they killed under very cruel circumstances. He was struck from his horse in the flight, and inhumanly slain, after the hand which he stretched out for quarter had been severed from his body. His routed troops fled to the Gotterbie Ford of the Annan, where many were drowned in their attempts to cross the river. A great number that escaped were dreadfully slashed in the face, by the sharp weapons of the Annandalians, in the heat of the conflict; and hence a stroke in the face, in this part of the country, till the present day, obtains the name of "*a Lockerbie Lick.*"

DAY AND NIGHT.

Besides the yearly circuit which the earth makes around the sun, there is also a daily one, in which it revolves round its axis in the space of twenty-four hours; thus causing the regular vicissitude of day and night. The earth's motion is from west to east; and hence the sun, which is a fixed object, appears to move from east to west. If a line were carried round and round the globe, it would require to be the length of 24,855 miles; hence this is the actual space which any given point on the earth's surface travels over in the course of twenty-four hours, a rate exceeding somewhat 1000 miles in the hour. This velocity, with which every person moves continually, is greater, by 140 times, than that with which a cannon-ball issues from the mouth of a cannon; and yet we do not perceive it, because the earth, the air, and every thing around, is carried with us: whereas, if we passed with a thousandth part of this velocity through air standing still, the concussion and current caused in this fluid would be tremendous. It is probable, too, that the earth with its surrounding atmosphere passes through empty and impalpable space, otherwise the prevailing laws of friction and resistance would impede its course, and produce a sound which would be intolerable to human ears. It is somewhat singular, that all the planetary bodies observe the same direction in their motions around their axis, from west to east; thus indicating, even in the remotest parts of creation, a unity of design and purpose, that, in the eye of their Divine Creator, must serve some important end. Although the motion of the earth is of that easy and gliding nature as to be imperceptible under ordinary circumstances, it yet may be very easily made apparent to our vision. If we fix our eye on the sun or moon as they are just peeping up from the edge of the horizon, we find that in a very few minutes they move over a considerable space; and if we are set in a particular position at a window watching the moon, we shall find, that in no long period this luminary will disappear, and become concealed beyond the window-frame: in other words, the earth on which we are seated will have moved so far to the eastward. It may occur to one fond of inquiring into final causes, what is the use of this rotatory motion? Would it not have been as well if the earth had stood still? Perhaps the earth could not stand still, consistent with the prevailing laws of gravity; for we find motion, in some shape or other, is an invariable law of matter. At all events, a revolving motion on its axis is necessary to keep our globe within due limits of the sun; for did it cease to turn round in its daily motion, the sun's central attraction would prove so great as to draw the earth into contact with that luminary. But nature serves many ends with one design, and the alternate recurrence of day and night is no less beneficial to man and his dependencies, than to the upholding of the planetary sphere. Day and night are subordinate changes to summer and winter, but no less useful and conducive to the pleasure of man. Day is the season of light, and beauty, and active exertion, and enjoyment; night is the period of darkness, of repose, and of refreshing slumber. Sleep is essential for repairing the wasted nervous energy of animated beings; and night, with all its accompaniments, seems no less adapted for the enjoyment of refreshing sleep. Even the vegetable kingdom partakes of the repose of night; and it is highly probable that several important processes are carried on in plants during the absence of light, that differ entirely from those performed in sunshine.

In those countries near the equator, or midway between the north and south poles of the earth, day and night are of nearly equal duration throughout all seasons of the year. As we proceed from the equator to the poles, however, the length of the day varies with every varying period of the seasons. In the latitude of Britain, our longest summer day is about seventeen hours, while the night is only seven. Our shortest winter day, again, is just the reverse of this, extending to little more than seven hours. Twice a-year, at the period of our spring and autumn equinox, day and night are of the equal length of twelve hours each. About an hour before sunrise is reckoned the coldest period of the twenty-four, for by this time the heat diffused on the earth's surface in the previous day, has in a great measure been dissipated, and it requires the presence of the great luminary again to impart heat and light to nature. The beautiful and gorgeous tints of the rising and setting sun have been the theme of all admirers of nature. In all that regards the actual circumstances, sunrise and sunset is one and the same thing; yet the accompanying appearances are generally very different—so much so, as to impart a peculiar aspect to the morning and evening sky. The cause of colour in both is the slanting rays of light falling on masses of vapour hovering near the edge of the horizon; and being thus refracted or broken into the various simple rays of colour, impart a red, or yellow, or purple hue, or all these alternating and combining in splendid variety.

In the early dawn, the vapours are generally thin,

diffused, and less abundant; hence the milder, softer rosy hue of the sky. In the evening, again, especially after a hot and sultry day, and in an autumn evening, when the season begins to feel chill, the clouds are condensed in thick and numerous layers or strata, the falling rays are more powerfully refracted, and thus the brilliant display of varied tints is produced. In tropical climates, the evenings are short, and unattended by any beautiful displays; the perpendicular sun darts down suddenly below the horizon, and leaves every object in the obscurity of shade; nor there has the exhaled vapour an opportunity of condensing in the hot and sultry air: it is only in temperate regions that the beauty of the morning and evening sky can be contemplated with pleasure.

LITERARY HISTORY OF THE BIBLE.

THE HEBREW LANGUAGE.

After having spoken of the books contained in the Bible, and of the divisions of those books which have been used by the Jews and the Christians, both in ancient and modern times, it may now be necessary to examine a little into the language in which they were written. The Old Testament was originally written in the Hebrew tongue; and this language is generally considered as having the best claims to be considered the most ancient at present existing in the world, and, perhaps, as the primeval tongue of the human race. By the Hebrew language, therefore, is meant that which was spoken by Abraham, Isaac, Jacob, and the Twelve Patriarchs, which was afterwards preserved among their posterity, and in which Moses wrote, it being improbable that he would employ any other language than that which was in use among the Jews.

This language is supposed by some to derive its name from *Heber*, great-grandson to Shem, whose posterity were denominated *Hebrews;* but it is much more likely that it received its name from its being the mother-tongue of the descendants of Abraham, who were called *Hebrews*, not because they were descended from *Heber*, but because Abraham, having received a command from God to leave the country where he lived, which was beyond the Euphrates, passed that river, and came into the land of Canaan, where the inhabitants of the country gave him the name of *the Hebrew*, that is, *one that has passed over;* in the same manner as the French call all those that live beyond the mountains, *Ultramontanes*.

The reasons that demonstrate the antiquity of the Hebrew tongue are many. In the first place, the names which the Scripture explains are therein drawn from Hebrew roots. It was thus that the first man was called *Adam*, because he had been formed out of *the ground*, which in Hebrew is called *Adamah*. The first woman was called *Eve, because she was the origin of life to all*, *Evach* in Hebrew signifying *to live*. The name of *Cain*, which comes from *Canah*, signifying *to acquire*, or *get*, alludes to what Eve said when he was born—*I have got a man from the Lord*. The explanation of these names is not to be found in any language but the Hebrew; and as this relation between names and things does not occur in any other language, it is in it alone that we can see the reasons why the first human beings were so called.

The names of an immense number of people, also, who are descended from the Hebrews, show the antiquity both of the nation and the language. The *Assyrians*, for instance, derive their name from *Ashur*, the *Elamites* from *Elam*, the *Arameans* from *Aram*, the *Lydians* from *Lud*, the *Medes* from *Madai*, and the *Ionians* from *Javan*, who are all traced in the Hebrew bible to Shem, Ham, and Japhet. These names have no signification in any language but the *Hebrew*, which shows that they are derived from thence, as are also the ancient names of the Pagan deities; to which we must add the remark, which several learned men have made, namely, that there is no language in which some remains of the *Hebrew* are not to be found.

A very apposite example, in allusion to the meaning of proper names in Hebrew, is to be found in the Book of Ruth, towards the end of the first chapter, where it is said, "And the whole town was in commotion about them; and the women said, Is this Naomi? And she said to them, Call me not Naomi (which means *Delightful*); call me *Marah* (which means *Bitter*); for the Almighty (*Emer*) hath caused *bitterness* exceedingly to me. I went away full, and Jehovah hath caused me to return empty; wherefore, then, do ye call me *Naomi*, since Jehovah hath brought affliction on me, and the Almighty hath caused evil to befall me?"

Thus we see that in Hebrew, as well as in most of the Oriental languages, all proper names are significant words; and this is found to be the case also amongst many of the nations of Africa. This circumstance has a great effect in increasing the energy of the diction in these tongues; for it not unfrequently happens, as in the case of Naomi, that the speaker or writer, in addressing a person by his name, makes use of it at the same time as a word of ordinary signification, to express something in the inward disposition or the outward circumstances of the possessor. Instances of this occur in almost every page of the Hebrew Scriptures; and, as may readily be supposed, it is impossible, in such cases, for any common translation to do justice to the energy of the original. We have a very remarkable example of this in the twenty-fifth chapter of 1st Samuel, at the 25th verse; in which Abigail, speaking of her husband Nabal, says to David, "Let not my lord set his mind at all now towards the man of *Belial* (*i. e.* worthless), this same person, towards *Nabal* (which means a scoundrel); for like his name so is he; *Nabal* is his name, and *Nebĕlah* (*i. e.* vileness) is with him."

In speaking of the meaning of proper names, however, the most extraordinary example, perhaps, that can be produced from any book, either ancient or modern, is the following, which is to be found in the fifth chapter of Genesis:—The names of the *ten* antediluvian patriarchs, from Adam to Noah inclusive, are there given; and when these ten names are literally translated, and placed in the order in which they occur, they form altogether the following very remarkable sentence in English:—Man, appointed, miserable, lamenting, the God of glory, shall descend, to instruct, his death sends, to the afflicted, consolation!

We need not be surprised, therefore, at what is mentioned in the *Spectator* (No. 221), of a certain Rabbinical divine having taken the three first of these names as the subject of his discourse, forming thus the text of a regular sermon. "We had a Rabbinical divine in England," says Addison, "who was chaplain to the Earl of Essex in Queen Elizabeth's time, that had an admirable head for secrets of this nature. Upon his taking the doctor of divinity's degree, he preached before the university of Cambridge upon the first verse of the first chapter of the First Book of Chronicles, 'in which,' says he, 'you have the three following words:—

'Adam, Sheth, Enosh.'

"He divided this short text into many parts, and by discovering several mysteries in each word, made a most learned and elaborate discourse. The name of this profound preacher was Dr Alabaster, of whom the reader may find a more particular account in Dr Fuller's Book of English Worthies."

It is evident, that although this matter appeared ridiculous enough in Addison's eyes, so as to furnish him with a theme for a very amusing paper, yet, on considering attentively the meaning of the original words here used as proper names, a great deal of very sound doctrine might be elicited by a subtle divine, even from such an apparently insignificant text.

In the same way, the names of animals in Hebrew are found to be words expressive of their qualities, which gives support to the idea that this was the language which Adam used when he gave them their names; as we find recorded in the second chapter of Genesis, at the 19th verse—"And Jehovah God formed out of the ground every beast of the field, and *he formed also* every fowl of the heavens; and he brought them unto Adam to see what he would call them, and whatever Adam called it—the living creature—it is its name."

Some of the names of animals in Hebrew are still found to be clearly descriptive of their qualities; and, therefore, in regard to what animal is intended, there can, in such cases, be no dispute. But with respect to some others, the matter is not so plain; as, from the root not being now found in the language, the ideal meaning of the name cannot be so readily ascertained: and hence the eleventh chapter of Leviticus, in which the names of certain clean and unclean animals are enumerated, presents difficulties to a translator of no ordinary description.

There is, perhaps, no language in the world so easily reduced to its *original elements* as the Hebrew. As Wilson has well expressed it, "We descend from Words to their Elements; and the accurate knowledge of Letters is the principal part of Hebrew grammar. Its flexion nearly approaches that of the modern languages, particularly the English. The relations and dependencies of nouns are not distinguished by terminations, or cases, but by particles or prepositions prefixed. The persons, moods, or tenses of verbs, are not marked by the changes of their last syllables, but by means of letters of a particular order, which sometimes appear in the middle, sometimes in the beginning, and sometimes in the end of the original word." In fact, the structure of the Hebrew language is peculiarly favourable for the expression of energy and sublimity. The words, as is well known, are remarkable for shortness, the greater part consisting of not more than two, three, or four letters; few words have more than ten letters, and those that consist of that number are not many. The sentences are also, for the most part, short, and are quite free from that complexity which is apt to embarrass the reader when perusing even the best authors of Greece and Rome. The idiom of any language consists in the order of the words; but it is well known that, in this respect, the Greek and Latin tongues are extremely capricious, the words being arranged in them not in the order of the *understanding*, but of the *ear*, according to the sound rather than the sense. The Greek and Roman writers place the emphatic words in whatever order the sentence can be made to run most musically, though the sense be suspended till the speaker or reader come to the end; and hence the need of so many flexions and syntax rules for a learner to arrange them to find out the meaning. Yet, even for this purpose, more declensions than one were not necessary; nor more tenses than three, a past, a present, and a future.

From this mass of perplexity, the Hebrew language is entirely free. Its original words, called roots, consist of a proper number of letters, commonly three, the fewest that make a perfect number; and they express an action finished or perfected by a single agent. It has a proper number of voices, *i. e.* active, passive, and medial—and only the tenses that are in nature. Its primitive words are more sentimental and scientific than sonorous; and they express original ideas, being definitions of things descriptive of their natures.

The Hebrew, Greek, and Latin, and such as are immediately derived from them, or constructed on their model, are the only languages that are formed on a regular artificial plan; and all other tongues of which we know anything, except, perhaps, the Persian and the Sanscrit, must be considered in comparison as mere gibberish, being quite rude in their original formation; nor is it possible to reduce them to another state, without wholly metamorphosing them. That which was never the language of a cultivated learned people, and in which there are no literary works of taste, cannot be a polished language, although it may have been the language of a civilized nation, or of a court, if they were only an illiterate people. In a word, all languages that have a *concourse of consonants*, or *silent letters*, are rude in their writing or pronunciation, whatever their structure may be. The Greek and Latin are free from the latter fault, and the Hebrew from both. "As Solomon possessed the most wisdom and knowledge," says Mr Ray, "and treated all subjects of natural philosophy, &c., and his court being the most splendid and elegant, as people came to it from all nations, and greatly admired it, the Hebrew must be a copious, elegant language; and its structure is invariable, being the same in Moses and Malachi, at a thousand years' distance."* In speaking of the *genius* of a language, indeed, which is its force, vigour, or energy, the Hebrew may without doubt be said to excel all.

It is evident, therefore, that if, as Longinus observes, "saying the greatest things in the fewest words" be essential to sublimity and energy in discourse, the Hebrew is the best language in the world for the purpose. In it we have no superfluous parts of a sentence in words, or even in *letters*. A Hebrew writer conveys his meaning without *circumlocution;* for although he were inclined, he would be unable to accomplish it, because the language is quite unsuitable in its nature for being employed in any such way; and, therefore, if an author's subject be good, even although he should possess but little genius, he will find no great difficulty to clothe his ideas in sublime and energetic language, if he write in Hebrew.

Such is the simple nature of the formation of this primitive language, and which seems, at the same time, to entitle it more to the claim of being a philosophical tongue, than, perhaps, any other in the world. It is remarkable that the structure of this very ancient language approaches closely to that of the English, and other modern tongues; as the relations and dependencies of nouns, according to what has been already remarked, are not distinguished by terminations, or cases, as in Greek and Latin, but by particles or prepositions (or little words), prefixed, and which are, at the same time, conjoined with the noun, as if they were a part of it.

The advantages which the Hebrew language possesses above all others in the simplicity of its formation—its remarkable originality, in that it borrows from no language, whilst almost all others borrow from it—as also the ideality which is found to pervade its roots or primitive words—have all been considered as entitling it to higher claims in the consideration of philosophers, than any other language in the world, either ancient or modern. These notions have been carried to such a length, indeed, by some learned men, that they gave rise to an entirely new school of philosophy, generally known by the designation of the Hutchinsonian; the disciples of which are remarkable, as being opposed in many things to the Newtonian system, and as being possessed with the belief that in the Hebrew language, and in it alone, are to be found the germs of all true philosophy. The system takes its name from John Hutchinson, an English philosopher and critical author, who died in 1737, and was remarkable as an opponent of Dr Woodward on natural history, and of Sir Isaac Newton in philosophy.

POPULAR INFORMATION ON SCIENCE.

RAIN.—SECOND ARTICLE.

The seasons of the year, while they contribute by their variety to our pleasure and happiness, are characterised by such weather as is best adapted to the necessities of the vegetable and animal creation; wherefore the proportions of rain vary in different months of the year. In summer we have not so many rainy days as in winter; but the showers are then heavier, the streams of rain closer together, and the quantity which falls is greater than during any other season. Dr Dalton, whose scientific accomplishments we have before had reason to notice, concludes that the first six months of the year may be regarded as dry, and the last six as wet months. Another ingenious author has inferred, from long observation, that in spring it rains oftener in the evening than in the morning, but that towards the end of summer, oftener in the morning than the evening, and storms at this time are apt to occur a little after sunrise. The reason that in winter less rain falls, though we have more rainy days than in summer, is, that the temperature of the air is less variable in winter, and the condensation of moisture not so forcible; therefore, the rain continues falling in small drizzling drops, which, accompanied or followed by chilly north-east winds, gives rise to colds and coughs, and many distressing maladies, which often sweep into the grave the most delicate and lovely beings, to whom our affections have been in this world most allied. Here, too, we may observe, that, while a clouded and damp atmosphere favours the increase of vegetable foliage, it is not so favourable to its fructification. In such seasons, while the blades of grass grow broader, the nutritious principle which they should contain is not well developed; so that animals feeding on this poorer grass are obliged to take a larger portion to satisfy their appetites. Cattle and sheep which feed on such pasturage may be observed to be almost continually eating; whereas, in moderately dry seasons, when the occasional rains have been heavier, every blade of grass grows more healthily, its nutritious principle is better evolved, and less sufficing. The same animals may be seen lying down and ruminating in the shade.

In the progression of the seasons, rain falls at all times during the twenty-four hours; but Luke Howard has concluded, that much less falls by day than by night. "According to my experiments (says he), the rain that falls by day makes only one-third of the quantity that falls by night."* After the fall of rain, we must all have remarked how the grass, flowers, herbs, and trees, assume a richer aspect—

> "There is life in the fountains,
> There is joy in the mountains."

All nature is gladdened and refreshed. The most inattentive person too must be sensible of the delightful fragrance which seems breathed from every leaf and every flower. This peculiar effect is, by Forster, attributed to the rain, especially of thunder showers, being highly electrified, and this, most probably, has a considerable influence; for, doubtless, the more powerful exhalation of such odours, after rain, is occasioned by the stimulus which the refreshing rain affords the vegetable creation. Such are the general phenomena attendant on the fall of regular rain, without the benign agency of which, the fields would be parched up, and every herb withered by excess of drought. In scripture phraseology, "the earth would cry for succour unto the heavens, and the heavens unto God."

IRREGULAR RAIN.

We term rain irregular when it presents us with appearances which are out of the ordinary course of nature. Thus, authentic accounts have been published of yellow rain, red rain, luminous rain, viscid rain; besides which, showers of nutritious substances, of fishes, and of reptiles, have also occurred in different parts of the world. It is easy for the ignorant, who are always ready to give rash and arrogant decisions, to deny at once the possibility of these or any other preternatural occurrences; but the well-informed mind, conscious how limited is the extent of human knowledge, will receive with no over-hasty credulity the acknowledgment of such apparently anomalous facts, and wait with becoming patience and humility until the advancement of science, by unfolding the explanation, dissipates the apparent mystery.

Yellow Rain has fallen during storms in various parts of Europe. It has occurred in Norway and in Copenhagen, and, about twenty years ago, rain of this kind fell in Germany. This appearance is thus explained: The pollen, or impregnating seed-dust of the flowers of the fir, birch, juniper, and other trees, is of a yellow colour, and this pollen, by the action of the wind, is carried to a considerable distance, and descends with falling rain. This yellow rain has also been found impregnated with sulphur. The rain of this kind alluded to, which fell in Germany, was so saturated with sulphur, that matches were made by being dipped in it.

Red Rain has also been noticed. In the year 1810, a shower of red rain fell in Hungary. It lasted a quarter of an hour, and the water was like blood. This was ascertained to be owing to the rain-water being loaded with the red pollen of pine-trees, which were the principal trees in a neighbouring forest. On the 14th of March 1813, a shower of red mineral rain fell in Upper Italy. At the time, thunder was heard, and lightning seen in every direction. This peculiar rain was carefully analyzed, and its chemical elements discovered. Here, in explanation, we may observe, that there is generally a little iron, and other adventitious substances, in the air, the aggregation of which might have occasioned this phenomenon, for thus meteoric stones are supposed to be formed; and perhaps, had the attraction been different in this instance, such might have been produced.

Viscid Rain has also fallen. In the Transactions of the Royal Society of London, an account is given of a shower of viscid rain which happened in Ireland. On examination, it was found to be owing to the presence of extraneous matter, partly vegetable and partly animal.

Showers of Nutritious Substances have been recorded on unquestionably good authority. We do not allude alone to the manna which fell in prodigious quantities round the Hebrew camp—for that may be regarded as a miracle, and is considered to admit of a typical interpretation. In Arabia, manna is found in great abundance on the leaves of many trees and herbs, and may be gathered and transplanted to a distance by the wind. Even so recently as 1824, a shower of this kind occurred. In 1828, a substance was shown to the French Academy, which fell in the plains of Persia. It was eaten, and afforded nourishment to cattle and many other animals. This nutritious matter was found to be a vegetable production—the *Lichen esculentis* of authors—which had been transported thither by the wind.

We are not, in these various instances, to forget the powerful agency of the wind, which often has been proved to carry, to a prodigious distance, sand and dust, and the ashes and scoriæ which have been thrown up during the eruption of volcanoes. Not very many years ago, during a strong gale, herrings and other fish were carried from the Frith of Forth so far as Lochleven—a fact which has been well attested. In some countries, rats migrate in vast numbers from the high to the low countries; and it is recorded in the history of Norway, that a shower of these (thus transported by the wind) fell in an adjacent valley. A shower of toads is reported to have fallen many years ago at Portobello; but we are inclined to suspect the truth of this tradition.

SIGNS OF RAIN.

We shall conclude this article by enumerating a few of those prognostications of approaching rain, which, admitting of explanation, are most interesting. When the moon is of a pure silvery colour, good weather is indicated; but when it has a brown or chestnut coloured tint, rain may be expected. This is owing to the effect of the vapour in the atmosphere in refracting the moon's light. For the same reason, when stars are surrounded by coloured haloes, the approach of rain is indicated.

When mountain ranges or distant objects appear nearer to us than usual—when sounds are heard more clearly from a distance—when the odour of plants is more than usually powerful, rain may be prognosticated. The first of these signs arises from the effect of an excess of moisture in reflecting and refracting the rays of light—the two last from sounds as well as odours being conveyed better through a damp than through a dry air. The low flight of swallows indicates approaching rain. The cause of this is, that they pursue flies, which delight in warm air; and these flies, escaping from the excess of moisture above, descend nearer to the surface of the earth, and are there pursued by these birds.

Ducks, geese, and other water-fowls, before the approach of rain, may be seen to throw water with their bills over their backs, and dive frequently; the cause of which is, that, although so much in the water, they do not like being wet to the skin; to avoid which, when warmed by the peculiar sensation preceding rain, they close their plumage together, by throwing a sudden weight of water on their bodies, in the direction of the growth of their feathers.*

Before the fall of rain, cattle may be observed stretching out their necks, and snuffing in the air with distended nostrils, which, doubtless, is occasioned by the odours of plants being more powerful than usual when the air is saturated with an excess of moisture.

It is unlucky for anglers to meet *one* magpie, but *two* is a favourable sign: for this reason, if stormy weather be likely to occur, one magpie alone leaves the nest, the other remaining to protect the eggs; but if fine weather be at hand, both leave the nest with impunity, for their eggs are then not likely to suffer injury.

Man in strong and robust health does not feel his constitution affected by that change in the state of the atmosphere which precedes rain; but persons who are in delicate health are often much affected. Pain of the head, toothache, irritability of temper, pains in old sores which have healed, the aching of corns, and excessive nervousness, are all, in certain habits of body, signs of approaching wet weather.

Dogs closely confined in a room become drowsy and stupid before rain; the same in a less degree is observed of cats; horses neigh much; cattle low; the fallow-deer becomes restless; and many other animals, from the uneasiness they feel owing to the altered condition, prognosticate the approach of rain. The hog, however, is but an indifferent guide. During the great earthquake in Calabria, all other animals were much agitated; but this animal did not seem to be at all affected. Insects being very sensible of every change in the state of the atmosphere, are good weather-guides: hence, fine weather may be predicted when many spiders' webs are seen in the open air; also when bees are found far beyond their hives. On the contrary, when spiders remain hidden, and bees do not range abroad as usual, rain may be expected. Many flowers and plants are excellent prognosticators of the weather. When the flower of the chick-weed expands freely, and remains open, no rain will fall for many hours; but when it closes, showery weather or continued rain may be expected. The trefoil, the convolvulus, and many other plants, contract their leaves before the approach of rain.

The cords of stringed instruments, such as the piano-forte, harp, guitar, violin, &c. frequently snap previous to the fall of rain, which is occasioned by their shortening, in consequence of imbibing some of the additional moisture in the air.

Many other prognostications of wet weather are recorded, but these being among the most interesting, have been selected by us for this occasion; and now, having once more terminated our agreeable task, we say, farewell, hoping our readers will not decline accompanying us on our next meteorological excursion, in which we propose alluding more particularly to the nature of hail, snow, dew, mists, fogs, and other phenomena, which, while they afford us pleasing varieties, contribute to the wants and happiness of all living beings.

PHYSIOGNOMY.

One of the faculties which children acquire earliest, is that of distinguishing character by the lineaments of the countenance. Their observations of course do not at first embrace any extended range; they cannot conclude from the particular cast of features that a person is avaricious, envious, cruel; or, on the contrary, that he is generous, benevolent, humane. Between the different modifications of the good and evil passions, they have not the capacity minutely to discern. All that they are able to determine is, whether an individual is to be dreaded or loved. On beholding one face, they turn away in a fright, and shrink for refuge into their nurse's bosom; while on another they gaze with confidence and satisfaction. It is true some children are naturally shy, and will be greatly discomposed if the eyes of a stranger, whatever be his character, rest upon them for any length of time; but it is equally true there are some countenances which they dare not contemplate even when they themselves are not observed. As they grow older, their acuteness increases; they never make a mistake in regard to those upon whose knees it is safe for them to climb, nor are they ever seen plucking the coat-tails of a fellow whose disposition is surly, or attempting in any manner to establish a familiarity with him. At a safe distance, they bend their clear round eyes full upon every visage; and if it appear promising, all at once they burst forward with a shout of glee, and commit some romp-provoking freak: on the other hand, a sinister expression abashes their little hearts, and they slink away behind backs out of the reach of its influence. Every one who has been accustomed to watch the motions of children, must have observed with what attention they regard the features of a stranger, and how speedily they make up their minds how it is proper for them to behave in his presence.

The knowledge thus early acquired is improved by uninterrupted practice with the advance of years. Full soon the schoolboys

> The day's disasters in the morning face"

of their instructor; and by the time they are grown to years of discretion, and beginning active life, they are complete adepts in the art of deciphering countenances. Hence the fatal facility with which they trust some persons, and the decided dislike they manifest at first sight to others; for they have as yet learned only to judge of what may be called the natural countenance, without reference to the artificial characters which long habits of intercourse with the world superinduce. By the mistakes committed at this period, they are not discouraged, and driven to abandon this system of reading the mind through the features; but, adjusting their knowledge according to the various new modifications of the criteria which daily present themselves, they learn to look with greater keenness of perception, as well as greater caution, through the face, as it were, into the inmost man. All who have the power of sight and the power of judging employ them in this manner. The most illiterate are no less proficients in the art of physiognomy than the wisest of men, and the result of their observations is conveyed in language considerably more forcible. "The gallows is stamped on his forehead," they say, on inspecting a visage peculiarly truculent. If a customer with a sinister look enters a shop, the merchant, after he is gone, asks his assistant, "Did you look well to the money he gave you?" The politician is perhaps too wily to give his thoughts expression in words, but he gazes not the less anxiously, endeavouring to pe-

netrate the triple brass behind which is concealed the purpose of his adversary.

The most celebrated writer who has undertaken to instruct men better in this universal art, is Lavater, a Swiss clergyman. A close observer, shrewd, enthusiastic, himself one of the mildest and most amiable of beings, he thought he discovered in it the means of ameliorating, in an incalculable degree, the condition of his fellow-creatures. By its proper cultivation, he conceived that the excellent qualities might be early perceived and fostered, while the bad might be discouraged and repressed. "The most indisputable," he says, "though the least important advantages of physiognomy, are those the painter acquires, who, if he be not a physiognomist, is nothing: the greatest is that of forming, conducting, and improving the human heart. Where the dark inattentive sight of the inexperienced perceives nothing, there the practical view of the physiognomist discovers inexhaustible fountains of delight, endearing, moral, and spiritual. It is the latter only who is acquainted with the least variable, most perspicuous, most significant, most eloquent, most beautiful of languages—the natural language of moral and intellectual genius, of wisdom and virtue. He reads it in the countenances of those who are unconscious of their own native elocution. He can discover virtue, however concealed. With secret ecstacy, the philanthrophic physiognomist discerns those internal motives which would otherwise be first revealed in the world to come. He distinguishes what is permanent in the character from what is habitual, and what is habitual from what is accidental. He, therefore, who reads man in this language, reads him most accurately." In a strain of higher eloquence, speaking of the impossibility of seizing and expressing by words or on canvass, though the physiognomist can understand them, many minute traits of character, he proceeds—"Numberless of these can neither be described nor imitated. How many even are not to be retained by the imagination! How many that are rather felt than seen! Who shall describe, who delineate the cheering, the enlightening ray—who the look of love—who the soft benignant vibration of the benevolent eye—who the twilight and the day of hope—who the internal strong efforts of a mind wrapt in gentleness and humility, to effect good, to diminish evil, and to increase present and eternal happiness—who all the secret impulses and powers collected in the aspect of the defender or enemy of truth—who 'the poet's eye in a fine frenzy rolling, glancing from heaven to earth, from earth to heaven, while imagination bodies forth the forms of things unseen'—who shall all this delineate and describe? Can charcoal paint fire, chalk light, or can colours live and breathe?"

The friend of Fuseli, Lavater possessed no inconsiderable powers as a sketcher of portraits, and he enforced his favourite doctrines at once by the eloquence of his pen, and the ingenuity of his pencil. A series of heads, some of them real, some imaginary, accompanied by appropriate commentaries, spread a mania of physiognomy throughout Europe. He was equally ridiculed and applauded. Judgments which he had never delivered on the portraits of the eminent men of his time were assigned to him, and, being adapted to the views of particular factions, contributed, perhaps, as much as his own veritable decisions, to procure for him an extensive notoriety. Many individuals, both in this country and abroad, set themselves to act according to the rules he was supposed to have laid down. Before servants were engaged, their countenances were subjected to the minutest scrutiny; parents contemplated with unusual attention the faces of their children, and resolved to educate them with a careful reference to the capacities they hoped to discern; and the ancient, but, by the prudent, little approved practice of falling in love at first sight, was exercised for a time by sanction, as was believed, of one of the "exact sciences." Yet, notwithstanding all the extravagancies attributed to Lavater, there is little in his system but what is found in the universal belief of mankind. That the action of the passions is perceptible in the motion of the muscles, in the flexible parts of the human countenance, all admit. The appearances thus caused acquire permanence and solidity by frequent recurrence. This is equally undisputed. Lavater only went a step further, and sought to determine the indications of physiognomy with greater certainty, by the form of firmer parts of the face—the outline of the forehead, nose, cheekbones, and chin. The forehead to the eyebrows he held to be the mirror or image of the moral and sensitive life; and the mouth and chin the image of the animal life; while the eye is to the whole as its summary and centre. But the peculiarities, if such they be, of his creed, will be best explained by a conversation which he had with Joseph the Second at Waldshut. In the summer of 1777, Lavater happened to pass through that town when the emperor was there, and was sent for to an interview.

"Ah, you are a dangerous man!" said Joseph; "I do not know whether any one ought to suffer himself to be seen by you; you look into the hearts of men: we ought to be very cautious when we come into your company."

"No honest and good man," answered Lavater, "need to fear me, if I could really look as deep into the heart as some men imagine I can, which I am very far from being able to do. I consider it as my duty—and it is a pleasure to me—to notice rather what is good in my fellow men than their failings. I am besides, myself a sinful man, who would not always wish that others should see into my heart, and whom it very ill becomes to be too severe."

The emperor seemed to be satisfied with this answer, and, leading Lavater towards an open window, continued—"But can you tell me how you came to conceive the idea of writing on such a subject?"

"I had occasionally drawn portraits," replied the physiognomist, "and had observed particularly striking resemblances between corresponding parts and features of the countenance of different persons; as for example, similar noses distinguished by particular acuteness. This very naturally led me to inquiries into the resemblances that might be found in their character, dispositions, and intellectual powers, how different soever they might in general be: and I found as evident resemblances in their minds as in the features of their countenances. Thus was I induced to inquire farther, till gradually I arrived at the point where now I am."

The emperor then asked concerning the ancient authors who had written on the subject, and in what respect he differed from his predecessors.

"Many of them," replied Lavater, "treated the science rather with a view to the prediction of future events than rational observation; they said and wrote more than they saw and felt: I merely observe, and assert nothing but from my own observation. The old authors say generally—high foreheads, and large foreheads, betoken a feeble and slothful man. We certainly find feeble and slothful men with large and high foreheads; but all large and high foreheads are not signs of feebleness and sloth. Let us recollect Julius Cæsar. There are such foreheads which accompany extraordinary penetration and activity. Such erroneous judgments can only be avoided by the most accurate precision. My endeavours have therefore been directed to define the peculiarities of each part of the countenance as accurately as possible, both by delineation and descriptive terms. I have likewise employed my attention more on the firm, defined, and definable parts of the human physiognomy, than on the moveable, momentary, and accidental. The greater part of physiognomists speak only of the exterior signs of the passions, and the expression of them in the muscles. But these exterior signs are only transient circumstances, which are easily discoverable. It has, therefore, always been much more my object to consider the fundamental character of the man, from which, according to exterior circumstances and relations, all his passions arise as from a root. The expression of that, I find partly in single features—in the terminations and outlines of the forehead, the nose, the skull, or the bones—and partly in the harmonious combination of these parts in one whole. Much more difficult to recognise, but, at the same time, much more certain and decisive, are the expressions of the powers of the mind which are manifested in the countenance at rest."

The emperor listened with attention, seeming to reflect on what was said with some surprise. "He for an instant turned," says Lavater, in his account of the interview, "with a gracious smile, towards the open window, so that I had, for the first time, a profile view of him. I principally directed my attention to the eyes and nose. This moment of observation, when he did not look at me, was to me particularly valuable."

"I can readily admit," continued the monarch, "that much of the power of a man's mind, of his disposition, temperament, and passions, may be discovered from his countenance; but integrity and sincerity—oh! these are very difficult to discover by the features. With respect to these, you must be extremely careful and attentive. There is too much dissimulation in the world."

"There certainly is much," answered Lavater; "and, undoubtedly, probity is much more difficult to discover than understanding, wit, courage, and temperament. We may assign many outlines and traits of which we can say with certainty, where these appear in a countenance, there is much understanding. But it is not thus with respect to probity. Notwithstanding this, there are certain measures of power, wisdom, and goodness, which may be combined in such just proportion, that integrity must almost necessarily be the result. Now, each of these ingredients which compose integrity, has its appropriate signs; and their harmonizing may be expressed by the harmony of the features. A great portion of goodness, benevolence, and firmness, which form the basis of probity and integrity, cannot easily be mistaken in a countenance."

"Do you not find," said the emperor, "that character in the female sex is much more difficult to ascertain, and, in fact, that there is much less of peculiar character in that sex than in men?"

"In certain respects," replied Lavater, "I must answer in the affirmative; in others, in the negative."

He smiled sarcastically, and, with the significant air of a man of experience—"Women," said he, "are governed by men, and apt at imitation. They have no character of their own, and assume any that they choose. Their character is that of the man whom, for the time, they wish to please. They perhaps meet with one who is serious, sedate, and prudent, and who, in some particular or other, pleases them; immediately they are sedate and serious. Soon after, another comes, who is gay and lively, and, as they have not attracted the notice of the former, they now become lively and gay, merely to please their new associate. What, then, is their character? Who can ascertain their disposition from their countenance? The physiognomist may study them a long time, and when he thinks he has obtained certainty, on a sudden they are totally changed."

"I admit," answered Lavater, "that these remarks of your excellence are, in general, well-founded, and that it is, to a certain degree, undoubtedly true that women are what they are, only through men; or rather, that they assume, in the presence of men, the character which they think most proper to be assumed: yet, at the same time, there are certain firm, unchangeable, undisguisable features, tokens of the internal basis of their character, in which the physiognomist will not easily be deceived. It indeed cannot be denied, that, as their physiognomy is less bony, less projecting, less strongly delineated, it is not so easily to be defined as that of strongly-formed, firm-boned men. But if we always, in the first place, direct our attention to the grand outline and form of the countenance, we shall not greatly err. It can never be sufficiently repeated, that there is so much in every human countenance, that is independent of all the arts of dissimulation, that we ought not to fear those arts; only the moveable features are within the influence of dissimulation; the real countenance, or the basis of those features, is beyond its power."

"But consider," said the emperor, "should you be able to assign precise principles, and your observations become a certain and attainable science, what a revolution you must produce in the world! all men would view each other with very different eyes."

"I confess," replied Lavater, "that my head frequently turns giddy only at the thought of all the changes which physiognomy might produce in the mass of the human race; but it will produce no such changes."

The accuracy of this lively epitome of the doctrines of Lavater cannot be doubted, since the words are his own. Many readers will be surprised to find in them so little that is vague and mystical, considering the strong impression to that effect which is almost every where entertained. The truth is, however, that these ideas have been generated, not by the opinions of the founder of the science himself, but by what injudicious followers have engrafted upon it. He was enthusiastic, indeed, in his speculations as to the results of physiognomy, and perhaps attributed to the study of it too great a degree of importance; but, in the data he lays down as the groundwork of the system, in his statement of observed facts, and in his deductions from them, he will be found to be cautious and exact.

BEES AND MICE IN CANADA.

Bees thrive very well in Canada; the honey, however, is not of the first-rate quality, owing to the flowers not being so plentiful as the trees. Plenty of good mead might be brewed, and we are surprised not to find this done. In winter, the beehives are housed in, which serves to protect them against the inclemency of the weather. There are numbers of bees in the woods, with their nests in the hollow trees; but their sweet treasures are not much sought after, except by the bears. Once, when in the woods, we came upon a settler cutting down a large tree, by the banks of a river, on which his bees had swarmed; but, long before he cut down the pine, the hive had taken the alarm, and moved off to where they would not be disturbed.—Mice are not numerous, and seem to be very diminutive in size. I have seen them in places where food was very plentiful, and yet they never looked fat and plump, like those seen at home. The Musk-rats build their nests of bent, in the marshes and grassy edges of the rivers; in winter-time, when the frost withers the herbage, their nests are seen sitting in the ice, like so many large beehives.—*Mactaggart's Three Years in Canada.*

ARISE, MY LOVE!

Arise, my Love!—my Ladye bright!
The merrie lark is up!
The sun hath kissed, with lip of light,
The daisy's silver cup.

The dappled doe is out at play
Upon the grassy hill—
The cushat weaves a tender lay
Beside her favourite rill.

All pretty things are moving now,
Like dreams, in azure light,
Yet none are half so fair as *Thou!*—
Arise—my Ladye bright!

No. 60. SATURDAY, MARCH 23, 1833. PRICE THREE HALFPENCE.

INTENTIONS.

THERE is an old Spanish saying, that hell is paved with good intentions. For the extent of the commodity, the earth might be paved with them too; and then they would be very much in their proper place with respect to mankind, for there is nothing we are so perpetually trampling under our feet. What a great and glorious world this would be, if it were to be estimated by intentions! Even amongst the humblest of us, and in the humblest details of our humble lives, what fine intentions we are always forming! We might all be gods for our intentions. The very thief, the day before his being finally captured and put on the road for the gibbet, had excellent intentions. The old abandoned sinner, the hour before he was struck by the mortal illness which carried him off, had the noblest intentions. The most virtuous and devout man in the country never had better, if so good. Oh that we could all be judged by our intentions!

In plain positive truth, these same intentions are the most pernicious things in the world; and men ought rather to be condemned, than excused, for entertaining them. If a man has no good intentions, he knows that he is decidedly wicked, and has the chance of being some day roused to a sense of his unrighteous state, and thereafter becoming reformed. But the man of good intentions goes dreaming on all his life, in reality a wicked and erring creature, but constantly absolving himself from his sins through the efficacy of this pretended virtue, which only permits and urges him to sin more. Far honester and far safer is he who does not pretend to conceal either from himself or others that he is a wretch, than the mean dastard who sneaks into a good character with himself, and at the same time deceives the world, by an assumed and fallacious merit. In fact, every good intention, not in proper time carried into effect, is a palpable offence; for, but for it, we might have felt the necessity of *doing* some lesser good: it only tends to supplant the performance that might have otherwise taken place. Good intentions tickle the conscience till it sleeps, and then carry their victim forward, in blind and fatal security, to destruction.

As all men think all men mortal but themselves, so also do all men think all men liable to moral rebuke but themselves. When we hear some fervent pulpit admonition, accompanied by a justly severe view of the deceitfulness of human nature, we think that all this is very proper for people in general, but never once suppose that we, in particular, are in the way of needing it. In the same way, it is by no means unlikely that many individuals who read this little essay will say, either in words or thoughts, How just the writer is upon thousands whom we know! But not one in ten, perhaps, will bring the moral home to himself, and inquire to what extent *he* may have been guilty of only meaning well. *This, however, is what every one should do.* We would indulge the hope that many might thus receive a shock sufficient to awake them from the dream of good intentions, and henceforward endeavour to *do* what they have hitherto contented themselves with only *designing to do.* Let every one be on the watch for the least symptom of an intention which is excluding a performance. Let him open his eyes to the injury likely to result from such a habit. Let him reflect, when he sees another die without performing something which ought to have been done, that probably that individual had just as good intentions as any one ever has—only, as usual, he was cut off while in a state of dalliance with the performance. So blind are men, that we have heard an individual rail in no very measured terms at a neighbour who had died without doing a certain thing which he seemed to consider necessary; and when the railer was asked if he, who was in exactly the same circumstances with the deceased, had taken care to do that duty, he confessed that he had not. Oh no, but he intended to do it. He did not reflect that his neighbour was probably as much alive as he was to the propriety of doing the duty in question, but had always, like himself, been content with the intention. The uncertainty of life might have shown to our friend that he was liable, in one moment, if it so pleased God, to be in the same liability to blame as his deceased neighbour; but then how few ever reflect on this tritest of all truths!

Thus it is that men go on—doing many things which they ought not to do, but, as for the good which they *ought* to do, contenting themselves, in a great measure, with intentions. Intentions serve mankind instead of positive good; but we have heard wonderfully little of any similar or corresponding thing for preventing evil. Wrong is a reality—good, it would appear, little better than a fancy. The question, however, arises, Will this please the Being whom we serve, and who is at last to judge of our earthly merits? Assuredly it will not. Before the seat of that Being, we will be interrogated respecting our *deeds;* and how will the gauze of *intentions*, when we hold it up, appear in that mighty Eye, if deeds be wanting to prove the reality of those good principles which we have professed?

Even considered as a matter of worldly wisdom, the necessity of substituting performance for intention is obvious. No one ever gets rich upon intentions. It is only in so far as a man *acts* that he acquires any thing. He may entertain the most earnest intention to do something, and spend a whole day in fixing it in his mind. But, in the words of the English proverb, it will butter no parsnips. No, nothing but the actual work gains the money. Even in those numerous details of life which are not connected with the winning of our bread, but only tend to conveniency and courtesy between man and man, intentions serve to as little purpose. If we sincerely want to accommodate or befriend our neighbours, we must really bestir ourselves for the purpose, and actually write the letter, or go the errand, or pay the visit, which may be necessary. Nothing *tells* but the performance. In reality, the *action* often costs less trouble than the contemplation of it. We often voluntarily triple the sacrifice, by encumbering our minds with a load of intention, and keeping it there for hours or for days, when we might have at once relieved ourselves by doing what we always knew we could not avoid doing. We do not tell our young friends never to intend doing any good or useful deed; but we are most anxious that the action should follow the intention almost as rapidly as the report of a musket follows the ignition of the powder. Delay is the canker of human life. There is nothing done well that is not done at once with promptitude and decision, and, if necessary, pursued with diligence. Let us hear no more, then, of this wretched cant about intentions. Do not let us hear people who are burnt out talk of the hardship of losing all, when they had *intended* in a day or two to effect an insurance on their property. Do not let us see families launching out into expenses they are unable to support, and reconciling it with their conscience by saying they *intend* to be more saving next winter. Away with such deceptions! Let us see men go at once to the point, and do that which it is their duty to do, and not fritter away their time with those meaningless make-believes, which are as discreditable to their intellect as they are injurious to their interests.

FELLOW PASSENGERS.

THE life of every individual, however humble his station, and however really insignificant he may be in point of intellectual endowments, contains something or other which it is worth while to know, and which, if recorded, might supply matter of useful reflection to persons of the most exalted attainments. The faces of men are not more various than their character and fortunes. Something is happening daily to every one of us, which forms the subject of conversation in our respective domestic circles; and if we do but go abroad into the city upon some piece of business, our return home is frequently looked for with as much anxiety as the arrival of a foreign courier in Downing Street, being fraught, to our private affairs, with consequences in which those connected with us take a far more lively interest than the nation at large, or its rulers, can possibly do in the fluctuations of continental politics. When we consider the multiplicity of transactions in which we have ourselves been engaged, and the singularity of some circumstances that have fallen out in the course of our experience, and that every person we meet is conscious of a history as peculiar, and, probably, as diversified as our own, we obtain an almost boundless idea of the hidden stores of curious particulars which a limited neighbourhood, to say nothing of a large city, could disclose to the world. Even within the moving box called a stage-coach, is often contained a little society, the members of which have been brought together by incidents, which, as they are various in themselves, are the objects of mutual curiosity, and might form the foundation of the most excellent maxims and resolutions.

Of the four insides who started from Edinburgh on the 19th day of October—the year is of no consequence—one was an elderly man, with a grave but yet benevolent and cheerful cast of countenance. He was accompanied by his son, a boy of about fourteen, with harder hands, and a look of being more inured to labour, than was to be expected from his dress. The occasion of their present journey was as follows:—From some attractive narratives of the adventures of navigators, of the wonders they have witnessed, and the glory some of them have acquired, the lad had become enamoured of the sea service, and nothing would serve him but he would be a sailor. His friends endeavoured to dissuade him from this resolution, and laid down various plans for pushing him forward in other more gainful and less hazardous, but entirely unromantic professions. The visions of an inglorious affluence could not compete, however, with those more splendid chimeras which had gained possession of the boy's imagination. The bent of his mind remained fixed, and his father, seeing no arguments could produce any effect in changing it, appeared to yield to his wishes. An assurance that he should be permitted to make a trial of the occupation which was so much the object of his desires, made him perfectly happy. He went about in a state of the greatest excitement for some days, arranging in his own mind the numerous gallant deeds he was to perform; the dangers he was to escape; the scenes of softened beauty and of gloomy grandeur he was to behold; the spectacles of barbaric pomp—crowds of black men in white garments, glittering in armour of gold, and mounted on superb coursers—which were to pass before him. Floating banners, yawning gulfs, odoriferous flowers, stately palaces, roaring waves, all commingled, and formed one great incongruous idea, which made him utterly despise the whole of the insignificant objects in his native parish, and exult in the prospect of entering in a few days on board of a vessel at Leith.

with the master of which his father had agreed that he should go a voyage to Dantzic, in the course of which he himself made no doubt of achieving some notable adventure. Never boy was prouder than he when he first trode the deck; and the offices he was employed in were performed with an alacrity, and, at the same time, a feeling of magnanimous composure, as if he were already acting a great part in the eyes of the world. His father's arrangement with the captain was, that he should not be treated with any unusual harshness, but that he should work, be clothed, fed, and lodged, in every respect, the same as an ordinary cabin-boy. He himself would have disdained to enter the ship upon any other footing; for it would have been unworthy of one resolved, as he was, to rise to the first eminence solely by his own merits, to start in any capacity the least degree above the lowest. His bones, unused to labour, ached a good deal at first; and when his limbs were better strung for work, he became heartily disgusted with the drudgery and common fare. He could not perceive wherein lay the honour and glory of "jumping" at every one's bidding, scrambling among ropes the whole day, which was not half so pleasant as climbing for birds' nests, from which he could desist when he pleased; and then the tears came into his eyes when he crept to his hammock, full of the recollection of his little comfortable bed-room at home, where his mother often looked in, to speak an endearing word to him before he fell asleep. When the voyage was over, and his father met him at Leith, with offers, as he had been so anxious to acquire a proficiency in seamanship, to transfer him to a vessel about to sail immediately for another port, without the least hint of taking him, even for a few days, to visit his friends, the poor little fellow's heart was like to burst, and he fairly confessed that he was tired of sailoring. He was now on his road home, perfectly willing to adopt any profession which the better judgment of his parents thought proper to select.

What a lesson is here in respect to the management of rash and inexperienced youth! Had the father positively persisted in refusing the wishes of his son, and in forcing him into some more eligible pursuit, he might have kept him at home for a time, but with a mind rankling with discontent. Probably he would have taken his own way after all, and with such a confirmed opinion of his father's severity, that recal would have been impossible. The method taken to open his eyes to reality was the only one that could prove effectual.

The third passenger was a sickly young man—a poor scholar—whom hard study and anxiety had plunged into consumption. The story is one that is well understood—there has been too often occasion to tell it. His father's means exhausted in the first years of his education, and he cast upon his own inadequate resources; on the one hand, ambition of usefulness and of honourable fame; on the other, the fear of destitution. Who shall tell the brilliant hopes, the bitter disappointments, the loss of spirits, the loss of strength, the want of elasticity, the feeling as if the bones were sapless, and the blood no more ran in equal currents, the consciousness that all past exertions are vain, that all future hopes are vain, that this is a drooping unto death—can words express all these? Then the recollections that visited the poor patient—the deceitful fancies! He thought if he had a drink from the spring from which his mother used to draw water, it would refresh and restore the fading powers of life; he thought, as he gasped in his small close chamber, of the healthful breezes and balmy air of his native vale, and that, if he could but breathe a draught of it, he would be well; he thought, and here there was no delusion, that if his mother could watch his last moments, and minister to his wants, death would come in a less cheerless and repulsive form; and he was now on his way to realize this the only earthly solace that remained for him. The victim of a love of knowledge is not altogether excusable; but who shall have the heart to blame him?

The fourth occupant of the coach sat in one of the corners, as straight up as the fishing-rod which he held beside him, and as silent. He seemed to be rapt in an endless vision of a "glorious nibble." Being in the soundest health, of the most imperturbable mind, and in good condition as to person and clothing, he might be held a good example of the fruits of moderate wishes steadily pursued.

At the country town where the coach stops, a great crowd of persons stand round, every one more eager than another to see what kind of persons will come out of the coach, and farther, to learn their names and business if possible, that they may run home with the intelligence immediately. But we do not require to say another word as to the history of our fellow passengers. Whatever may be the interest which such companions excite while beside us, no sooner does the vehicle of conveyance arrive at its destination than all further concern generally ceases. Each hurries off to his own house, forgetful of his late fellow traveller, whose countenance is never more recollected, unless, perhaps, when we are startled into remembrance by seeing it gleam past us in a crowd, stirring up for an instant a partial reminiscence of past days and pursuits

A STORY OF THE FRENCH REVOLUTION.

Soon after the beginning of the French Revolution, a peasant named Pierre Henriot lived in a little hamlet about thirty miles from Paris, and worked in an olive ground hard bye. This man had a son and daughter, whose mother died when they were very young. Pierre's wife was a good woman, and, had she lived, would have trained her children in the paths of virtue; but they were most unfortunate, as will be seen, in being left entirely to the care of their father. This man had been long in the service of a nobleman, whose chateau was situated in the neighbourhood of the hamlet, who had incurred his most malignant hatred from having requited his services less liberally than he fancied they deserved, and from having taken a fancy to educate a nephew of Pierre's wife, while he took no notice of his son. This orphan nephew had shared with her own children in the care and affection of his aunt; but at her death, poor Jaques was so shamefully neglected, that he became the talk of the neighbourhood, which induced the old housekeeper at the chateau, who had been the friend of his aunt, to take him under her protection. Here the owner of the mansion, attracted by the handsome appearance of the boy, and discovering, in an accidental manner, that he had a genius for learning, had him instructed, and, thinking that he would perform a meritorious action in making him a priest, sent him a few years afterwards to a monastery at Paris, to prepare him for that office. This proved a most unpardonable offence in the eyes of Pierre, who possessed a malignant, morose, and envious disposition. It was true, this protegé of the Count de Bigot had offended him, by at length refusing to become a priest, and had been entirely cast off from his favour in consequence; but this made no change in the sentiments of the implacable Pierre toward his old master.

Pierre's son and daughter were now grown up. The son partook much of his father's disposition; his fierce and violent passions always contending for the mastery over him, and becoming the constant occasion of involving him in broils. His sister Charlotte was extremely handsome, both in face and person; but vanity was so strongly depicted on her countenance, that no sensible person could look on it without pity or disgust. This contemptible passion had been fostered from her earliest childhood, by the folly of her father and brother, who were in the constant practice of telling her how pretty she was, and predicting that she would make her fortune by her beauty. This she most cordially believed, and, therefore, refused the offers of marriage made her by the young peasants in her neighbourhood, while nothing gave her greater pleasure than to gain their affections, and boast of it with the most insolent and unfeeling levity. This conduct rendered her, by the time she had gained her twentieth year, an object of detestation to her acquaintance of both sexes, and caused them to forsake her society. If this girl had in reality ever cared for any one but herself, it was for her cousin Jaques St Croix, who had ever treated her with the affection of a relative, though he had severely piqued her pride, by appearing insensible to her beauty; and it is probable he owed the preference she felt for him to the pains it had cost her in her endeavour to ensnare him. But we must make our readers better acquainted with this young man, by detailing his history from the time he was sent to Paris by the Count.

In studying that religion of which he was intended to become a priest, Jaques, who was clever and discerning, acquired a distaste of the pursuit, which was observed by Henri Hebert, a distant relation of his, whom he was in the habit of going to see as often as his studies admitted of it. This old man was a French Protestant, and a manufacturer of cutlery, who had saved a decent dowry for an only daughter. He was a pious man; and having always had a high opinion of Jaques's moral qualities, he questioned him on his apparent depression of spirits. Jaques, who was at first reserved, made his kinsman at length acquainted with all his scruples, and received from him much instruction and good advice. But it remained for the daughter of the old man, the gentle and unassuming Marianne, to complete the conversion which her father had begun. This girl's features were not beautiful, like Charlotte's, but there was a fascination belonged to them; for there was spread over them an expression of intelligence, and of benevolent good humour. Nor was her figure or her step so light and graceful, but there was an air of placid activity in her movements which announced self-possession, and a great degree of dexterity in her usual avocations. In short, Jaques renounced his intention of being a churchman, and, with the full consent of her father, became the husband of the good Marianne. This happened when the Parisians had been for some time talking loudly of tyranny, of equalization, and of liberty, and when every sensible and thinking person foresaw, from the fermentation in the public mind, that a civil war was likely to be the result. With this impression, Henri Hebert sold off his goods, and having purchased some acres of fruit ground, which happened to be for sale, near the hamlet where Jaques's uncle lived, and to which his son-in-law was attached, from its being near the place of his birth, he removed with him and his daughter to this quiet spot, and bid farewell to the city and its turbulent inhabitants. Here they lived happy and industrious, setting an example of contentment to all around them, which it would have been well for Pierre Henriot and his family if they had followed. But the restless and evil disposition of this man and his son prompted them, instead of applying themselves diligently to their work in the olive grove, to go constantly from place to place, to learn or repeat the newest intelligence of all the acts of violence then committing at Paris. Of those acts they would fain have been participators, while they spared no pains to spread the evil contagion of their pernicious principles, by every art in their power, among the weak-minded of their neighbours. Nor was this by any means difficult, at a time when so universal a spirit of discontent prevailed; for, when a train of gunpowder is already laid, a single spark will cause it to explode. Thus the peasants in this retired spot, and for many miles round it, who had never before, during their lives, thought of any thing save alternate working and dancing, fancied they perceived that the time had arrived when it would be expedient for them to take the law into their own hands, that they might wreak their vengeance on the aristocrats, and possess themselves of their property. Several instances of such outrages had lately occurred in different provinces, when at length the Count de Bigot was denounced at Paris as an enemy to the people; and a band of ruffians, headed by a person who had risen into consequence from his adherence to the head of the reigning faction, arrived one evening at the hamlet, in order to stimulate the people to assist in taking the Count into custody, informing them at the same time, that, if he surrendered himself quietly, he meant to convey him to Paris, to stand his trial; but in the event of resistance from himself and his attendants, he must reap the reward of his folly, by meeting his death on the spot. As it happened, this unfortunate nobleman, though not in the main a bad person, was repulsive and haughty in his manner, and had been in the habit of delegating too much of his authority to inferior agents, who had not always made a good use of it. He was therefore not a favourite with the surrounding peasantry, who had been but too often oppressed in his name. Jaques was present at the harangue delivered to the peasants, who assembled to the number of two hundred, from the adjoining country, and was shocked at the eager joy they manifested on the occasion, but at nothing so much as the expression of savage exultation and self-congratulation manifested on the countenance of his uncle Pierre; and when he looked at him, and remembered his long-cherished hatred of the Count, he felt assured that the unfortunate nobleman had small chance of leaving his chateau alive. He knew, also, that if he did reach Paris, it would be only to endure the cruel insults and sufferings inflicted on all who entered it under his circumstances, before he made his exit on the scaffold. Jaques felt assured of all this, and, remembering that though he had cast him off from his favour, he had been many years his benefactor, he determined to save him if he could. He therefore slipped unperceived away from the crowd, before they had done listening to the man who was addressing them, and ran as fast as he could through the shortest and most unfrequented paths of the wood, to where the chateau lay embosomed, about a mile off. Jaques's long residence at this mansion had rendered all its modes of access, as well as its master's habits, familiar to him, and he made for a small court, from which a door opened at the foot of a back stair. Here he ascended, and having, without being perceived, reached the library, where he knew the Count would most probably be at that hour, he entered it, and, standing suddenly before the astonished nobleman, who appeared to experience some degree of alarm at his abrupt appearance, he said, "Fly, my lord, from this place instantly—you have been denounced as an enemy to the people, and the ruffians who are to convey you to Paris, or to sacrifice you here, are near at hand, followed by a multitude, all apparently thirsting for your blood." The Count looked at Jaques with an uncertain and jealous expression in his eye. "And on whose authority am I required to believe this?" said he. "On that of a heretic, who has requited all my benefits with ingratitude, and who may now, for aught I know, have forced himself into my presence with some evil intention?" "Not so, believe me," replied Jaques, while his open manly countenance, on which the utmost anxiety was expressed, gave the stamp of truth to his words—"but on the word of a grateful man, who feels so sensible of your past kindness, that he now puts his own life in hazard to save yours; quick, I beseech you—if you have money at hand, secure it, and let us be gone instantly." The Count was convinced. He rose, and, taking a considerable sum from a desk in the apartment where they were, he followed Jaques by the way he had entered, without meeting any one. Nor was it till they had dived some distance into the woods, that he ventured to interrogate his companion on what he had seen and heard relating to himself, or to ask his counsel as to what hiding-place he would advise him to seek, till he should learn the result of the night's proceedings. To these questions, Jaques answered by giving him a faithful account of all that had passed at the hamlet, and by assuring him that he felt persuaded he would be nowhere so safe as in his cottage, provided he could conduct him to it without observation. He then left the Count, and set off to reconnoitre the hamlet. There all was solemn stillness: for its inhabitants, man, woman, and child, except his father-in-law and his wife, had all followed the

multitude to the chateau. This was exactly as he wished it; and, returning to the wood, he conducted the Count to Marianne, whom having charged with his safety, and pointed out a place of concealment not likely to be discovered in the event of a search, he retraced his steps with all possible speed to the scene of action, not only to gain all the information he could, but to prevent suspicion from lighting on himself, through his absence.

This suspicion he was fortunate enough to prevent, by returning in time to place himself among those who were trying to force the door of the principal entrance, having been retarded in this operation by the manner in which the affrighted servants had barricadoed every avenue of access. The time lost by this delay enraged the mob so much, that they began to vociferate deep and bloody threats against every inmate of the dwelling, when Jaques suggested that they should give a promise that none of the Count's attendants should be injured, provided the doors were immediately opened. This advice was adopted, and, after a short parley, in which the terrified domestics required the promise to be frequently reiterated, the doors were flung open, and the mob rushed in with shouts of triumph. They ran through the various apartments, breathing imprecations against the Count, and searching every nook and cranny for their victim. Nor is it easy to describe their rage and vexation, when at length they were convinced that he had escaped them, although they had taken the precaution of surrounding the house on their first approach. In short, his having eluded them was quite inexplicable, as the servants, when separately examined, all agreed in averring (what they believed) that he was in the chateau when the mob first made their appearance. The fury engendered by this disappointment showed itself in the most wanton acts of violence. The splendid furniture was soon broken in pieces, and the mansion pillaged of all the more portable things of value, such as plate, jewels, and linen. During this scene of plunder, Pierre and his son were foremost in the work of destruction, and busily employed in securing such things as they particularly fancied; while Jaques, who knew where the Count's most valuable papers were deposited, busied himself in filling his pockets with those documents, and taking a few of the trinkets which he knew were most prized by their owner, in order to restore them to him. It was fortunate for the Count and Jaques that the revengeful spirit of Pierre never entertained a suspicion that his nephew could be in league with the man who had cast him off from his favour, and as he saw him constantly among the most inveterate of the rabble, he felt perfectly convinced that he was, like himself, acting from a spirit of retaliation. This exempted Jaques from suspicion, and his house from being searched; so that, in a day or two, the Count, disguised as a peasant, and having his valuables concealed about him, left the cottage of his deliverer with the liveliest feelings of gratitude, and more toleration than he had ever before felt for heretics. He made immediately for the nearest seaport, and having, under a feigned character, obtained a passport by means of a friend, he embarked for England.

The destruction of the Count de Bigot's property did but lead the way to similar outrages in the province, at which Pierre and his son were sure to lend their aid, while Jaques, who could only lament that many well-meaning people suffered themselves to be led astray by the evil-minded and designing, continued his unwearied industry, and, in spite of the unsettled state of the country, found bread for his family, and contrived to live in peace. This peace was, however, broken in upon by an event which cost him much pain. The kind-hearted Marianne had done every thing in her power, from the time of her becoming his wife, to wean his cousin Charlotte from her light-headed silly ways, and to persuade her to become useful to herself and others. This Jaques began to hope she had in some measure achieved, when, to his surprise and vexation, he was informed that the person who had headed the band from Paris in search of the Count had been seen in the neighbourhood of the hamlet the night before, and that Charlotte, to whom it appeared he had taken a fancy on his first visit, had gone off with him. Jaques would have immediately followed, but was prevented by her father and brother, who, furious at her betrayer, who they imagined it probable would soon abandon her to misery, expressed their determination of bringing her instantly back. This satisfied Jaques for the time, for he knew that the pride they took in her beauty had produced a love for her in their savage hearts not the less strong that its motive was erroneous. When Pierre and his son reached Paris, and demanded admittance at the splendid mansion which had been the residence of one of the proscribed noblesse, and of which Charlotte's lover had become possessed during the unsettled state of property in the capital, they were immediately, on telling their names, conducted into the presence of its usurper. It was the policy of this bad man to be always obsequious to the common people; and he was now doubly so to those men whom he had observed narrowly on the night the chateau was pillaged, and thought he discerned in the savage joy with which they aided in the work of destruction, and the deep curses they lavished on the owner, and on aristocrats in general, that they were fitting tools for the times. He believed that he could employ them to advantage, whether a mob was to be inflamed, an enemy denounced, or a murder committed. They were, however, at that moment in no humour to be cajoled, and assailed him with a torrent of the vilest abuse, while they brandished long knives which they had hid under their garments, and threatened to dispatch him instantly if he did not immediately produce the girl of whom they had come in search. Thus confirmed in his opinion of their ruffianly qualifications, he condescended to soothe them by an assurance that they should immediately see Charlotte, and learn from her own lips whether she had any cause of complaint. He then led them through a sumptuous suit of apartments to one more gorgeous than the rest, where they found the unfortunate girl reclining on a couch, dressed in the most expensive and gaudy fashion of the day, and surrounded by the most luxurious appointments, many of which, though she admired them as pretty toys, she did not even comprehend the use of. But, to be brief: her father and brother were so much dazzled and gratified by seeing the apparent mistress of so much splendour, that they were easily persuaded to join the *good citizen* in deriding the old fashioned and slavish ceremony of marriage, though the father thought proper again to brandish his knife, and accompany the action with a threat in the event of her ever being cast off. But this was a supposition at which the weak-minded Charlotte smiled in scorn, as nothing less than high treason against that superlative bounty which had raised her to such a pitch of grandeur. Alas! where may we expect next to meet her?

But we must now return to Jaques and his family, who had heard nothing of Charlotte for several months, save that her father and brother had seen her, were content with her situation, and had themselves determined to remain in Paris. Unsatisfactory, and indeed grievous, as this account was to these kind-hearted people, they endeavoured in some measure to console themselves, by hoping that Charlotte might one day be convinced of her error, and return to them; and they resolved to receive her with open arms, as a stray sheep restored to the fold. What, then, was their horror, when they learned from a person who had just come from Paris, and who knew her, that the man with whom she lived had shared the fate of the head of the faction to which he had attached himself, and was guillotined; that no one knew what had become of Charlotte, but that her father and brother were both in the prison of the Conciergerie, charged with being emissaries of her late lover! For a day or two after these tidings reached him, Jaques appeared restless and miserable, but he was not long in determining what to do. He hoped, that if he could now find Charlotte, he would be able to extricate her from the maze of vice and wretchedness in which she must, without his interference, be for ever involved. He thought of her as he had last seen her—weak, vain, and degraded, but still innocent of heinous crimes. He thought of her former preference for himself, and he felt that he owed it to that unrequited preference—to the memory of her mother, who was the unwearied friend of his childhood—and to humanity itself, to make every exertion to save her.

The disinterested and benevolent Marianne could not but approve of her husband's determination to seek his unfortunate cousin, though she shuddered while she embraced him at parting, at the dangers to which he would probably expose himself.

It was night when Jaques reached Paris, but there was none of that stillness there which is its natural concomitant. At that hour, all was hushed in the little hamlet he had left. In his own cottage, his aged father-in-law was enjoying, on his pillow, the rest and peace which is the reward of a well-spent life, and an approving conscience: his dear Marianne was sleeping the sleep of innocence, with her infant in her bosom. But here, the contrast was most appalling—the drums beat—fire-arms were shot off—screams and oaths, and discordant laughter, met the ear—grey-haired old men were joining in street brawls and drunken revels; and, in place of the care and tenderness of the decent matron, who soothes her child to its quiet slumber, mothers were seen hurrying to and fro with their infants, through the night air, apparently insensible to their wailing appeals. All was heart-sickening to the sober and reflecting Jaques, and he hastened in search of the unfortunate Charlotte: but all he could learn was, that upon the apprehension of the man she had lived with, she had fled to her father, but what had become of her when he was taken to prison, no one knew. There was nothing for it, then, but to endeavour to learn from her father and brother, by means of the jailor, where she was. This, Jaques well knew, was a hazardous experiment, but if he did not attempt it immediately, dangerous as it was, it might be rendered vain, by their lives being cut short. He therefore turned his footsteps toward the Conciergerie. While he was yet some distance from the prison, his passage was impeded by a dense and unruly crowd, from whose vociferations he learnt that they were waiting for their nightly pastime of accompanying the condemned prisoners to the guillotine. Presently the renewed shouts and agitating motion of the crowd informed him that the victims had ascended the fatal cart, and, in a few minutes, he beheld it on its way, while he was compelled, by the pressure of the multitude to accompany them to the place of execution, and hurried almost to the very foot of the scaffold. Jaques's first determination was to shut his eyes, that he might not look on the bloody scene; but an indefinable curiosity took possession of him, and he raised his eyes just as two men were placed upon the platform. His very eyeballs seemed seared when the light of a lamp gleamed full upon the deep furrows of his uncle's sullen and ferocious countenance, while he sent forth a scowl of defiance on his executioners, as they dragged him forward, and uttered a brutal jest on the meetness of the father's taking precedence of his son. That son had hardly time to look on the ghastly features of his father, as his head lay on the boards of the scaffold, till the stroke descended that laid his own beside it. Jaques, whose wan and quivering features showed the agony of his soul, was at that moment prevented from uttering an ejaculation of horror, which might have proved fatal to himself, by the frantic screams of a woman who was not far from him, and whom the mob were contending about—some crying out that she belonged to the men who had just suffered, and others contradicting this, while they derided her as one whose cowardly spirit disgraced a Frenchwoman, who ought to be able to look with joy on the execution of the enemies of the people. Jaques heard all this, and rushed forward to the spot, where he beheld the wretched Charlotte thus subjecting herself to the danger of sharing the fate of her father and brother. This danger became still more imminent, when she was presently recognised by a person near her as the mistress of a man who had lately been executed; and the fearful cry of—"To the guillotine with her!—to the guillotine!" began to be raised. But just at that critical moment a fresh arrival of numerous victims attracted universal attention; and Jaques, seizing her firmly round the waist, dragged her through the crowd, while he endeavoured to soothe her by every means in his power; and, hurrying her through bye-lanes nearly emptied of their population, he at length succeeded in placing her in the house of a friend for the night. Jaques's first care in the morning was to procure a conveyance for himself and his wretched cousin, in which they that day reached his home. This was, however, rendered no light task to him, by the necessity it imposed of hearing her frantic ravings, in which she accused herself of the miserable end of her father and brother. When Jaques alighted at his own cottage, and Marianne flew to meet him, his pale countenance, his dark eyes sunk in their sockets, and the expression of melancholy pourtrayed in his whole frame, told what he had suffered since she had parted from him—while the wretched Charlotte seemed to gaze with a vacant and idiot stare on all around, till roused, by some sudden recollection, into ravings of mad despair.

Poor Marianne looked upon her husband, and his unfortunate cousin, and her deep and silent tears flowed fast, as he related to her the dreadful story of his journey. This good young woman did all that was dictated by her sound sense and kindly feeling, to restore Charlotte to some degree of composure; but month followed month, and little change could be perceived, save that she did not express her remorse so violently in words. She, however, seldom tasted food, and seemed to loath the light of day; and grew pale, emaciated, and feeble; and that beauty which had been the primary cause of all her guilt and misfortunes, fled, and left behind it nought but a desolated ruin. It was in vain that she was visited by the Catholic priest of the district; the absolution he pronounced seemed to carry no comfort with it, and she soon sank into an early grave, the victim of cold-hearted vanity, and the other evil principles so early instilled into her by her wretched father. It was long before Jaques could conquer the melancholy left on his mind by the dreadful fate of his uncle and his family, and his heart sickened as he stood beside the premature grave of Charlotte; and, looking through time into eternity, meditated long on the fearful nature and prospects of vice; till the current of his thoughts gradually assuming a more placid and encouraging course, he thought of the blessings of virtue, and returned to his amiable wife, and his usual avocations, with recovered serenity. Nor was the quiet tenor of his life thereafter interrupted.

SUMMER AND WINTER.

HAD it not been for what, on a casual view, might be considered as a comparatively unimportant and almost accidental position of the earth, in relation to the great circle by which it annually moves round the sun, the change of seasons would have been totally unknown throughout the globe. That imaginary line passing through the south and north poles, called the earth's axis, instead of forming an exact perpendicular with the plane of the circle around which the earth goes annually round the sun, is inclined from it at a small angle; or, to make this more comprehensible, if we fancy a round flat plate to represent the plane of the circle in which the earth moves, and take an egg to represent the latter body—the egg is not placed with its one end pointing directly upwards, and the other directly downwards, but one end is inclined a little over in the direction of the middle of the plate, and, as it is thus carried round and round, preserving the exact position—it will be found, that, at one side of the circle, the upper end or north pole will point or

be turned upwards to the centre, while on the opposite side it will be found to point outwards, or away from the centre. At half the distance between, on each side, it will, however, stand in nearly a perpendicular position. If we remove the plate, and place in its stead a lighted candle, and then carry the egg round with its end inclined in the same position as before, and if, at the same time, we turn it round so as to imitate the daily revolution of the earth on its axis, we shall find, at the part of the circle where the end or pole of the egg is turned to the candle, that the rays of light will fall on it very directly, and light up more than two-thirds of its surface, while only a small proportion will be immersed in darkness. This corresponds to our summer on the globe, when the sun's rays fall directly on the northern part of the earth, and the days are long and the nights short. If we carry round the egg one quarter of the circle, we shall find, that, as it is turned round on its axis, the light portion and the dark are equal; this is our period of autumn, or equinox, when our days and nights are of the same duration. If we finish another quarter of the circle, we find the end or pole of the egg turned away from the candle; its rays fall in a low and slanting manner upon its surface, the greater part of which is now in darkness, and only a small portion under illumination; this is the season of winter, when the night is long, the day short, and the heat imparted very inconsiderable, in consequence of the low and slanting manner in which the sun's rays fall upon the earth's surface. By carrying on the egg another quarter of the circle, we bring it to the spring, or vernal equinox, when day and night are again equal; and thus every successive movement brings a corresponding change.

Now, it has been supposed by some system-mongers who boldly take it upon themselves to cut and carve on creation, that this same obliquity of the earth's axis might be rectified with advantage, and that, instead of subjecting poor mortals, and the whole animal and vegetable kingdoms, to alternate extremes of heat and cold, a perpetual spring or a genial summer might be made to reign universally throughout the earth. Nothing, however, could be more rash and presumptuous than such a suggestion. In fact, by the present arrangement, the greatest possible diffusion of the blessed light and heat of the sun over every portion of the globe is afforded. Had it been otherwise, had the earth's axis been placed perpendicular instead of oblique, this island on which we live, and every other spot placed in similar latitudes, would never have enjoyed a heat greater than that which we experience in the months of September and March—a heat far below what is necessary for rearing and bringing to maturity the fruits of the earth, and even below what is necessary for the comfortable sensations of animal beings. Moreover, every country between us and the north pole—and the same holds true of the regions around that of the south—would have been for ever frozen up in sterile and lonely frigidity, with not a single plant or animal to cheer the dull monotony of inanimate nature. It is true, with this arrangement a small strip of temperate zone would enjoy perpetual spring, and tropical regions would still possess the sun's fierce and perpendicular radiance; but would this compensate for the low and imperfect heat imparted to more than half the earth's surface? Besides all this, the successive recurrence of the seasons ministers to man's happiness, and affords a pleasure which seems peculiarly suited to his nature —the delight of perpetual novelty. Nothing can be more pleasing than the gradual transition of spring into summer—this again into mellow autumn—and winter closing up the whole, as it were, with grim and relentless grasp, till anon even he relents into the smile of spring.

The present position of the earth, then, is quite in accordance with that beneficent provision which we find extending throughout all nature's works, by which the greatest possible degree of life and enjoyment is diffused throughout all. It is wonderful to think how very near life approaches even to the frigid circle of the poles. At this point, the greatest extremes of light and darkness prevail; so that, in winter, for several weeks the sun never rises above the horizon; and in summer, for a corresponding period, he never sets. Within ten degrees of the pole, plants and animals exist, and even human beings take up their occasional abodes. Although the cold of winter is intense, yet, as soon as summer comes round, the ice melts, the face of the soil appears, and plants shoot forth, and come to maturity with greater celerity than in milder and more favoured climates. It is found, however, that vegetation will not succeed, and no animals will live, when the summer heat does not rise to 60° of the thermometer.

But has the earth always held this position with regard to the sun? Some have imagined, that when Paradise was created, it was otherwise; and that, after the fall of Adam, when the earth "was cursed," the change was effected. Milton, in his sublime and philosophic poem, throws out this hint. Astronomical observations on the other planets of the solar system, demonstrate that many of these have a similar obliquity of their axis. Others, again, have conjectured that a change was made at the period of the deluge, and that this change may have been, in fact, the cause of the latter catastrophe. All those vegetable remains that are found scattered over the strata of the earth, and which, without doubt, belong to a former period of the earth's history, are, in general character and resemblance, allied to the vegetation of tropical climates; and the same remark applies to the numerous skeletons and skulls of animals that are found belonging to the same period—these consisting of quadrupeds resembling the elephant, hyæna, rhinoceros, &c., and of shell animals, unlike to those of northern existence of the present day. Thus, it has been plausibly advanced, that, previous to the deluge, the habitable part of the globe was a zone, embracing its middle for a space on each side of the equator; that here vegetation flourished in great luxuriance; and that both gigantic specimens of plants and of animals existed before mankind had yet increased in any considerable numbers, or spread themselves over every corner of the earth; that, on a sudden, the earth's axis was changed; confusion and destruction took place on its surface; what was dry land became ocean, and the soil and surface, with its vegetation and animated beings, was swept away, and carried even to its most remote parts; and that a new order of things rose out of the ruins of the old.

The earth is calculated to be ninety-five millions of miles distant from the sun; consequently, the great circle which our planet traverses around this body every year, cannot be less in circumference than five hundred and forty millions of miles. This distance is travelled over in the space of 365 days very nearly six hours, a prodigious and almost inconceivable velocity, and yet performed without at all being perceptible to our ordinary observation.

A SCOTTISH MILITARY BISHOP.

It appears from Scottish history, that, prior to the Reformation, churchmen were often as much distinguished for their gallantry as soldiers, as for their piety as divines. Of these clerical warriors no one appears to have been so celebrated as William Sinclair, a bishop of Dunkeld, at the beginning of the fourteenth century. This prelate was known by the appellation of the Military Bishop and the Champion of the Kingdom. Living in the time of the unhappy troubles caused by the attempt of Edward to subdue Scotland, he was frequently called upon to exert his abilities in securing the independence of his country. Once, while residing at his palace of Auchtertool, in Fife, the sheriff of that county went with a body of five hundred men to make head against the English, who had landed in the neighbourhood; but observing that the country was laid waste, and that the enemy kept a good countenance, the sheriff fell back as fast as he could. On hearing this, the bishop armed himself, took horse with about sixty of his people, who were well disciplined, and, soon meeting the sheriff, cried aloud, "What madness is it in you to run away at this rate!" The sheriff replied, "Because the English are more numerous and better soldiers than we are." "If you got your due," says the bishop, "the king would cause chop off your golden spurs. But follow me, and with the assistance of St Columbus, whose lands they lay waste, we shall have our revenge." With these words he threw away the bishop's staff, grasped his sword, and turned himself to the sheriff with this expression, "Do follow me." They did follow him, came up with the enemy, and happily obtained a complete victory. There fell that day more than five hundred English, besides a number who, by crowding into their boat, overset it, and were all drowned. Sinclair was a great favourite of the king (David the Second), who always in conversation called him "my own Bishop;" and the letters he wrote to him were addressed "To our Bishop." He died 27th June 1337, having filled the see of Dunkeld twenty-five years, and was buried in the choir of Dunkeld cathedral, which he built from the foundation; and, in memorial of this work, he caused to be erected on the top of the east gable of the choir of the present church of Dunkeld, a fluted cross, as part of the armorial bearings of his family, which is still standing.

THE FLORIDA.

Many of the vessels which formed the Spanish armada, intended for the conquest of England, perished on the north and west coasts of Scotland. The ship Florida appeared to have been more fortunate than many of her consorts; she found her way to the Bay of Tobermory, on the Sound of Mull, one of the finest harbours in the world. Scotland being then a neutral country under James, the sixth of that name, the Spaniards considered themselves perfectly secure, and remained long in that station, repairing the damages they had sustained, and refreshing the crew and troops.

The Florida was, no doubt, an object of great interest and curiosity in that remote situation, and all the principal families in the neighbouring country and islands were received on board as visitors, where, tradition says, they were hospitably and splendidly entertained. Elizabeth, the ever watchful and well informed Queen of England, had intelligence of the Florida through her ambassador at the Scotch court, and it was ascertained that this ship was extremely valuable: she had on board a large sum of money intended for the pay of the army; she contained, besides, a great quantity of costly stores. The law of nations should have protected the Florida from injury; but Elizabeth resolved on her destruction, and it was accomplished by one of the most atrocious acts, perhaps, ever recorded of any civilized government. The English ambassador soon found an instrument suited to his purpose, and his name was Smollett. We regret to state, that he was an ancestor of the celebrated writer of that name, who himself alludes to this circumstance in one of his novels, apparently unconscious of the inference which followed. This agent of the English queen spoke the Gaelic language, and wore the Highland dress. He went to Mull as a dealer in cattle, and easily found his way on board the Florida, where he formed an intimacy, and, along with other strangers, had frequent opportunities of seeing every part of the ship. He at length found a convenient time for his diabolical object, and placed some combustible substance in a situation where it was likely to produce the desired effect. He immediately got ashore, and made the best of his way southward.

He had travelled to a distance of six or eight miles, when he heard the explosion of the Florida; and the spot where he stood is still marked for the execration of mankind. The ship was blown up, and nearly all on board perished. Together with the crew and troops, many of the first men in the country were destroyed by this perfidious and bloody act, which reflects eternal disgrace on the planners, and infamy on the perpetrator. Tradition states that the poop of the ship was blown to a great distance, with six men, whose lives were saved. Maclean, of Duart, had procured some cannon from the Florida, for the purpose of battering the castle of a neighbouring chieftain; and a few Spanish gunners, who assisted in that service, were preserved by their absence from the ship.

This melancholy story, which would have formed a memorable era in a more public place, is still, in that country, a fertile source for traditionary tales.

The universal belief among the more illiterate natives is, that one of the Spanish Infantas, who is said to have been on board the Florida, became enamoured of Maclean, and that his wife had employed a person to blow up the ship; thus transferring that crime from the Queen of England to the wife of their chief, who was, indeed, very unpopular. It is alleged that the body of the Infanta had been found, and buried with great pomp in that vicinity; that a ship had been afterwards sent by the Spanish government to convey her remains to Spain. It seems, in collecting these remains, the last joint of one of her royal highness's ring fingers could not be found; and it is said that her ghost has often been seen searching for this bone by torch-light. This circumstance is frequently mentioned as authority for the pious caution with which the Highlanders preserve the relics of their deceased friends.

Some Spanish mares and horses had been landed, to pasture, and these remained in the island of Mull. The breed of horses in Mull has ever since been superior, and it still continues so, probably from this cause.

The English ambassador at Madrid having procured information of the precise amount of the treasure which had been on board the Florida, a ship of war was sent by the English government to Tobermory in the beginning of the eighteenth century, with divers, for the purpose of recovering the specie. The wreck was soon found, and many articles were raised, but no money was acknowledged. The ship, however, never returned to England, and it was suspected that she had taken refuge in France, for evident reasons.

In the year 1787, the celebrated diver Spalding made an attempt to recover this treasure; but he failed entirely, as might have been expected, the remains of the ship having sunk into the clay and mud, and totally disappeared.*

SCOTTISH CRIMINAL TRIALS.

HECTOR MONRO.—SORCERY AND WITCHCRAFT.

Immediately after the acquittal of Lady Fowlis, her stepson and prosecutor, the sixteenth Baron of Fowlis, was presented at the bar on an accusation in some respects similar, of which he also was found not guilty, by a jury the majority of whom had sat on the preceding trial. In January 1588-9, this gentleman, being taken ill, sent a servant with his own horse to bring to his assistance Marion MacIngarach, who is characterised as being "ane of the maist notorious and rank wichis in all this realme," and who, as soon as she entered the house where he lay sick, gave him three drinks of water from three stones (probably some sort of rude stone cups). After a long consultation, she declared there was no hope of recovery, unless the principal man of the patient's house should suffer death for him; and it was determined, after some discussion, that this substitute should be George Monro, eldest son of Katherine Monro, Lady Fowlis. A plan was next devised for transferring the *onus moriendi*, for the present, to George; according to which, in the first place, no person was to have admittance to the house where Hector lay, until his half-brother came; and, on his arrival, the sick man, with his left hand, was to take his visitor by the right, and not to speak until spoken to by him. In conformity with these injunctions, several friends who called to inquire for the patient were excluded, and messengers were dispatched, both to George Monro's house, and to other parts of the country where he was thought to be engaged in the

* From Traditions of the Western Highlands, in the Literary Gazette

sports of the chase. Before he could be found, seven expresses had been sent after him, and five days expired. On the intelligence that his brother desired earnestly to see him, he repaired to the place, and was received in the form prescribed by the witch—Hector, with his left hand grasping George's right, and abstaining from speaking until asked "How he did?" to which he replied, "The better that you have come to visit me," and uttered not a word more, notwithstanding his urgency to obtain an interview. The younger Monro having, in this manner, been brought fairly within the compass of the witch's spells, she that same night mustered certain of her accomplices, and, having provided spades, repaired to a spot where two lairds' lands met, and, "at ane after midnycht," digged a grave of the exact length of Hector Monro, and laid the turf of it carefully aside. They then came home, and MacIngarach gave her assistants instructions concerning the part that each was to perform in the remaining ceremonies. The object—namely, the preservation of Hector's life, and the death of George in his stead—being now openly stated, some of those present objected, that if the latter should be cut off suddenly, the hue and cry would be raised, and all their lives would be in danger. They therefore pressed the presiding witch not to make the sacrifice immediately, but to cause it to follow after such an interval as might obviate suspicion, which she accordingly engaged to accomplish, and warranted him to live till the 17th day of the ensuing April, at the least. This being arranged to the satisfaction of the persons assembled, the sick man was laid in a pair of blankets, and carried out to the place where the grave had been prepared. The party were strictly enjoined to be silent, and only MacIngarach, and Christian Neill, Hector's foster-mother, were to utter the necessary incantations. Being come to the spot, their living burden was deposited in the grave, the turf being spread above him, and held down with staves. MacIngarach stood by the side of the grave, and Neill, holding a boy, a son of one Hector Leith, by the hand, ran the breadth of nine rigs, then returned, and demanded, "Which is your choice?" Thereupon the other, in name, it is to be supposed, of the Spirit of Death, replied, "Mr Hector, I choose you to live, and your brother George to die for you." This form of conjuration was thrice gone through that night; and, on its completion, the sick man was lifted, carried home—not one of the company uttering a word farther—and replaced in bed.

To the efficacy of this singular spell was attributed not only the recovery of Hector, but the death of George Monro, though the latter continued in perfect health, not only for the time warranted by the witch, but for a year longer. He was taken ill in April 1590, and died on the 3d of June following. MacIngarach was highly favoured by the gentleman, who supposed he owed to her his life. As soon as his health was restored, "be the dewilisch moyan foirsaid," he carried her to the house of his uncle at Kildrummody, where she was entertained with as much obsequious attention as if she had been his spouse, and obtained such pre-eminence in the country, that no one durst offend her, though her ostensible character was only that of keeper of his sheep. Upon the information of Lady Fowlis, the protector of MacIngarach was compelled to present her at Aberdeen, where she was examined before the king, and produced the stones out of which she had made the baron drink. These enchanted cups were delivered to the keeping of the Justice Clerk; but we are not informed as to the fate of the witch herself.

The most curious point of this trial is the opinion which it shows to have prevailed, that disease could not be expelled except by being transferred to some other living being. We have already seen the same opinion exemplified in the case of Archbishop Adamson, whose malady was indeed removed, but not entirely baffled, having been allowed to cut off a white pony as his substitute. A similar belief is entertained by the inhabitants of King George's Sound, among whom, as Mr Nind, who assisted to form the colony in that part of Australia, informs us, "If a man is ill, and imagines he shall not recover, he attempts to kill somebody, and fancies by so doing that he shall get well again." We may consider as a branch of the same superstition a receipt for removing warts, now only jocularly recommended, which is, to tie up in a bag as many small stones as there are excrescences to be got rid of, and to throw it out upon the highway; when the warts will disappear from the skin of the person who cast away the bag, and grow upon that of him who chances to pick it up.

While we read the details of these trials for witchcraft, we are not so much surprised that people should be found ignorant and wicked enough to engage in such practices, as that their efficacy should have been so universally credited. It has been alleged that the prosecutions were instituted rather with a view to protect the people from the impositions of pretended sorcerers, than from a belief that the power of enchantment was actually exercised, and required to be checked. But there can be no doubt that those who put the law in force were under the influence of the same superstition which held sway over the mass of their countrymen. Here we have a baron who had the power of trying witches, and who was yet himself the dupe of their practices; and the terms in which he was arraigned show that those who presided in the highest criminal court in the kingdom were not more enlightened in this respect. The indictment charges the prisoner that "ye gat your health be the devilisch means foirsaid." And further it says, "ye are indicted for art and part of the cruel, shameful, and odious slaughter of the said George Monro, your brother, by the enchantments and witchcrafts used upon you and by your device, by speaking to him within your bed, taking of him by the right hand, conform to the injunctions given to you by the said Marion Ingarach, in the said month of January 1588 years; *throw the which inchantmentis he tuke ane deidlie seiknes in the moneth of Apryle* 1590 *yeiris, and continew-and thairin until Junii thairefter deceissit in the said moneth of Junii, being the thrid day of that instant.*" Nothing can more plainly declare the opinion that the death of the younger brother was accomplished by the efficacy of charms, for not only is his illness here described as being produced by them, but as being produced by them though at an interval of a year and three months after their performance.

LIFE OF MAHOMET.

(Concluded.)

THE Mahometan era, called the HEJIRA, takes its commencement from the date of Mahomet's flight from Mecca to Medina. The generality of writers place this epoch on Friday the 16th of July, A.D. 622. It is this event which has rendered Friday the solemn day of the week for his followers; this choice also agreeing with the customs of the Arabians, who held their assemblies usually on the Fridays. The word *Hejira* is derived from the Arabic verb *Hajara, to abandon one's native country, to emigrate on account of persecution;* which comes from the Hebrew HAGAR, *the stranger* or *emigrant*, the name of Ishmael's mother.

It was from this period that Mahomet, having fully ascertained the hate of his enemies and the extent of his own power, proceeded to lay aside the arts of persuasion and patient endurance, whereby he had hitherto sought to propagate his tenets; and, elated by the devotion of his disciples, and his reception at Medina, he framed, henceforth, the revelations of the Korân, in a tone which proclaimed him a persecutor, and empowered his followers to make war against all opposers. The successful battle of Beder followed soon after; and he then made known those doctrines which have rendered the arms of the Mussulmans so formidable, namely, "that no one can escape his destiny; inasmuch as the man whose days are not complete will escape unhurt from a shower of arrows, when he whose fatal term has arrived cannot escape death by any precaution whatsoever." The second incitative is that which the present occasion furnished him with:—"The sword," exclaimed the Prophet, "is the key of heaven and of hell; *a drop of blood shed in the cause of God, a night spent under arms*, is of more avail than two months of fasting and prayer. Whosoever falls in battle, his sins are forgiven: at the day of judgment, his wounds shall be resplendent as vermilion, and odoriferous as musk; the loss of his limbs shall be replaced by the wings of angels and of cherubim."

This victory, the first of Mahomet's battles, was gained, in the second year of the Hejira, over the idolatrous Meccans, headed by Abu Sofiân, in the valley of Beder, which is situate near the sea between Mecca and Medina. Mahomet's forces consisted of no more than 319 men, but the enemy's army of near 1000; notwithstanding which odds, he put them to flight, having killed seventy of the principal Koreish, and taken as many prisoners, with the loss of only fourteen of his own men. This first victory, although it may seem no very considerable action, was yet of great advantage to him, and the foundation of all his future power and success; for which reason, it is very famous in Mahometan history, and is frequently vaunted of in the Korân, as an effect of the divine assistance, through the miraculous interposition of the angel Gabriel. The gaining of the battle was, however, wholly attributable to the extraordinary stratagem of Mahomet, by his expedient, at the critical moment, of scattering a handful of dust against his enemies, at the same time exclaiming, "Let their faces be confounded!"—which action so invigorated his fainting followers, that they charged and overthrew their foes. Mahomet captured the whole caravan, which consisted of 1000 camels, richly laden, from Syria; and this afforded him the means of rewarding his followers, and inciting them to further exertion by the allurements of wealth and the hope of plunder.

Some reckon no less than twenty-seven expeditions wherein Mahomet was personally present, in nine of which he gave battle, besides several other expeditions, undertaken by his orders, in which he was not present. His forces he maintained partly by the contributions of his followers for this purpose, which he called by the name of *zacât*, or alms, and the paying of which he very artfully made one main article of his religion; and partly by ordering a fifth part of the plunder to be brought into the public treasury for that purpose, in which matter he likewise pretended to act by the divine direction.

The year after the battle of Beder, being the third of the Hejira, the Koreish, to revenge the loss which they had sustained, got together an army of 3000 men, among whom were 200 horse, and 700 armed with coats of mail. These forces marched under the conduct of Abu Sofiân, who burned with desire to avenge on Mahomet the shame of his former defeat. To animate his soldiers, he took along with him his wife and a great many other women, bearing timbrels, according to the manner of the Arabians; and they accompanied the sound of these musical instruments with their voices, singing to the memory of those who had been slain at the battle of Beder. Abu Sofiân, with his forces, sat down at Dhulholeifa, a village about six miles from Medina. Mahomet, being much inferior to his enemies in number, at first determined to keep himself within the town, and receive them there; but afterwards the advice of some of his companions prevailing, he marched out against them at the head of 1000 men, of whom 100 were armed with coats of mail; but he had no more than one horse, besides his own, in his whole army. With these forces he formed a camp in a village near Ohod, a mountain about four miles to the north of Medina, which mountain he contrived to have behind him; and, the better to secure his men from being surrounded, he placed fifty archers in the rear, with strict orders not to quit their post. When they came to engage, Mahomet had the better at first; but afterwards, by the fault of his archers, who left their ranks for the sake of the plunder, and suffered the enemy's horse to encompass the Mahometans, and attack them in the rear, he lost the day, and was very near losing his life, being struck down by a shower of stones, and wounded in the face with two arrows, on pulling out of which his two foreteeth dropped out. Of the Infidels, twenty-two men were slain, and of the Moslems, seventy; and among them Hamza, the uncle of Mahomet: he was a brave soldier, and was slain by an Abyssinian slave, while stripping the standard-bearer of the Infidels, and another of their chiefs, whom he had just cut down.

Such was the unfortunate battle of Ohod, which, if the leader of the Infidels had followed up to advantage, as he ought to have done, it would almost have ruined Mahomet's cause; but, instead of this, Abu Sofiân concluded a truce with him for the following year, which gave him opportunity for retrieving his affairs. To excuse the ill success of this battle, and to raise the drooping courage of his followers, Mahomet earnestly employs himself in the latter part of the third chapter of the Korân.

In a few years, by the success of his arms (notwithstanding he sometimes, as at Ohod, came off with the worst), he considerably raised his credit and power. In the sixth year of the Hejira, he set out with 1400 men to visit the temple of Mecca, not with any intention of committing hostilities, but in a peaceable manner. However, when he came to Al Hodeibiya, which is situated partly within and partly without the sacred territory, the Koreish sent to let him know that they would not permit him to enter Mecca, unless he forced his way; whereupon he called his troops about him, and they all took a solemn oath of fealty or homage to him, and he resolved to attack the city; but those of Mecca sending Arwa Ebn Masud, prince of the tribe of Thakif, as their ambassador, to desire peace, a truce was concluded between them for ten years, by which any person was allowed to enter into league either with Mahomet, or with the Koreish, as he thought fit.

Having at length subdued the chief part of the Pagan tribes, and by his relentless severity exterminated the Jewish classes who dwelt peaceably in Arabia, in the seventh year of the Hejira, A.D. 628, he assumed the state of a sovereign, and sent embassies to the neighbouring monarchs, exhorting them to embrace Islamism, which is the name by which he called his religion.

In the eighth year of the Hejira, a quarrel, real or feigned, gave him the opportunity of possessing himself of Mecca, and of the sacred square edifice called the Caaba. Mahomet appearing suddenly at their gates with 10,000 men, before the troops of Mecca had even been apprised of his departure from Medina, they had no choice left but an immediate surrender, or destruction. Thus pressed, and menaced with instant death, the Koreish submitted to the superior ascendant of Mahomet. Their final submission to his power, and their acceptance of his faith, were ratified subsequently on the hill El Safa. Having visited the holy building of the Caaba, and broken in pieces the idols wherewith it was encircled, Mahomet went in procession seven times round the building, and touched respectfully the black stone which was held sacred by the Arabs; then, entering the edifice, he repeated the formulary, "*God is great*," and addressed his prayer. Afterwards he went to the well Zemzem—which is believed by them to be the same that the angel showed to Hager—drank of the water, and performed the required ablution. Artfully blending attention to exterior observances with zeal, and pursuing a mixed system of mercy and rigour, he subdued the hearts of his high-minded countrymen, and soon superadded to his claims of power the more imposing and indissoluble bonds of superstitious reverence and awe. The capture of Mecca, and the submission of the powerful race of the Koreish, was soon followed by the conversion to Islamism of most of the remoter Pagan tribes, until all Arabia bowed the neck beneath his yoke.

Mahomet, having thus become master of all Arabia, made great preparations for the conquest of Syria; but this vast enterprise was reserved for his successors. He gradually, however, paved the way for their successes, and brought the celebrated region of Arabia

into one complete and powerful union. He established the law which still obtains in all the Mussulman states, of imposing a personal tax on such subjects as do not embrace Islamism. By this custom, still subsisting among all the sovereigns who acknowledge the Korân, every reputed infidel pays a *kharaj*, or capitation tax, over and above the imposts, which he supports equally with the rest of the subjects. He absolutely prohibited all idolaters from making the pilgrimage to Mecca, or any foreigner from entering the Caaba, under pain of death. These were strokes of profound policy. He retained the pilgrimage to Mecca, which had been of ancient standing among the descendants of Abraham and Ishmael. Though he destroyed the images used at Mecca as objects of idolatrous worship, he carefully retained the holy relics of the black stone, and the impression of Abraham's foot. The black stone had been immemorially venerated there; the angels, it was said, had brought it *white* to the Caaba, and the sins of mankind had transformed it to *black*. Hence, in allusion to this stone, the Orientals use the compliments, "May God whiten thy face," "May the Shah make thy face white," &c.

These practices no less forwarded the progress of Islamism than did the sword of Mahomet. Every where the petty Arabian tribes overthrew their idols, and submitted themselves to the new faith. Thus was Mahometism established, and idolatry rooted out, even in Mahomet's lifetime, throughout all Arabia; and the Arabs, being then united in one faith and under one prince, found themselves in a condition for making those conquests which extended the Mahometan faith over so great a part of the world.

In the tenth year of the Hejira, A.D. 631, Mahomet set forth on a solemn and pompous embassy to Mecca, accompanied by all his wives, and by at least 90,000 pilgrims. He sacrificed with his own hands sixty-three victims, and liberated sixty-three slaves, in thanksgiving for each year of his life; he shaved his head, and scattered the hair amongst the multitude, who eagerly seized portions of it as sacred relics. He closed the solemnity with the following apostrophe, which, as if pronounced from heaven, concludes the Korân:—"Henceforth, wretched and miserable shall they be who deny your religion. Fear not them, but fear me: this day I have perfected your religion, and completed my grace toward you. I have willed that Islamism be your religion."* He established the lunar moveable year, still in use with the Mahometans; and, finally, as supreme Pontiff or Imâm, dismissed the people with a farewell, the last, as he declared, that he should give them; whence this pilgrimage derived its name of the Farewell.

Mahomet now drew near the close of his extraordinary and fortunate career. His health had been for three years on the decline; but he had neither relaxed his duties nor his labours. Tainaf, a Jewess, appears to have been the instrument to work this great event; a retributive retaliation which he had richly merited by the base and savage cruelty with which he persecuted the Jewish race, scattered peacefully amid the plains of Arabia, their refuge and resort. He had early sought to allure them to adopt his tenets; but finding them inflexibly bound to their law, he sought their destruction. The poisoned mutton which he tasted in the castle of Khaibar, although he instantly spat forth the tainted morsel, imparted its fatal influence to the vitals of the Prophet, and laid the foundation of his mortal malady, and of three years' protracted sufferings. Of this disease, the last stage was a bilious fever, which lasted for fourteen days. At times it deprived him of the use of his reason; but as Mahomet kept up the claims of his mission throughout the visitation of sickness and declining health, which he had experienced for three years previously, so did he maintain the imposition through the more trying and appalling period of his approaching dissolution.

He went regularly to the mosque to public prayers during his illness, except the last three days; then he directed that Abubeker should officiate as Imâm, and recite the prayers to the people.

At his express desire, he was removed to the dwelling of Ayesha, his favourite wife. To his companions he still described the visits of the angel Gabriel as continued to him; asserting, as his especial prerogative, that the Angel of Death was not permitted to take his soul, until he had respectfully solicited his permission. That request was granted, and Mahomet instantly fell into the agony of dissolution; his head was reclined on the lap of Ayesha; he fainted with the violence of his pain. Recovering a little from his exhaustion, and raising his eyes to the roof of the house, with a steadfast look, but faultering voice, he uttered the last broken but articulate words, "O God, pardon my sins! Ah, my companion, I attend thee to the realms above;" and peacefully expired on the floor.

He died in the eleventh year of the Hejira, A.D. 632, in the sixty-fourth year of his age. Medina became sanctified by his death, and his tomb; and the Mussulman pilgrims to the holy city of Mecca turn aside with deep devotion to honour the simple burial-place of their prophet and teacher.

Thus lived, and thus died, the most extraordinary and consummate impostor that ever appeared on the stage of the world; who acted his part throughout uniformly and consistently, from first to last, steady to his principles. The time of his appearance was particularly suited for the introduction of new doctrines; and the state of the country, and the public feeling, were peculiarly favourable for their propagation. Arabia could not have subsisted any long time as she was circumstanced at the period of his appearance; and, therefore, the success of his stupendous imposture is the more to be deplored, as, without such a baneful interposition, it may be clearly apprehended that the benign light of Christianity would have at length worked that regenerative change, which, by divine power, might have fixed the east in the true worship of God.

* The Koran, chap. v., verse 4.

ORIGIN OF ENGLISH COINS.

POUND.

THOUGH a pound is one of the most common denominations for money, it never was a *real coin*, either in gold or silver, in any age or country. Such large and ponderous coins would have been in many respects inconvenient. But for many ages, both in Britain and in other countries, that number of smaller coins which was denominated a pound in *computation*, or a pound in *sale*, really contained a *pound of silver*, and they might have been, and *frequently were weighed*, as well as numbered, to ascertain their value. If the number of coins that were denominated a *pound* in *sale*, did not actually make a pound in *weight*, an additional number of coins were thrown in to make up the weight.

MONEY

Was coined in the Temple of Juno *Moneta*, whence our English word *money*.

COIN.

Coin (*cuna pecunia*) seems to come from the French coign, *i. e. angulus*, a corner; whence it has been held that the ancientest sort of coin was square with corners, and not round as it now is.

CASH.

Cash in a commercial style signifies the ready money which a merchant or other person has at his present disposal, and is so called from French term *caisse*, *i. e.* "chest or coffer," for the keeping of money.

GUINEA.

This coin took its denomination *Guinea*, because the gold whereof the first was struck, was brought from that part of Africa so called; for which reason it likewise, formerly, bore the impression of an elephant.

The value or rate of the guinea has varied. It was first struck on the footing of 20s.; but, by the scarcity of gold, was afterwards advanced to 21s. 6d., and again sunk to 21s.

ANGEL.

The angel, called in French *angelot*, was a gold coin, value ten shillings, struck in England, where some few are still to be seen in the cabinets of the curious. It had its name from the figure of an angel represented on it, which figure was adopted, according to Rapin and others, to commemorate a pun of Pope Gregory the Great, which seems to have greatly flattered the vanity of the nation. Struck with the fair complexions and blooming countenances of some Anglo-Saxon captives who had been brought to Rome, he inquired of what nation they were, and what they were called, and being answered *Angles*: "Justly be they so called," quoth he, "for they have *angel*-like faces, and seem meet to be made co-heirs with the angels in heaven."

SHILLING.

The etymology of the word *scylling* would lead us to suppose it to have been a certain quantity of uncoined silver; for whether we derive it from Icelan, to divide, or Iceale, a scale, the idea presented to us by either word is the same, that is, so much silver cut off, as in China, and weighing so much.

There were none coined until 1504. Fabian mentions them under their proper names, 34 Henry the Eighth.

A TESTER.

Tester is derived from the French word *tête*, a head; a piece of money stamped with a head, which in old French was called "*un testion*," and which was about the value of an old English sixpence. Tester is used by Shakspeare.

Tester, sixpence, from *teston*, French, an old silver coin formerly worth 12d., sinking by degrees to gilt brass, and sixpence.

GROAT.

Other nations, as the Dutch, Polanders, Saxons, Bohemians, French, &c., have likewise their *groats*, *grots*, *groches*, *gros*, &c. In the Saxon times, no silver coin bigger than a penny was struck in England, nor after the Conquest, until Edward the Third, who, about the year 1351, coined *grosses*, *i. e.* groats, or *great pieces*, which went for 4d., and so the matter stood till the reign of Henry the Eighth, who, in 1504, first coined shillings.

PENNY—HALFPENNY—FARTHING.

Camden derives the word penny from the Latin *pecunia*, "money."

The ancient English *penny*, *penig*, or *pening*, was the first silver coin struck in England; nay, and the only one current among our Saxon ancestors; as is agreed by Camden, Spelman, Dr Hicks, &c.

The penny was equal in weight to our three pence; five of them made one shilling, or scilling, Saxon; thirty, a mark, or mancuse, equal to our 7s. 6d.

Until the time of King Edward the First, the penny was struck with a cross so deeply indented in it, that it might be easily broke, and parted, on occasion, into two parts, thence called *half-pennies*; or into four, thence called *fourthings*, or *farthings*. But that prince coined it without indenture: in lieu of which, he first struck round halfpence and farthings.

He also reduced the weight of the penny to a standard; ordering that it should weigh 32 grains of wheat, taken out of the middle of the ear. This penny was called the *penny sterling*. Twenty of these pence were to weigh an ounce; whence the penny became a weight, as well as a coin.

The penny sterling is now used less as a coin, and subsists chiefly as a money of account, containing the 12th part of a shilling, or the 240th part of a pound. —*From "Notes of a Bookworm."*

BLACK HOLE OF CALCUTTA.

THE horrible catastrophe with which the name of this dungeon will for ever be associated, together with the details of the sufferings of the wretched victims, must now be so familiar to the minds of most of our readers, that our recurring to it here may probably at first appear only a needless repetition of a "thrice-told tale." Like many other remarkable historical occurrences, however, we believe few are acquainted with the public transactions of the period in which it occurred, the position in which our possessions in the East then stood, or the particular incidents which more immediately led to the tragedy itself.

Notwithstanding the unrivalled state of prosperity to which the Bengal establishment has now attained, it was the last settlement formed by our adventurous countrymen in the eastern part of the Indian dominions, and was long held secondary, in point of commercial importance, to Madras, and the more southern settlements along the coast of Coromandel, lying within that long extent of territory known by the name of the Carnatic. It was not until the year 1656 that the merchants of Surat obtained leave from the Nabob of Bengal to erect a factory at Hoogley, on the river of that name, considerably above the site of the more recent establishment of Calcutta. It was here, however, that the English first attempted to establish political and military power in India. Upon a detail of various wrongs sustained from the native rulers being transmitted home by the factors, the East India Company sent out, in 1686, a formidable expedition (the first warlike demonstrations by the British against the Indian authorities), the object of which was no less than to levy war against the Great Mogul and the Nabob of Bengal, and this only thirty years after the Company had first obtained a footing in their territories! The result of this rash and ill-advised step was, that our countrymen speedily lost every shadow of their previous power or importance in every part of India, and were only permitted, after the most humble submission, to retain their settlement in the island of Bombay. These disputes, however, were afterwards amicably settled, and the Company were allowed to re-establish themselves, and resume their traffic, as before, at Hoogley; nor did they again experience any serious annoyance, until the commencement of hostilities between England and France, in the year 1744. When this happened, one of the first and chief points against which the French directed their efforts, with the view of crippling Britain, were our Indian settlements—Pondicherry, on the coast of Coromandel, being as yet the only station of any importance which they themselves possessed. It would be entirely out of place here to detail the continued struggle for the ascendancy in the East, which ensued between the rival nations; contending, however, less by open force of arms than secret intrigue with the native rulers, who alternately inclined to the one party or the other, as seemed best for their interests and convenience. Suffice it to say, that, early in 1761, the French were finally expelled by the British arms from all that quarter of India, by the fall of Pondicherry, which surrendered to Colonel Coote. For some years previous to this event, the British establishment at Calcutta had been advancing in prosperity with rapid strides, under the friendly aid of Aliverdi Khan, an Afghan chief of great talent, who had wrested the vice-royalty (or nabobship) of Bengal from its legitimate ruler, a weak and impotent prince. Upon Aliverdi's death, however, he was succeeded by his grandson, Surajah Dowlah (or, as sometimes spelled, Sura-jud-Dowla), a dissolute and tyrannical prince, who, stimulated by the exaggerated reports of the great wealth amassed in the factory, seized the first plausible opportunity for coming to a rupture with the settlers, and commencing hostilities. The pretext laid hold of for putting his designs in

execution, was the erection of various fortifications, which were then in progress, for the defence of Calcutta, in case of any attack being made on it by the French, but which Surajah Dowlah chose to construe into preparations against himself. He immediately collected his army, marched against that place, plundering the English factory of Cossimbuzar by the way, and making the governor and members of Council prisoners. The garrison of Calcutta at that time did not muster above 514 men, of whom only 174 were Europeans, totally undisciplined; and attempts were therefore at first made to come to reasonable terms with the Nabob, but the fate of Cossimbuzar dispelled all hopes of a peaceful accommodation. The attack on Calcutta commenced on the 18th June 1756; and, on the same day, the whole of the outworks and external fortifications fell into the hands of the Indians. Though all hope of a successful resistance was now gone, it was agreed in a council of war to hold out till the following night, in order to get time to convey the women and children on board of ship, which was safely accomplished the same night. At day-break next day, the attack was renewed, and while the situation of the besieged became every hour distressing, they had the mortification to see all the English, as well as neutral vessels, then lying in the Hoogley, weigh anchor, and proceed down the river. To complete the wretched dilemma of the troops, Drake, the governor, was seized with a panic, threw himself into the last remaining boat, and left them to their fate! Mr Holwell was chosen to fill his place, who endeavoured to open negotiations for surrender; but the troops, in the confusion, having gained access to the liquor, were soon in a state of complete intoxication, and the enemy learning how matters stood, stepped into the fort without resistance.

Of the harrowing event which took place in the fort on the night succeeding its capture, the following narrative, which originally appeared in a native East India publication, is at once the most correct and striking that has yet been given to the world:—

"At five o'clock, the Nabob entered the fort, accompanied by his general, Meer Jaffier, and most of the principal officers of his army. He immediately proceeded to the principal apartment of the factory, where he sat in state, and received the compliments of his court and attendants, in magnificent expressions of his prowess and good fortune. Soon after, he sent for Mr Holwell, to whom he expressed much resentment at the presumption of the English in daring to defend the fort, and much dissatisfaction at the smallness of the sum found in the treasury, which did not exceed 50,000 rupees. Mr Holwell had two other conferences with him on this subject before seven o'clock, when the Nabob dismissed him with repeated assurances, on the word of a soldier, that he should suffer no harm.

Mr Holwell, returning to his unfortunate companions, found them assembled and surrounded by a strong guard: several buildings on the north and south sides of the fort were already in flames, which approached with so thick a smoke on either hand, that the prisoners imagined their enemies had caused this conflagration in order to suffocate them between the two fires. On each side of the eastern gate of the fort, extended a range of chambers, adjoining to the curtain, and before the chambers, a veranda, or open gallery: it was of arched masonry, and intended to shelter the soldiers from the sun and rain, but, being low, almost totally obstructed the chambers behind from the light and *air*; and whilst some of the guard were looking in other parts of the factory for proper places to confine the prisoners during the night, the rest ordered them to assemble in ranks under the veranda, on the right hand of the gateway, where they remained for some time, with so little suspicion of their impending fate, that they laughed among themselves at the seeming oddity of this disposition, and amused themselves with conjecturing what they should next be ordered to do. About eight o'clock, those who had been sent to examine the rooms reported that they had found none fit for the purpose; on which the principal officer commanded the prisoners to go into one of the rooms which stood behind them, along the veranda. It was the dungeon of the garrison, who used to call it *The Black Hole*. Many of the prisoners, knowing the place, began to expostulate, upon which the officer ordered his men to cut down those who hesitated—on which the prisoners obeyed; but before all were within, the room was so thronged that the last entered with difficulty: the guard immediately closed the door, and locked it fast, confining 146 persons in a room not 20 feet square, with only two small windows, and those obstructed by the veranda. It was the hottest season of the year, and the night uncommonly sultry, even at this season. The excessive pressure of their bodies against one another, and the intolerable heat which prevailed as soon as the door was shut, convinced the prisoners that it was impossible to live through the night in this horrible confinement, and violent attempts were immediately made to force the door, but without effect, for it opened inwards, on which many began to give loose to rage. Mr Holwell, who placed himself at one of the windows, exhorted them to remain composed both in body and mind, as the only means of surviving the night, and his remonstrances produced a short interval of quiet, during which he applied to an old *jemautdar*, who had some marks of humanity about him, promising to give him a thousand rupees in the morning if he would separate the prisoners into two chambers. The old man went to try, but, returning in a few minutes, said it was impossible; when Mr Holwell offered him a larger sum, on which he retired once more, and returned with the fatal sentence, that no relief could be expected, because "*the Nabob was asleep, and no one dared to wake him.*" In the meantime, every minute had increased their sufferings. The first effect of their confinement was a continued sweat, which soon produced intolerable thirst, succeeded by excruciating pains in the chest, with difficulty of breathing little short of suffocation. Various means were tried to obtain more room and air. Every one stripped off his clothes, every hat was put in motion; and these methods affording no relief, it was proposed that they all should sit down on their hams at the same time, and, after remaining a little while in this posture, rise altogether. This fatal expedient was thrice repeated before they had been confined an hour, and every time, several, unable to raise themselves up again, fell, and were trampled to death by their companions. Attempts were again made to force the door, which, failing as before, redoubled their rage; but, the thirst increasing, nothing but *water! water!* became soon after the general cry. The good *jemautdar* immediately ordered some skins of water to be brought to the windows; but instead of relief, his benevolence became a more dreadful cause of destruction, for the sight of the water threw every one into such excessive agitations and ravings, that, unable to resist this violent impulse of nature, none could wait to be regularly served, but each man battled with the utmost ferocity against those who were likely to get before him; and in these conflicts many were either pressed to death by the efforts of others, or suffocated by their own. This scene, instead of exciting compassion in the guard without, only awakened their mirth, and they held up lights to the bars, in order to have the diabolical satisfaction of seeing the deplorable contention of the sufferers within, who, finding it impossible to get any water whilst it was thus furiously disputed, at length suffered those who were nearest the windows to convey it in their hats to those behind them. It proved no relief either to their thirst or other sufferings, for the fever increased every moment with increasing depravity of the air of the dungeon, which had been so often respired, and was saturated with the hot and deleterious effluvia of putrifying bodies, of which the stench was little less than mortal.

Before midnight, all who were alive, and had not partaken of the air of the windows, were either in lethargic stupefaction, or raving with delirium. Every kind of invective and abuse was uttered, in hope of provoking the guard to put an end to their miseries by firing into the dungeon; and whilst some were blaspheming their Creator with frantic execrations of torment in despair, Heaven was implored by others with wild and incoherent prayers, until the weaker, exhausted by these agitations, at length lay down quietly, and expired on the bodies of their dead and agonizing friends. Those who still survived in the inward part of the dungeon, finding that the water had afforded them no relief, made a last effort to obtain air, by endeavouring to scramble over the heads of those who stood between them and the windows, where the utmost strength of every one was employed for two hours, either in maintaining his own ground, or endeavouring to get that of which others were in possession. All regards of compassion and affection were lost, and no one would recede or give way for the relief of another. Faintness sometimes gave short pauses of quiet, but the first motion of any one renewed the struggle through all, under which ever and anon some one sunk to rise no more. At two o'clock, not more than fifty remained alive; but even this number was too many to partake of the saving air, the contest for which, and life, continued until the moon, long implored, began to break, and, with the hope of relief, gave the survivors a view of the dead. The survivors then at the window, seeing that their entreaties could not prevail on the guard to open the door, it occurred to Mr Cook, the secretary to the Council, that Mr Holwell, if alive, might have more influence to obtain their relief; and two of the company undertaking the search, discovered him, having still some signs of life: but when they brought him near the window, every one refused to quit his place, excepting Captain Mills, who, with rare generosity, offered to resign his, on which the rest likewise agreed to make room. He had scarcely begun to recover his senses, before an officer, sent by the Nabob, came, and inquired if the English chief survived; and soon after, the same man returned with an order to open the prison. The dead were so thronged, and the survivors had so little strength remaining, that they were employed for near half an hour in removing the bodies which lay against the door, before they could clear a passage to get out one by one; when, of one hundred and forty-six who went in, no more than *twenty-three* came out alive, the ghastliest forms that ever were seen on the earth. The Nabob's troops beheld them, and the havoc of death from which they had escaped, with perfect indifference, but did not prevent them from removing to a distance; and were immediately obliged, by the intolerable stench, to clear the dungeon, whilst others dug a ditch on the outside of the fort, into which all the dead bodies were promiscuously thrown."

STAGE-COACH TRAVELLING.

It is difficult to determine the exact period at which a stage-coach first appeared upon the road, but it seems to be pretty well ascertained that in 1662 there were but six, and one of the wise men of those days, John Crossell, of the Charter-House, tried his best to write them down. It was supposed he had the countenance of the country gentlemen, who were afraid, if their wives could get easily and cheaply conveyed to London, they might not settle so well afterwards to their domestic duties at the Hall or the Grange. But to go back only 90 years. In 1742, the Oxford stage-coach left London at seven o'clock in the morning, and reached Uxbridge at mid-day. It arrived at High Wycomb at five in the evening, where it rested for the night, and proceeded at the same rate for the seat of learning on the morrow. Here, then, were ten hours consumed each day in travelling twenty-seven miles, and nearly two days in performing what is now done with the greatest ease under six hours. Well-born coachmen prevail on the road. A gentleman connected with the first families in Wales, and whose father long represented his native county in Parliament, horsed and drove one side of the ground (between London and Brighton) with Mr Stevenson (who had been a Cambridge University graduate); and Mr Charles Jones, brother of Sir Thomas Tyrwhit Jones, has now a coach on the Brighton road, called the Pearl, which he both horses and drives himself. The late Mr Stevenson mentioned above (for he no longer exists) became a coachman by profession; and it is only justice to his memory to admit, that though cut off in the flower of his youth, he had arrived at perfection in his art. His education and early habits, however, had not been lost upon him; his demeanour was always that of a gentleman; and it may be fairly said of him, that he introduced the phenomenon of refinement into a stage-coach. At a certain change of horses on the road, a silver sandwich-box was handed to his passengers by his servant, accompanied by the offer of a glass of sherry to such as were inclined.—*Quarterly Review.*

PASSAGE OF MUSKET BULLETS THROUGH THE HUMAN BODY.

A number of curious cases of the progress of musket balls from the place where they were first lodged, have been observed by military surgeons. We have heard of a very remarkable case, where the musket ball struck the forehead above the nose, and having divided into two halves, one half went round beneath the skin, on the right side, and the other on the left, advancing in contact with the skull. We do not ask our readers to believe the poetical edition of this fact, that the two half bullets met again behind, after having performed the circuit of the head in opposite directions, and, advancing with a slightly diminished force, united, and killed an unfortunate man who stood in their way; but the fact of the splitting of the bullet, and the advance of each half in opposite directions, is unquestionable. The singular progress of a musket bullet from the forehead to the throat has been recorded by Dr Fielding. At the first battle of Newbury, in the time of the civil wars, a medical gentleman was shot near the right eye. The skull was fractured at the place; but though the surgeon could see the pulsation of the brain beneath the wound, yet the bullet had turned to one side, and could not be discovered. Various bones were discharged from the wound, the mouth, and the nostrils. At the time of the second battle of Newbury, the wound healed, and could not be kept open; but about twelve years afterwards, when the doctor was riding in a cold dark night, he felt a pain on the left side of his head, about the "almonds of the ear," which occasioned a partial deafness. Having stopped his ear with wool, he was surprised one day, in March 1670, by a sudden puff or crack in his ear, when all that side of his cheek hung loose, as if it had been paralytic, and a hard knot was felt under the ear. Various tumours now appeared about the throat, and in August 1672, the bullet was taken out of the throat, near the *pomum Adami.*—*Fraser's Magazine.*

CLIMATE OF ENGLAND.

The mortality of Great Britain, its cities, and its hospitals, is greatly inferior to that of any other country in Europe; it is also incontestible that "Great Britain is at present the most healthy country with which we are acquainted;" and that it has been gradually tending to that point for the last 50 years. This superior value of life in Great Britain is not confined to any particular districts or classes of individuals. To whatever point we turn our view, the advantage is still the same; the man of affluence, the pauper-patient of the hospital, the sailor and the soldier on active service, the prisoner of war, the inmate of a jail, all enjoy a better tenure of existence from this country than from any other of which we have been able to consult the records. It has been long the fashion, both abroad and at home, to exhaust every variety of reproach on the climate of our country, and particularly on the atmosphere of London; and yet we shall find that the most famed spots in Europe, the places which have long been selected as the resort of invalids, and the fountains of health, are far more fatal to life than even this great metropolis. The annual proportion of deaths at Montpelier was greater 30 years ago, and is greater at present, than in London.—*Dr Hawkins' Elements of Medical Statistics.*

Column for Young People.

You may remember that a long while ago I gave you a very pleasant article on Bees, extracted, specially for your own reading, from a nice little book called "Art in Nature," written by a person named Charles Williams, and published in London by Frederick Westley and A. H. Davis. I am now going to give you another of Mr Williams's papers, and a very capital paper it is for you to read, on the subject of Spiders. I know that many of you think that Spiders are very nasty little insects, because they crawl about the walls, and spin their ugly webs in the corners of the rooms; but you have no idea what funny creatures Spiders are, and what strange things they do; so now I am going to let you know some remarkable circumstances connected with their mode of living, and their pursuits. Here the article begins:—

"It was a September morning, and the aspect of nature was autumnal. The foliage of the trees had begun to change their hue; and, while the orchards yielded their last fruits, which might grace the dessert of a peer, the hedges were filled with their humble produce, and clusters of privet, elder-berries, and buckthorn, vied with one another. These, however, were relieved by the hips, honeysuckles, and viburnum, which put forth their scarlet balls; and the beautiful fruit of the woody nightshade, wild-service, and mountain-ash, delighted the eye, and soothed the spirits depressed by the anticipation of winter.

Of this Mr Elwood felt conscious, when, returning from an early call on a friend, he saw his youngest child Edward—a fine boy of four years old, whose clustering locks, bright eyes, and rosy cheeks, made him a model of infant beauty—blowing soap bubbles, with many a clapping of hands, and merry bound, and hearty laugh, as he saw them rise, glitter, and at length burst in the air. Amused at the sight, he gazed for some time; when, calling Emma and Frederick, he told them to watch the process, and that the first balloons ever made were produced in a similar way. This led to many inquiries, and to the remark, that what has been done only of late years, after many efforts, by man, to rise into the air, has been accomplished, from the earliest times, by the gossamer spider.

'O, papa!' said Emma, on hearing this, 'I wish you would tell us all about them. Now, I think you will!—and here, dear mamma, let me place your chair next to papa's, and you can remember something;—and I will listen so attentively, and Frederick will—won't you, dear? And then, mamma, and then—I'll play my new rondo as well as ever I can.'

Mr E. Happily, my dear, I have leisure to gratify you. Dr Lister noticed the falling of these webs, and in them discovered more than once a spider, which he named the *bird*. On one occasion, whilst he was watching a common spider, it suddenly turned on its back, darted forth a long thread, and, vaulting from the place where it was, was carried upwards to a great height. He further discovered, that, while spiders fly in this manner, they pull in their long thread with their fore-feet, so as to form it into a ball—or, as it may be called, air-balloon—of flake. So high did they ascend, that one day in autumn, when the air was full of webs, he went to the top of the highest steeple of York Minster, from whence he could see the floating webs still far above him. He took some of the spiders that fell and were entangled on the pinnacles. They were of a kind that never enter houses, and, therefore, could not be supposed to have taken their flight from the steeple. Of one insect he observed, he says, 'Certainly this is an excellent rope-dancer, and is wonderfully delighted in darting its threads; nor is it only carried in the air like others, but it effects itself its ascent and sailing; for by means of its legs, closely applied to each other, it as it were balances itself, and promotes and directs its course no otherwise than as if nature had furnished it with wings or oars.'

F. Has any other person particularly noticed them?

Mr E. Mr White has done so. 'Every day in fine weather in autumn,' he says, 'do I see these spiders shooting out their webs and mounting aloft; they will go off from the finger if you will take them into your hand. Last summer one alighted on my book as I was reading in the parlour; and, running to the top of the page, and shooting out a web, took its departure from thence. But what I most wondered at was, that it went off with considerable velocity in a place where no air was stirring; and I am sure that I did not assist it with my breath. So that these little crawlers move faster than the air in the air itself.'

E. Are they often to be seen, papa?

Mr E. Yes, sometimes in great numbers. I will give you Mr White's account of a shower of these webs. On the 21st of September 1741, intent upon field diversions, he rose before day-break; but, on going out, found the whole face of the country covered with a thick coat of cobweb drenched with dew. When his dogs attempted to hunt, their eyes were so blinded that they were obliged to lie down and scrape themselves. About nine o'clock, a shower of these webs, formed not of single floating threads, but of perfect flakes, some near an inch broad, and five or six long, was observed falling from very high regions, which continued through the whole of the day; and they fell with a velocity which showed that they were considerably heavier than the atmosphere. On ascending the highest parts of the country where this was observed, the webs were still seen falling, and twinkling like stars in the sun. The flakes of the web hung so thick upon the edges and trees, that baskets-full might have been collected. In Germany, these flights of gossamer appear so constantly in autumn, that they are there called 'the flying or departing summer;' and authors speak of the web as often hanging in flakes, like wool, on every hedge and bush, throughout extensive districts.

F. For what are these webs made, papa?

Mr E. As the single threads shot by other spiders are usually their bridges, this, perhaps, may be their object, and thus the spiders may be conveyed from spot to spot with less labour than if they had travelled over the ground. And as Kirby says, also, as they seem so thirsty, may not the drops of dew with which they are always as it were strung, be a secondary object with them? So great are their numbers, that sometimes every stalk of straw in the stubbles, and every clod and stone in the fallows, swarms with them. Dr Strach assures us that twenty or thirty often sit on a single straw, and that he collected about two thousand in half an hour, and could have easily doubled the number had he wished it.

E. But, papa, what makes the spiders go up, up, up, like Mr Green's balloon, which I saw at Stamford, until it looked not larger than an orange, and then went quite out of sight?

Mr E. It is probable that they do so in pursuit of food, for the rejected parts of gnats and flies are often found in the falling webs. Perhaps the flight of some particular species, forming a favourite food of the little aeronauts, may take place at these times. No doubt, however, that the end is worthy such extraordinary means. And I wish you particularly to observe, when you see this spider's thread floating in the air, and stretching from hedge to hedge across a road or brook of four or five yards wide, that this little creature has *no wings* wherewith to fly, nor muscles to enable it to spring or dart to so great a distance; and hence its Creator has laid for it this path in the atmosphere. Though the insect itself be heavier than air, the thread which it spins is lighter. This, then, is its *balloon*. Left to itself, the spider would drop to the ground; but, being tied to its thread, both are supported! This also mounts, and buoys up the insect itself, as the tail of a kite does the body. Some of them, it seems, not only bestride their film, but roll it up in a mass, and then sail in a balloon.

Mrs E. My love, the web of the gossamer spider finely illustrates Paley's doctrine of compensation. It supplies the place of wings; and the defects of one part or of one organ are often made up for by the structure of another part or of another organ. Let us try to recollect some instances. I remember, he says, that the common parrot has, in the structure of its beak, both an inconvenience and a compensation for it. By an inconvenience, he means what appears when the peculiar structure of an organ which fits it for one purpose unfits it for another. Thus the upper bill of the parrot is so much hooked, and so much overlaps the lower, that if, as in other birds, the lower part alone had motion, the bird could scarcely gape wide enough to receive its food; yet this hook and overlapping of the bill could not be spared, for by it the bird climbs: to say nothing of its use in breaking nuts and the hard substances on which it feeds. How, therefore, is the difficulty prevented? By making *both* parts of the jaw moveable. In most birds, the upper chap is connected, and makes but one piece with the skull; but, in the parrot, the upper chap is joined to the bone of the head by a strong membrane placed on each side of it, which lifts and depresses it at pleasure.

E. That's a delightful story, mamma; perhaps, while you are thinking of another, papa will tell us what he remembers.

Mr E. Birds have no teeth;—I mean such as common fowls, pigeons, ducks, geese, &c. What have they, then, to make up for this want? A most powerful muscle called a gizzard, the inner coat of which has rough plaits, which, by strong friction against one another, break and grind the hard food as effectually, and by the same sort of action, as a coffee-mill would do. Without this, it is proved that a chicken would starve upon a heap of corn! This contrivance goes no farther than the necessity. The food of birds of prey does not require to be ground in a mill, and in them a gizzard is not found. I almost forget what he says about the bat.

Mrs E. I remember it perfectly. At the angle of the bat's wing there is a bent claw, exactly in the form of a hook, by which the creature attaches itself to the sides of rocks, caves, and buildings, laying hold of crevices, joinings, chinks, and roughnesses. It hooks itself by this claw, remains suspended by this hold, and takes its flight from this position; which compensates for the shortness of its legs and feet. Without its hook, the bat would be the most helpless of all animals. It can neither run upon its feet, nor raise itself from the ground. But all this is made up for by the contrivance on the wing; and, in placing a claw on that part, the Creator has deviated from what is observable in winged animals. 'A singular defect,' says Paley, 'required a singular substitute.'

F. Cannot you give us one more such fact, papa?

Mr E. Yes, my dear, but that one must suffice The short, unbending neck of the elephant is made up for by the length and flexibility of his proboscis or trunk. He could not reach the ground without it; or, if he could have fed on the fruit, leaves, or branches of trees, how was he to drink? Should it be asked, why is the elephant's neck so short? it may be answered, that the weight of a head so heavy could not have been supported at the end of a longer lever. And then the proboscis itself is most curious. The disposition of the rings and fibres—first, to form a long pipe; secondly, to contract and shorten it; and, thirdly, to turn it in every direction at pleasure: with, moreover, a fleshy production at the end, of about the length and thickness of a finger, and performing the office of one, so as to pick up a needle or a straw—exhibits an instrument truly amazing.

E. Wonderful—wonderful—wonderful, papa!

Mr E. Yes, my love,

> 'Wonderful, indeed, are all *His* works,
> Pleasant to know, and worthiest to be all
> Had in remembrance, always with delight.'"

EFFECT OF THE NERVOUS SYSTEM ON THE INTELLECTUAL POWERS.

When Lord Sunderland was at the Hague, he contracted a particular intimacy with Mr Cunningham [author of the History of Great Britain], as they were both remarkable chess-players. Whenever his Lordship was at leisure, he either drove to Cunningham's lodgings, which were at some distance, or sent his carriage for him. After playing for a course of time, Lord Sunderland discovered that he who was jolted in the carriage before they sat down, was always sure to lose every game; for which reason he gave over going to Cunningham's, but always sent for him, and always beat him, to his no small astonishment, as he was conscious that he understood the game as well as his adversary. At last, when he was very much out of humour, Lord Sunderland told him the trick, and Cunningham insisted that they should drive to one another's lodgings alternately, which confirmed his Lordship's observation, and restored Cunningham to his former level; for, from that time, they won and lost alternately. This fact, which appears not at all incredible, for the streets of the Hague were not, in the last century, so smooth as those of London are at present, proves how nicely the capacities of Sunderland and Cunningham were balanced against each other: but it is more curious and interesting on another account—it shows the intimate connection between our corporeal frame and the faculty of thinking.—*Thomson's Introduction to his Translation of Cunningham's History of Great Britain.*

CALDERWOOD CASTLE.

The fall of this castle, which took place about sixty years ago, was attended with circumstances of so romantic a nature, that we think them deserving of record.

There was a Dr Baillie, a clergyman, father to the late Sir Matthew Baillie, physician in London, and who had been tutor to the *then* Sir William Maxwell* and his two brothers, one of whom was father to the present General Sir William Maxwell, who had a villa in that neighbourhood, and was, consequently, a frequent visitor at the castle. One day, when at dinner with his wife, he said he had all forenoon felt an anxiety about Calderwood, as if some of the family were ill. Mrs Baillie said there seemed no cause for such a supposition, and the conversation ended. At tea in the evening, Dr Baillie said, "You know, Mrs Baillie, that I am far from being superstitious; but it is strongly impressed upon my mind that some of that family is seriously ill." Mrs Baillie replied, that had that been the case, he might be sure they would have been informed of the circumstance; besides, he was down there four or five days before, when they were all in perfect health. At their supper, Dr Baillie again said, "It does not signify, Mrs Baillie; but I have taken an anxiety about that family that I can neither account for nor control, and I am certain some individual there is most seriously ill." Mrs Baillie desired him to order his horse to the door, and put his nightcap into his pocket, and ride down to the castle, though the family would be much surprised at a visit at so late an hour. Dr Baillie arrived about eleven o'clock, when the family were just going to bed. His first question was, "Is the family all well?" Lady Maxwell said, they were all well, thank God, and was glad to see the doctor, and ordered a bed-room to be prepared for him. He then explained the cause of so untimely a visit, and requested Sir William that he would order a servant, with a couple of candles, to go with him into the castle, while his bed-room was preparing, as he wished to examine the east wall, where he perceived a slight rent when he was last there, and was desirous to see if any alteration had since taken place. It may be proper to say, that all the house servants, and several of the farm servants, slept in the castle, and most of these had gone to bed. In about a quarter of an hour, Dr Baillie returned, and said he was certain the castle was going to fall, as the rent he had formerly noticed was considerably enlarged. The servants were all ordered to get out of bed, and to join the family, who resided in a more modern building, attached to the castle. At the top of the castle was a square tower, in which were deposited the archives and records of the family. These Sir William had conveyed away. The family then determined to sit up all night, and see the result; when, at half-past nine in the morning, the whole of the east side of the castle went over with a tremendous crash! There was a range of stables below the castle, full of horses; but these were saved by the stables being arched, and were dug out of the ruins two days afterwards. Thus, if it had not been for a providential interposition of Dr Baillie, nine or ten persons would have been crushed to death.

* The narrative which follows we have had the honour of receiving from a descendant of the family.

THE TURNBULLS AND RUTHERFORDS.

It is related that Sir Andrew Turnbull of Bedrule, upon Rule Water, in Roxburghshire, was so notorious a thief, that the principal gentlemen of the clans of Hume and Kerr refused to sign a bond of alliance, to which he, with the Turnbulls and Rutherfords, was a party, alleging that their proposed allies had stolen Hume of Wedderburn's cattle. The authority of Morton, however, compelled them to digest the affront. The debate, and a curious one it is, may be seen at length in *Godscroft*, vol. i. p. 221. The Rutherfords became more lawless after having been deprived of the countenance of the court, for slaying the nephew of Forman, archbishop of St Andrew's, who had attempted to carry off the heiress of Rutherford. This lady was afterwards married to James Stewart of Traquair, son to James Earl of Buchan, according to a papal bull, dated 9th November 1504. By this lady a great estate in Teviotdale fell to the family of Traquair, which was sold by James Earl of Traquair, lord high treasurer of Scotland, in consequence of the pecuniary difficulties to which he was reduced by his loyal exertions in favour of Charles the First.

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 61. SATURDAY, MARCH 30, 1833. PRICE THREE HALFPENCE.

UMBRELLAS.

THERE is one piece of property, which is nobody's property, or every body's property, or is not property at all—and that is, *Umbrellas*. "'Twas mine, 'tis his, and has been slave to thousands," was not more truly said of the circulating medium, than it might be said of this curious branch of the floating capital of the nation, which fructifies in the hands of no one, but is continually going or flying about in the hands of this person and that person, and is always getting worse and worse. Umbrellas, I must confess, are to me a puzzle. Some people, certainly, do buy them new, for there are shops in every considerable town of the realm, where they are sold. But I wonder what kind of people they can be who do so; for one might just as well buy two cube acres of the wind, in the hope of handing them down as a patrimony to one's descendants. Alas! for the instability of all earthly things, and umbrellas in particular! Who can say that he ever actually owned an umbrella? Umbrellas are things of no power of adherence to man. They make unto themselves wings, and fly away. Just suppose, for the sake of argument, that you have been so far left to yourself, one day, as, in a fit of love for your race, to buy an umbrella. Suppose, further, that from a fondness for the article, and an experience of the volatility of this species of so-called property, you have taken it to an engraver, and watched over him till he painsfully carved your name upon it, by way of fixing down its affections to you for ever. Vain endeavour! The treacherous and ungrateful fabric of silk and whalebone will walk by your side for a little while, fending you lovingly from showers and snowdrifts; but soon, alas! too soon—three weeks after marriage—you look about you, and where is it?—why, eloped right slick away with another love—a new acquaintance, fairly deserted you with your three children, and commenced a career of vagrancy over the world, which will only terminate with its being blown to shivers some day by the vengeful blast of heaven, as its last proprietor turns the corner of one of the windiest streets in the town.

Somebody once made an amusing book by imagining the adventures of a guinea, and describing the characters and fates of a number of individuals into whose hands the coin was supposed to have successively fallen. But the adventures of an umbrella would obviously be a far more richly varied and piquant composition. A friend, say, has been one day overtaken by a determined rain, while visiting you: the time has arrived when he *must go*—for he has a particular appointment—and when you, moreover, are excessively anxious that he *should go*, for you are just about to sit down to dinner, and have heard enough of your wife's intentions that forenoon, to know that a new eater, in addition to the usual number, is not desirable, either for his own sake, or theirs. Well, what can you do? Your friend manfully proposes to brave the storm, saying, as he looks out and buttons up his coat, that it is a mere skiff, and is just going off—though, for your part, you never saw a more perfect *even-down pour*, as they say in Scotland, in your life. Why, you *must* offer your umbrella. Flesh and blood will not have it otherwise. All the humanities—all commandments, human and divine, order it so. One last glance, then, at the dear object—bought at White's one little month ago—fondled and rejoiced in since, beyond all common sentiment—and away it goes, never to be seen more, leaving you with the bitter consciousness that you have been accessory, with your eyes open, to the abduction of the very object which, next to your wife, you chiefly held dear on earth.

This is the first move in the maze of confusion. Your umbrella, faithfully promised to be returned that night, does not re-appear, as, indeed, you never expected that it would, for it is not in the nature of man to return an umbrella, and there's an end on't. So, as the rain is worse than ever, and your wife will not hear of your going out "with such a cold hanging about you," without a defence against the weather, you yourself are obliged to become an abductor of other men's umbrellas in your turn, and borrow one from a neighbour. Thus, with the dismal sense upon your mind that one crime leads to another, and that you are robbing another of that which not enriches you (for of course by this time it is neither the late owner's, nor can you calculate upon it being long your own), you take off your weary way through the rain—mentally comparing, at the same time, the cottony vulgarity of the present article with the well-chosen and smart-looking convenience which yesterday was generally but erroneously supposed by mankind to be yours. The rain ceases while you are waiting in some house or shop, and you depart without your umbrella—that is to say, without the umbrella you lately carried, for to use any of the possessive pronouns respecting this fugitive article is evidently an absurdity in terms. When you get home to dinner, and recollect the loss, you send to make inquiries, but learn that the missing article was lent to somebody who called soon after you left the place, and is by this time, in all probability, through as many hands as the body of the hunchback in the Arabian Nights' Entertainments.

The labyrinthine winding through which umbrellas sometimes travel is really astonishing. Reader, had you ever one, which you had once been in the ridiculous habit of calling your own, lent to you on a great emergency, by a friend, who, on inquiry, was found to have come by it, no doubt, honestly, but from a place or person the last in the world you would have expected it to have found its way to? Such things have been, and they are but a sample of the common wonders that enter into the fates of umbrellas. It is a sad thing to have the very umbrella which you have been *cultivating*—the umbrella that has been carried near your heart, under your arm, for weeks—the love of your bosom, in short—ravished away from you, and sent a-spinning through the world, here and there, in a thousand directions;—but well is it with you when the case is no worse. Hard as that is, there is something harder and more heart-rending still, in your once more overtaking your umbrella in its last days, and being shocked by the ravages which time, and handling, and perhaps the mender, have wrought upon the once delicate constitution of your early flame. *There* is a misery—there *is* a true agony of agonies. What struggles have you then to endure between old attachment—a sentiment that will not be suppressed—and the natural loathing you cannot at the same time help feeling for the tawdry and squalid aspect of the object, with the sense you have of the wretched hands through which it must have come, since it was, as you thought, *yours!* If any one entertains a real hatred for a man, he could wish him few worse wishes than that he might buy and cultivate an umbrella, and then, after long years, fall in with it again, when it had been fully drabbed, and drudged, and draggled through a thousand turns of good and evil fortune.

A great deal of the vagrancy of umbrellas is owing to their being so frequently exchanged at public places by what is called mistake; that is to say, a gentleman takes some other person's umbrella out of the *trap*, as it is too pertinently termed, instead of his own, which he leaves behind. There is one most notable phenomenon attending these mistakes, namely, that no one ever mistakes a *worse* umbrella for his own. People, in these cases, seem to act unconsciously and instinctively upon the great commercial maxim, that it is needless to make a barter without some advantage. Let you get your umbrella twice exchanged in this manner, and you will find yourself to have sunk from an affair of five and twenty shillings, down to a blue, brass-ringed dowdy, which, ten years ago, cost three and sixpence. Three removes, indeed, are as bad as a fire in this case. The worst thing about such an exchange, effected against your will, is the having to protect yourself homewards through the rain with such a wretched rag as generally falls into your hands. In fact, the whole phenomenon affords a lively illustration of the natural succession of an age of inferior metal to that which went before it: you begin with gold, and you end with brass.

Mankind are divided into two great classes in reference to umbrellas—one which buys umbrellas, and one which does not. There is no difference between the two as to the amount of their wealth in umbrellas: you are just as sure to find an umbrella in the lobby of the one as in the lobby of the other. It is impossible, however, to deny, that the man who actually buys an umbrella is a man of a most patriotic and benevolent disposition—one who suffers in the behalf of mankind at large, and is therefore entitled to the thanks of his fellow-creatures. The *sic vos non vobis* is most truly applicable in their case; even the unfortunate generation of bees is hardly more disinterested. I would therefore propose, that, whenever a man dies, who, it can be ascertained, has spent any part of his fortune in this manner, his survivors ought at the very least to testify their gratitude by erecting a mausoleum, with a top in the shape of an umbrella, over his grave; by which peculiarity the emblem would be conspicuously distinguished from all other monuments, so that in walking through a churchyard, posterity might know when a mere poet or philosopher was referred to, and when the great inhabitant below was one who had (Oh thrice greater fame!) signalized himself by purchasing an umbrella.

LONDON THOROUGHFARES.

LONDON again.—The next thing which astonishes the provincial in his perambulations through the metropolis, is the extraordinary thoroughfare of vehicles on the streets, which is certainly fully as remarkable as the number of foot passengers. It is of no use for him to count them as they pass. There they go, of all descriptions and sizes—waggons, cars, carts, chaises, coaches, cabs, omnibuses, and drays; all tugging, struggling, and striving, as if the whole world were in motion. "Such a many," as a Cockney expresses himself, never could have been conjectured to be in existence. In other towns you may see two or three—or perhaps a dozen—vehicles on a line of street at a time, and that is reckoned pretty well—the sign of a "bustle," probably. But here you are overwhelmed in the *melée*. Conceive a line of street, three miles in length, thickly packed with the above variety of vehicles, one behind another, in two rows, the one proceeding the one way, and the other the other, and that from morning till night—no intermission. Sometimes it is no easy matter for a foot passenger to get as much empty space as will allow him to cross; and when he does so, he takes good care to calculate the exact time

he will take to make the passage, lest he be ridden down. Yet few accidents occur on the streets of London; for the inhabitants are very expert in crossing, and do not allow themselves to be discomposed by the racket which is almost incessantly going on.

The system of carriage in London has a fine air of barbarous romance about it. For most kinds of heavy goods, particularly coal, huge cumbersome waggons on four broad wheels are used. These are drawn by four, or five, or, as frequently, six horses, yoked in pairs, and all heavy sluggish animals, which move along at a slow dignified pace, as if conscious of performing in some great and glorious pageant. These solemn and sombre-coloured animals are excellent feeders, and go through a great deal of work in that way. As for the service they perform in return, it may be estimated that a couple of Scotch horses and carts would execute fully as much labour; but then a single horse in a light two-wheeled cart has no show—no waggoner would descend so far as to drive it; it would not embody the splendid idea of a team; and so, it is worthy of all contempt. Nothing like the good old clumsy machinery of our Saxon ancestors. Great improvements have been lately effected in London in the transport of passengers. The old hackney coaches and their horses are dying out, being evidently pushed out of existence by quite a novel kind of conveyances. *Cabs* and omnibuses are now nearly all in all with most people, though, for our part, we still like to encourage a hack, which, being usually the cast-off equipage of some nobleman, is not only of superior construction and convenience, but serves to furnish matter for moralizing on the frolics of fortune, and the vicissitudes that may take place even in the existence of coaches. The cabs, which came first in upon the line of business of the hacks, are neither more nor less than one-horse gigs on two wheels, with a flexible covering for bad weather. The driver sits on a little seat on the outside, above the wheel. The word *cab* is a contraction of *cabriolet*, that being too long and much too expensive a word for a Londoner to use, seeing that time is so valuable in the metropolis. These cabs go helter-skelter in all directions; driving like furies through thick and thin; darting out of the line of march when they find an opening; splitting a hair on the axles of the waggons; and delivering their fare at every given point within the bills of mortality, at a moderate price. Omnibuses are an entirely different species of conveyance. They are got up on principles of the purest modern expediency, and are therefore very characteristic of the age. An omnibus —we wonder the word is not already subjected to contraction—is a long wooden box, on springs and four wheels, having a long seat on each side within. The door is behind, with hanging steps always ready for entrance; while the driver sits in front, and the door-opener stands behind. Two horses draw this vehicle, which can contain twelve or fourteen persons. Omnibuses act as stage-coaches from one part of the town to another. At present, they will convey you three miles, or any lesser distance, for sixpence; but they are continually stopping to let passengers in and out, wherefore, though to many very convenient, they are much less rapid than hacks or cabs, and are by no means the most agreeable conveyances to men unreasonably fastidious. The omnibuses seem all to radiate from "the Bank"—that is, the Bank of England, which is situated in the heart of the city—and are obviously the result of the extension of the town, which cannot now be conveniently traversed on foot. They therefore help to thin the crowds of passengers on the pavements, and facilitate business; but it is alleged they are doing much harm to the respectable and ancient trade of the mendicant, which is now hardly worth the pursuing, and that they have considerably diminished the revenue of the sweepers of the crossings. An appeal to the legislature is talked of, and possibly Mr Cobbett may take up the question.

As you walk along any of the great thoroughfares of London, you continually ask yourself, Do the people here know any thing of each other? do they care for one another when sick? is there such a thing as private friendship amongst them? or are they all, all so ardent and so much occupied in the pursuit of money, that they shut out the whole human race from their sympathies, and live and die only for themselves? Such inquiries will force themselves on the mind of the stranger, whose feelings are of a warm and unsophisticated character. But your real Londoner would not comprehend such a species of sentiment. He would consider it all stuff. London is not what it appears. Its population is not an inextricable mass, in which there is no regular bond of affection. It is composed of an endless series of circles of friendship and acquaintance, proceeding from Whitechapel on the east, to St James's on the west. The people of London are not one people any more than their city is one town. Every street and its precincts form a little world, and every neighbourhood is known to itself. The inhabitants of the Minories do not very closely resemble those within the atmosphere of "the Parks;" perhaps on jubilee occasions the former may penetrate as far westward; and there have been instances of "west-enders" going on a tour of discovery into the strange countries within the precincts of Wapping; but in general each district contents itself with looking after its own affairs, and trusting to the newspapers for accounts of the "rare doings" in distant quarters of the capital.

There are many good-natured souls in the country who are in the habit of imagining, that, when any great political movement is taking place at the seat of government, all London, as a matter of course, is on the alert—that the people are standing in clusters on the streets, shaking their heads most significantly at each other—that, in the language of the newspapers, "business is at a stand"—in short, that every thing betokens a regular break-up in the state. Now, all such suppositions are unjustified by fact. Except on rare occasions, every thing just goes on as usual. It should always be borne in mind, that, what with attending to business, and attending to the process of eating and drinking, the people have no time to spare for "all that kind of thing." And what a glorious characteristic of John Bull is this! What a security it is against all rebellion, conspiracy, and revolution, that the Englishman *must have his dinner*, and that dinner, too, in all its plenitude of material, and time for consumption! There is nothing to compare with it in the system of any other nation; and, alas! how insecure, therefore, are their different governments! When any thing unusual takes place at Paris, the volatile Parisian puts three raisins into his pocket, shoulders his musket, and fights for three days, without ever thinking for another moment about the comfort of his inner man. But this is out of the question with the Londoner. *He* must regularly go to shop at nine in the morning, and as regularly to dinner at a certain hour in the afternoon; and no revolution in the government could derange him so much as a revolution in these particulars of his own steady life. Perhaps, if a great state change could be effected between ten in the morning and three in the afternoon, it *might be* done. But if once a dinner hour intervened—why, the whole scheme would be broken up; every man would go away to his roast beef or boiled mutton; and the enemies of our liberties would, before tea-time, have us all once more snugly under thraldom, beyond the possibility of even a new *attempt* at emancipation.

POPULAR INFORMATION ON HISTORY.

THE EMPIRE OF CONSTANTINOPLE, TO THE TAKING OF THAT CITY BY THE TURKS.

When Constantine, as has been already noticed, removed the seat of government from Rome to his new city of Constantinople, his sway extended from Britain to the river Euphrates, and from the Danube to the deserts of Africa. These dominions, however, hung very loosely together; for, as different parts of the army had at various times raised their own commanders to the empire, there was no successful or favourite general who might not aspire rather to be independent in his own province, or to usurp the supreme dominions. This caused frequent rebellions in the provinces. Constantine himself, however, after defeating several other candidates, reigned undisturbed for twenty-five years, and, during the leisure of a powerful reign, introduced a more regular system of general government, which tended to strengthen the dependence of the numerous provinces upon the sovereign. He was the first of the Roman emperors who adopted the Christian religion, and who directly favoured its disciples; but he allowed the heathens, who were still by far the most numerous people, the full exercise of their various modes of worship. His three sons divided the empire among them in equal portions (A. D. 336); but by the death or assassination of the other two, the whole soon fell into the hands of Constantius, who adopted as his colleague and successor his relation Julian, a young man of fantastic character, but of considerable talents. Julian succeeded to the sovereignty in 360; and having imbibed at Athens, where he resided some time, an admiration for the old Grecian philosophers (who had professed the heathen religion as that of their country, though they were aware of its follies), he imagined that he could not be a philosopher except he were also a heathen; so that he abjured Christianity, and made himself ridiculous by performing immense sacrifices of cattle to the heathen gods. He was a capricious and whimsical prince, but not unjust, or unsuccessful in war. He maintained the empire in its full extent, and was killed in a successful invasion of Persia. He was succeeded, after the fall of several candidates, by Valentinian, whose father had been a soldier from the Danube. This emperor took for colleague his brother Valens, to whom he assigned Constantinople, and the government of the East. The reign of Valens was signalized by the irruption into Europe of an enemy till then unknown to the Romans; these were the *Huns*, a confederation of Tartar tribes, some of whom had attained the ascendancy and control over the rest, and led them on to invade the nations of Europe. Their numbers and ferocity lead the ancient writers to describe them in terms of consternation, which to moderns, who are no strangers to Calmucks, Cossacks, Tartars, and other savages from that quarter, appear sufficiently ludicrous. They never lived in houses, slept under trees, ate raw flesh, and were altogether superior in war even to the Goths, who were now in alliance with the Romans, and had begun to relish the comforts of a settled life. They were, therefore, driven away before the Huns, and were forced, in search of a home, to invade the Roman territory. Here they were opposed by the Emperor Valens, but they defeated his army, and made his own life a sacrifice. He was succeeded by his nephew Gratian, who chose for his colleague Theodosius, a general of talents and celebrity. This emperor restored the confidence of his own army, and broke the power of the Goths, by his skill and caution, and was the first of the emperors who practised the mode of dividing the barbarians against one another, by giving money to such of their tribes as he imagined would make useful auxiliaries. This system, which the wealth of the emperors (from their possession of all the maritime and trading cities) enabled them long to use against their poorer enemies, often saved the empire at the expense of its dignity; for though the money was given at first as a gratuity, it was sometimes demanded in times of weakness as a tribute. This Theodosius (commonly called the Great) was the first who made Christianity the established religion of the empire (390). He procured a senatorial edict in favour of the Christians, sanctioned the destruction of the heathen temples, and forbade the performance of sacrifices either in public or private. The empire under this prince still preserved its original extent, but he divided it between his two sons, Arcadius and Honorius (394), and its parts were never afterwards reunited.

From the death of Theodosius the Second (449) to the reign of Justinian (527), the Eastern Empire continued without any considerable alteration, though there were many changes and intrigues in the court and army. The reign of the latter prince is memorable on several accounts; it was under his auspices that a knowledge of the silk manufacture was first brought to Europe, where it gave employment to much ingenious industry (900). Justinian also caused certain eminent lawyers to prepare a code of laws, and an abridgement of law decisions, &c., called the Pandects, which were used by all his successors, and have been adopted as the basis of their laws by several countries of Europe. The talents and virtues of his general, Belisarius, regained to the empire Africa, and great part of Italy, from the Vandals and Ostrogoths; this conquest, however, only prevented the latter region from being united under one government, and has been the cause of its remaining a feeble and divided country ever since. In the reign of Tiberius, shortly after (580), the people of Rome, though they entreated with great earnestness the aid and pity of the emperor, who now claimed to rule over them, were unable to obtain any relief, and remained distracted between their attachment to the ancient head of the empire, and the claims of his enemies who occupied the rest of Italy.

The next emperor who merits attention is Heraclius (610), a native of Africa. The Eastern Empire had till now preserved its ancient boundaries in their full extent, and was mistress of Carthage, Egypt, Syria, and Asia Minor, besides Greece, and the countries on the Danube. The Roman armies on the eastern frontier had, however, been lately driven in by Chosroes, King of Persia, who now occupied all the north of Africa and Syria. This was the first great violation of their territory sustained by the emperors of Constantinople: and Heraclius avenged it with a celerity and effect which made the Persians tremble. He pursued Chosroes into his own territory, and forced him to hide himself one night in a wigwam, where he was obliged to creep into the door on his hands and feet. It is said that the government of the Persians was disagreeable to the provinces, which (though often oppressively taxed) had always been accustomed, under the Romans, to a regular form of laws, and that, therefore, they returned with willingness under the power of Heraclius (628). His triumph, however, was short, for the latter part of his reign was disturbed by the rise and victories of Mahomet. The successors of this signal impostor, after breaking the power of Persia (already weakened by the victories of Heraclius), immediately attacked the Roman empire; then defeated its armies in two battles, occupied all Syria, and obliged the emperor (now an old man) to retire to Constantinople. He died in 641.

The continued victories of the followers of Maho-

met (called Arabs or Saracens) soon deprived the empire of Egypt, Africa, and Syria; and in 668 they followed up their success by attacking Constantinople itself. The city sustained two sieges, in the first of which the Saracens were encamped in its neighbourhood, and carried on the operations of a siege at intervals, for seven years; and in the second, for nearly two. In both they were repulsed, partly by the strength of the fortifications, but more effectually by means of what has been called the *Greek fire*. This was a composition of sulphur, pitch, and rock-oil, which, whenever it was kindled, burnt without quenching, even in water: it was darted upon the besiegers and their works, by arrows wrapped in tow, and dipped in the liquid, or was discharged upon them in torrents from some kind of tubes. In both sieges the Saracens wasted immense resources ineffectually.

The empire had now lost all its provinces eastward of Mount Taurus, and the cities of Alexandria, Jerusalem, and Antioch, were in the hands of the Mahomedans. There was little further change in its condition till the year 867, under the Emperor Basil, who gave new vigour both to the internal administration and to the military resources of the government. This prince, and his immediate predecessor Zimisces, made the Roman arms—for they still wished to be called Romans—respected on the Euphrates and Tigris, and asserted the ancient warlike reputation and boundaries of the empire. They were now, however, deprived of the resources they had enjoyed in the secure possession of the great commercial cities of the Mediterranean—Alexandria, Carthage, Cæsarea, &c.; and the trade and revenues of those which remained were crippled and diminished from the want of that free general intercourse which had existed when they were all under one government. Hence the armies were maintained with greater difficulty, and any victories that were gained could not be followed up with effect. The early enemies of the empire—the Goths, Vandals, and Huns—had now settled into civilized communities, and were no longer formidable. The foes with whom it contended latterly were the Bulgarians and Seljukian Turks; the former of whom were rather troublesome than dangerous, but the latter, who had succeeded the Saracens in the dominion of Asia, aimed at nothing short of the destruction of the Roman name. They succeeded at last, by defeating and taking prisoner the Emperor Romanus Diogenes, in tearing away almost the whole province of Asia Minor (1099); and the emperors were now confined to their dominions in Europe, which, however, still formed a monarchy not much smaller than France or Spain.

The manners of the court of Constantinople during much of this period were dissolute and corrupt. We are told of one emperor who ordered a plate of human noses to be brought to his table; another was accustomed to seize the deputies of cities whose tribute was in arrear, and suspend them with their heads downwards over a slow fire; a third got up farces in mockery of the ceremonies of religion: and, in general, the appointment of officers, and even the succession to the empire (where it was not seized by some successful general) was in the hands of the women and eunuchs of the palace. The cities and provinces generally acquiesced as to the choice of an emperor, in the decision of the capital or army; this circumstance shows that the laws were attended to, and that there was a regular system of government, which was not much disturbed by the personal character of the reigning prince. The countries of Greece, however, which had formerly been the seat of knowledge and the arts, were now sunk in ignorance; and the little learning that was cultivated in the capital was only scholastic divinity, or the pedantry of law and grammar. There is no scholar or philosopher of the empire of Constantinople who is generally known to posterity; and those who have written its annals in modern times, complain that its contemporary historians are partial, full of prolixity on unimportant matters, and barren of useful information.

A great change took place in the relations of the empire after the eleventh century. It was still pressed by the Turks on the east, who now occupied Asia Minor, and were only separated from Constantinople by the Hellespont; while, in Europe, its territories were disturbed by the incursions of certain Norman adventurers who had settled in Sicily; against these enemies the emperor Claudius Comnenus, an active prince, and full of resources, made all the resistance which his diminished revenues allowed, and applied to the Christian sovereigns of Europe to aid him in expelling the Mahomedans from the territories of the empire, but above all, to drive out the Turks from the land of Judea, which they occupied and profaned, and where they harassed the Christian pilgrims who desired to visit the scenes of Scripture history. This appeal of the emperor was received in Europe at a time when men's minds had been already stirred by vivid representations of the cruelties of the Mahomedans in the Holy Land; and the consequence was, that many of the princes and chiefs of Christendom, with vast multitudes of their people, resolved to combine in an endeavour to assist the emperor, and free Judea from the infidels. This expedition took place in 1099, and is known as the *first crusade*, or expedition of the cross. It is reckoned that 300,000 men arrived at Constantinople, besides multitudes who died on the road; and the emperor was alarmed at the fierce army of strangers pouring into his dominions, over whom or their chiefs he had no control. He hurried their passage over the Bosphorus into Asia as quickly as possible, so that the commanders were hardly pleased with their reception, and repaid the distrust of the emperor with insolence and dislike. They were victorious, however, after many calamities, over the Mahomedans, and gained possession of Jerusalem, leaving to the emperor their conquests in Asia Minor, which, from the vast numbers destroyed in the crusade, they had no means of retaining in their own hands (1118).

There were six other expeditions of a similar kind, though of less magnitude than the first: the last was in the year 1248, and during the whole of the intervening period, Constantinople became a great thoroughfare for the passage of the Christian princes, and of their followers, to the east. The commerce, which originated partly in the wants of these military pilgrims, and partly in the ancient wealth of that celebrated capital, induced great numbers of the merchants and people of the west to settle there. The original jealousy between these strangers and the rulers of Constantinople still subsisted, and was now embittered by certain religious disputes between the Latin (or western) and Greek churches. This source of disquiet was heightened by dissensions among the members of the reigning family, in which the western or Latin strangers (consisting chiefly of French and Italians) interfered: they at last took such a decided part as to lay siege to Constantinople, and to place the candidate (Alexius Angelus), whom they favoured, upon the throne (1203). The Greeks, however, refused to submit to the indignity of seeing their empire given away by foreigners (whom they still called barbarians), and, rising in tumultuary rage upon the insolent Latins, they drove them from the capital. These enemies, however, immediately returned—formed the siege a second time, and, being again successful, they plundered the imperial city without mercy, and destroyed with fierce havoc those splendid monuments of art or expense which form the ornaments of an ancient capital (1204). They proclaimed Baldwin, count of Flanders, emperor, but gave him only a fourth part of the dominions of the empire, the French and Italian chiefs dividing the rest among themselves. There were five emperors of the Latin race, who enjoyed a troubled possession of Constantinople for about 60 years.

The Greek sovereignty was in the meantime established at Nice, in Asia Minor, where it attained considerable power as a minor state; while the feudal tyranny of the military adventurers who reigned in Constantinople, made their yoke intolerable to the people. The Greek rulers, therefore, who brought back with them the old laws of the empire, were soon able to re-establish themselves in their capital (1261), and to regain a considerable portion of their dominions in Macedonia, Greece, and the Islands. The Turks under Othman and his successors, who had gained the ascendancy in Asia Minor, were their chief enemies after this re-establishment; and as that people gradually rose to power, the emperors were obliged to seek the alliance of other nations to counterbalance their hostility. By a policy of this kind, they at one time had the assistance of the Moguls (under Timour); and at others, leaned for support on the Pope, and the western nations of Europe; and the empire thus subsisted as a secondary state, and without vigour, for about two centuries after the expulsion of the Latins. It had now no influence on other nations, and was altogether changed and shrunken from the character of that power which had first given celebrity to Constantinople.

The Turks, who were settled at Bursa, in Asia Minor, were continually making encroachments on its territory, and had long possessed themselves of Adrianople, in Europe. The capital of the empire, therefore, lay between two of the chief strongholds of its enemies, and was exposed at every opportunity to their hostilities. Had the government of the petty emperors (as they must now be called) not been supported by the attachment of their subjects, and by considerable policy, they could not have existed many years in this situation, especially as there was often much intrigue and dissension in Constantinople itself. It was not till the year 1453 that the city was at last taken, after a severe siege by the Turks under Mahomet the Second; and the pageant of the Roman empire in the east was then finally dissolved. The victors succeeded immediately to those portions of the empire which had remained attached to the capital; and, after some years, wrested also from the Venetians and Genoese those territories which had been detached at the time of the Latin usurpation.

Thus, at the middle of the fifteenth century, the last vestige of the Roman power was destroyed, the Lower empire, or that of Constantinople, having survived, in however impaired a condition, about a thousand years after Rome had been intruded upon by the barbarians, or until 2185 years from the foundation of the Roman monarchy. It is somewhat remarkable that the fate of Rome and Constantinople was strictly analogous. Rome became the seat of a bishop, who, under the appellation of the Pope, acquired a sway over the greater part of the Christian world; while Constantinople was constituted the place of residence of a Turkish sultan, who claimed a descent from Mahomet, and, as a spiritual chief, wielded an equally influential authority over the whole of the Mahomedan nations in the east. The power of both these successors of the emperors remains till the present day, but sadly mutilated and contemned, and the present aspect of affairs seems to betoken its speedy and final dissolution.

A TALE OF SCOTTISH LIFE.

NATURE has made woman weak, that she might receive with gratitude the protection of man. Yet how often is this appointment perverted! How often does her protector become her oppressor! Even custom seems leagued against her. Born with the tenderest feelings, her whole life is commonly a struggle to suppress them. Placed in the most favourable circumstances, her choice is confined to a few objects; and, unless where singularly fortunate, her fondest partialities are only a modification of gratitude. She may reject, but cannot invite; may tell what would make her wretched, but dare not even whisper what would make her happy; and, in a word, exercises merely a negative upon the most important event of her life. Man has leisure to look around him, and may marry at any age, with almost equal advantage; but women must improve the fleeting moment, and determine quickly, at the hazard of determining rashly. The spring-time of her beauty will not last; its wane will be the signal for the flight of her lovers; and if the present opportunity is neglected, she may be left to experience the only species of misfortune for which the world evinces no sympathy. How cruel then, to increase the misery of her natural dependence! How ungenerous to add treachery to strength, and deceive or disappoint those whose highest ambition is our favour, and whose only safety is our honesty!

William Arbuthnot was born in a remote county of Scotland, where his father rented a few acres of land, which his own industry had reclaimed from the greatest wildness to a state of considerable fertility. Having given, even in his first attempts at learning, those indications of a retentive memory, which the partiality of a parent easily construes into a proof of genius, he was early destined for the Scottish church, and regarded as a philosopher before he had emerged from the nursery. While his father pleased himself with the prospect of seeing his name associated with the future greatness of his son, his mother, whose ambition took a narrower range, thought she could die contented if she should see him seated in the pulpit of his native church; and, perhaps from a pardonable piece of vanity, speculated as frequently upon the impression his appearance would leave upon the hearts of the neighbouring daughters, as his discourses upon the minds of matrons and mothers. This practice, so common among the poorer classes in Scotland, of making one of their children a scholar, to the prejudice, as is alleged, of the rest, has been often remarked, and sometimes severely censured. But probably the objections that have been urged against it derive their chief force from the exaggerations upon which they are commonly founded. It is not in general true that parents, by bestowing the rudiments of a liberal education upon one of the family, materially injure the condition or prospects of the rest. For it must be remembered, that the plebeian student is soon left to trust to his own exertions for support, and like the monitor of a Lancasterian seminary, unites the characters of pupil and master, and teaches, and is taught by turns.

But to proceed with our little narrative:—The parish schoolmaster having intimated to the parents of his pupil, that the period was at hand when he should be sent to prosecute his studies at the university, the usual preparations were made for his journey, and his departure fixed for the following day, when he was to proceed to Edinburgh under escort of the village carrier and his black dog Cæsar, two of the oldest and most intimate of his acquaintances. The feelings of affectionate regret, occasioned by his separation with his parents, were most seasonably suspended by the receipt of a letter from Mr Coventry, a respectable farmer in the neighbourhood, in which that gentleman offered to engage their son for a few years, as a companion and tutor to his children. This was an offer which his parents were too prudent to reject, particularly as it might prove the means of future patronage, as well as of present emolument. It was therefore immediately agreed upon that William should himself be the bearer of their letter of acceptance, and proceed forthwith to his new residence.

On the afternoon of the same day, he arrived at Daisybank, where he was welcomed with the greatest cordiality. His appearance was genteel and prepossessing, and it was not long before his new friends discovered, that the slight degree of awkwardness which at first clung to his manners, proceeded more from bashfulness and embarrassment, than natural rusticity. But as he began to feel himself at home, this embarrassment of manner gradually gave place to an easy but unobtrusive politeness. Indeed, it would not have been easy for a youth of similar views, at his first *outset* in life, to have fallen into more desirable company. Mr and Mrs Coventry were proverbial among their neighbours for the simplicity and purity of their manners, and they had laboured, not unsuccessfully, to stamp a similar character upon the minds of their children. Their family consisted of two sons and two daughters, the former of whom were confided to the care of William.

Mary, the eldest of the four, now in her sixteenth or seventeenth year, was in every respect the most

interesting object at Daisybank. To a mind highly cultivated for her years, she united many of those personal graces and attractions which command little homage in the crowd, but open upon us in the shade of retirement, and lend to the domestic circle its most irresistible charms.

It will easily be believed that it was next to impossible for a youth nearly of the same age, and not dissimilar in his dispositions, to remain long insensible to beauties that were gradually maturing before his eyes, and becoming every day more remarkable. Fortunately, however, the idea of dependence attached to his situation, and a temper naturally diffident, determined him to renounce for ever a hope which he feared, in his present circumstances, would be deemed ungrateful and even presumptuous. But this was waging war with nature, a task which he soon found to be above his strength. He had now, therefore, to abandon the hope of victory for the safety of retreat, and content himself with concealing those sentiments he found it impossible to subdue. Yet so deceitful is love, that even this modest hope was followed with disappointment. One fine evening in June, when he was about to unbend from the duties of the day, and retire to muse upon the amiable Mary, he encountered the fair wanderer herself, who was probably returning from a similar excursion. He accosted her in evident confusion, and, without being conscious of what he said, invited her to join him in a walk to a neighbouring height. His request was complied with in the same spirit it had been made, for embarrassment is often contagious, particularly the embarrassment arising from love. On this occasion he intended to summon up all his powers of conversation, and yet his companion had never found him so silent. Some common-place compliments to the beauty of the evening were almost the only observations which escaped his lips, and these he uttered more in the manner of a sleep-walker than a lover. They soon reached the limit of their walk, and rested upon an eminence that commanded the prospect of an extensive valley below. Day was fast declining to that point which is termed twilight, when the whole irrational creation prepare for rest, and only man dares to intrude upon the silence of nature. Miss Coventry beheld the approach of night with some uneasiness, and dreading to be seen with William alone, she began to rally him upon his apparent absence and confusion, and proposed that they should immediately return to the house. At mention of this, William started as from a dream, and being unable longer to command his feelings, he candidly confessed to her the cause of his absence and dejection. He dwelt with much emotion upon his own demerit, and voluntarily accused himself for the presumption of a hope which he never meant to have revealed until the nearer accomplishment of his views had rendered it less imprudent and romantic. He declared that he would sooner submit to any hardship than incur the displeasure of her excellent parents, and entreated, that whatever were her sentiments with regard to the suit he was so presumptuous as to prefer, that she might assist him in concealing from them a circumstance which he feared would be attended with that consequence. To this tender and affectionate appeal the gentle Mary could only answer with her sighs and blushes. She often indeed attempted to speak, but the words as often died upon her lips, and they had nearly reached home before she could even whisper an answer to the reiterated questions of her lover. But she did answer at last; and never was a monarch more proud of his conquest, or the homage of tributary princes, than William was of the simple fealty of the heart of Mary.

It will readily be imagined that the saddest day of our tutor's life was that on which he parted from this amiable family. He had here, he believed, spent the happiest moments of his existence, and, instead of rejoicing that he had passed through one stage of his apprenticeship, he dwelt upon the past with pleasure, and looked forward to the future with pain.

Fortune, however, presented an insuperable obstacle to his spending his days in the inaction of private study; and he knew that he could neither gain, nor deserved to gain, the object of his affection, without establishing himself in life, by pursuing the course which had been originally chalked out to him. After, therefore, "pledging oft to meet again," he bade adieu to Daisybank, loaded with the blessings of the best of parents, and followed with the prayers of the best of daughters. He now paid a farewell visit to his father and mother, and after remaining with them a few days, proceeded to Edinburgh, and, for a short period, felt his melancholy relieved by the thousand novelties that attract the notice of a stranger in a great city. He soon distinguished himself in his classes, and, before the usual period, was engaged as a tutor in one of the best families in Scotland.

This event formed another important era in his life. His prospects were now flattering, and as vanity did not fail to exaggerate them, he soon dropped a considerable portion of his humility, and began to regard himself as a young man of merit, to whom fortune was lavish of her favours. In his leisure hours he had opportunities of mingling much in society; and as his manners and address were easy and engaging, scarcely a week elapsed that did not add to the number of his friends. The affections, when divided into many channels, cannot run deep in any; and probably, for every new acquaintance whom William honoured with his esteem, it required a sacrifice of friendship at the expense of love, and produced some abatement of that devotion of soul which accompanies every true and permanent attachment. At Daisybank he had seen a simple favourite of the graces, but here he beheld the daughters of wealth and of fashion, surrounded with all the gloss of art, and soon began to waver in his attachment, and even to regard his engagement as little more than a youthful frolic. By degrees, he became less and less punctual in his correspondence with Miss Coventry, and in place of anticipating the arrival of her letters as he was wont to do, he allowed them to be sent slowly to his lodgings, opened them without anxiety, and read them without interest. Of all this inconstancy, ingratitude, and neglect, the simple Mary remained a silent though not unconcerned spectator. Kind and generous by nature, and judging of others by herself, she framed a thousand excuses for his negligence; and when he did condescend to write to her, answered him as if she had been unconscious of any abatement in his attentions.

Matters remained in this uncertain state for the space of three long years—at least they seemed long to Miss Coventry—when William received his licence as a preacher. He now, therefore, thought of redeeming a pledge he had given to the minister of his native parish, to make his first public appearance in his pulpit; and after giving due intimation, he departed for the parish of ———, with his best sermon in the pocket of his best coat. The account of his visit spread with telegraphic despatch, long before telegraphs were invented, and was known over half the district many days before his arrival. This was another great and eventful day for his mother. She blessed Providence that she had lived to see the near fulfilment of her most anxious wish, and rising a little in her ambition, thought she could now die contented, if she should see him settled in a living of his own, and be greeted by her neighbours with the envied name of grandmother. As William was expected to dine with his parents on his way to the parsonage, or, as it is called in Scotland, the manse of ———, great preparations were made for his reception, and for the appearance of the whole family at church on the following Sunday. Mrs Arbuthnot drew from the family chest her wedding gown, which had only seen the sun twice during thirty summers; and her husband, for the first time, reluctantly applied a brush to his holiday suit, which appeared, from the antiquity of its fashion, to have descended, like the garments of the Swiss, through many successive generations of the Arbuthnots.

The little church of H—— was crowded to the door, perhaps for the first time, long before the bellman had given the usual signal. Mr Coventry, though residing in a different parish, had made a journey thither with several of his family, for the purpose of witnessing the first public appearance of his friend. In this party was the amiable Mary, who took a greater interest in the event than any one, save the preacher himself, was aware of.

William on this occasion recited a well written discourse with ease and fluency, and impressed his audience with a high opinion of his talents and piety. Mr Coventry waited in the church-yard till the congregation had retired, to salute his friend, and invite him to spend a few days at Daisybank. Mary, who hung in her father's arm, curtsied, blushed, and looked down. She had no well-turned compliment to offer on the occasion, but her eyes expressed something at parting, which once would have been sweeter to his soul than the applause of all the world besides.

Ambition from the beginning has been the bane of love. War and peace are not more opposite in their nature and effects than those rival passions; and the bosom that is agitated with the cares of the one, has little relish for the gentle joys of the other. William beheld in the person of Miss Coventry all he had been taught to regard as amiable or estimable in woman; but the recollection of the respect that had been shown him by females of distinction, mixed with exaggerated notions of his own merit, made him undervalue those simple unobtrusive graces he once prized so highly, and think almost any conquest easy, after he had been settled in the rich living of B———, which had been promised him by his patron.

On the following day he paid a visit to Daisybank, and received the most cordial welcome from a family who sympathized almost equally with his parents in his prospects and advancement. During his stay there, he had frequent opportunities of seeing Miss Coventry alone, but he neglected, or rather avoided them all; and when rallied on the subject of marriage, declaimed on the pleasures of celibacy, and hinted, with a good deal of insincerity, his intention of living single.

William bade adieu to Miss Coventry without dropping one word upon which she could rear the superstructure of hope, and carried with him her peace of mind, as he had formerly carried with him her affections. From that hour she became pensive and melancholy, in spite of all her efforts to appear cheerful and happy. She had rejected many lovers for the inconstant's sake; but that gave her no concern. Her union with him had been long the favourite object of her life; and she could have patiently resigned existence now that its object was lost. But she shuddered at the thought of the shock it would give her affectionate parents; for the softer feelings of our nature are all of one family, and the tenderest wives have ever been the most dutiful daughters.

It was impossible for Mary long to conceal the sorrow which consumed her. Her fading cheeks and heavy eyes gave daily indications of what her lips refused to utter. Her parents became deeply alarmed at these symptoms of indisposition, and anxiously and unceasingly inquired into the cause of her illness; but her only answer was, that she felt no pain. The best physicians were immediately consulted upon her case, who recommended change of air and company. But all these remedies were tried without effect. The poison of disappointment had taken deep root in her heart, and defied the power of medicine.

Her attendants, when they found all their prescriptions ineffectual, began to ascribe her malady to its real cause, and hinted to her parents their apprehensions that she had been crossed in love. The good people, though greatly surprised at the suggestion, had too much prudence to treat it with indifference; and they left no means untried, consistent with a regard for the feelings of their child, to wile from her the important secret. At first, she endeavoured to evade their inquiries; but finding it impossible to allay their apprehensions without having recourse to dissimulation, she confessed to her mother her attachment to William, concealing only the promises he had made to her, and every circumstance that imputed to him the slightest degree of blame. At the same time she entreated them, with the greatest earnestness, that no use might be made of a secret which she wished to have carried with her to the grave. This was a hard task imposed upon her parents. They felt equally with herself the extreme delicacy of making the disclosure; but, on the other hand, they contemplated nothing but the probable loss of their child—an event, the bare apprehension of which filled their minds with the bitterest anguish. After many anxious consultations, Mr Coventry determined, unknown to any but his wife, to pay a visit to William, and ascertain his sentiments with regard to his daughter.

Upon his arrival at Edinburgh, he found that his friend had departed for the manse of B———, with which he had been recently presented. This event, which in other circumstances would have given him the liveliest pleasure, awakened on this occasion emotions of a contrary nature, as he feared it would make his now reverend friend more elevated in his notions, and, consequently, more averse to a union with his daughter. He did not, however, on that account, conceal the real object of his journey, or endeavour to accomplish his purpose by stratagem or deceit. He candidly disclosed his daughter's situation and sentiments, requesting of his friend that he would open to him his mind with equal candour; and added, that, although he held wealth to be an improper motive in marriage, and hoped that his daughter did not require such a recommendation, yet, in the event of a union, whatever he possessed would be liberally shared with him.

On hearing of the situation of Miss Coventry, William became penetrated with the deepest remorse; and being aware that his affection for her was rather stifled than estranged, he declared his willingness to make her his wife. These words operated like a charm upon the drooping spirits of the father, who embraced his friend with ardour, and besought him immediately to accompany him home, that they might lose no time in making a communication, which, he fondly hoped, would have a similar effect upon the spirits of his daughter.

They departed accordingly together, indulging in the pleasing hope that all would yet be well; but on their arrival at Daisybank, they were seriously alarmed to hear that Miss Coventry had been considerably worse than her father left home. She was now entirely confined to her chamber, and seemed to care for nothing so much as solitude, and an exemption from the trouble of talking. As soon as she was informed of the arrival of their visitor, she suspected he had been sent for, and, therefore, refused to see him; but upon being assured by her mother, who found deceit in this instance indispensable, that his visit was voluntary and accidental, she at last consented to give him an interview.

On entering the room which had formerly been the family parlour, William was forcibly struck with the contrast it exhibited. Every object seemed to swim before his sight, and it was some moments before he discovered Miss Coventry, who reclined on a sofa at the farther end of the room. He advanced with a beating heart, and grasped the burning hand that was extended to meet him. He pressed it to his lips, and wept, and muttered something incoherent of forgiveness and love. He looked doubtingly on Mary's face for an answer; but her eye darted no reproach, and her lips uttered no reflection. A faint blush, that at this moment overspread her cheek, seemed a token of returning health and strength, and inspired him for a moment with confidence and hope. It was the last effort of nature; and ere the blood could return to its fountain, that fountain had closed for ever. Death approached his victim under the disguise of sleep, and appeared divested of his usual pains and terrors.

William retired from this scene of unutterable anguish, and for a long period was overwhelmed with the deepest melancholy and remorse. But time gradually softened and subdued his sorrow, and, I trust, perfected his repentance. He is since married and wealthy,

and is regarded by the world as an individual eminently fortunate and happy. But amidst all his comforts, there are moments when he would exchange his identity with the meanest slave that breathes, and regards himself as the murderer of Mary Coventry.*

A BORDER PROPHECY.

Atween Craig-cross and Eildon Tree,
A bonny bairn there is to be,
That 'll neither have hands to feeht nor feet to flee,
To be born in England, brought up in Scotland, and to gang hame again to England to dee.

THIS prophecy has been popular, in a certain district of the south of Scotland, from time immemorial. It is usually ascribed to Alexander Peden, the Cameronian seer; but as that right worshipful personage succeeded to a great deal of the fame and literary property of Thomas the Rhymer, and has been more than once detected in re-predicting what his predecessor had long before foretold, it may be in reality of much higher antiquity. Be the author who he may, it is certain that the prophecy came to pass in recent times. About the middle of the last century, a boy was born without hands and feet, at a place called Ballen Mill, near Falstone, in Northumberland. His name was Paterson. Soon after his birth, he was removed to Falnash Mill, near the head of the Teviot water, about eight miles above Hawick. Here he was brought up. While yet a child, he was taken back to England with the rest of his family, and he died at Carlisle, aged seven years; thus completely fulfilling every particular of the prediction, and thereby confirming all the people who knew the circumstances in a belief of Mr Peden's prophetic powers. He was long after remembered in Carlisle, on account of his intellectual capacity, and the astonishing extent of his knowledge of the Holy Scriptures.

The subject of the prophecy had a brother, who survived him, and lived till recent years at Tarras-foot, in the parish of Cannobie. The peculiarities of this man seem to indicate that the family had oddities of more sorts than one. He was prodigiously fond of gossip, or what in Scotland is called *cracking*. Like Walter Peacock, the town-drummer of Paisley—who was such an amateur in his profession, that, when once fairly agog in a *ruff*, there was no stopping him, except by holding his hands—Paterson could not by any means but those of force be unsettled in his hobby of garrulity. He is said to have himself sometimes used force in compelling people to listen to him. A person of the name of Graham had the misfortune one summer evening to meet him on the public road near his house at Tarras-foot. After an hour or two spent in discussing the news of the day, Graham endeavoured to get away, knowing that his family at home would be alarmed at his non-appearance. Paterson, however, held him still by the button, until he had inflicted another mortal hour of gossip upon him. Graham then, in a sort of desperation, took a sudden opportunity of shaking himself loose from the unconscionable talker, and was marching off at a quick pace, when Paterson out-manœuvred him, by getting in before him, prevented his further progress, and, finally, *wiered* him, as a shepherd would say, up to a corner of the dyke, from which it was impossible he should escape. Thus he stood the whole night, bored by the garrulous old fellow, and it was actually broad day before he was permitted to go home. Another instance of Paterson's indefatigable talkativeness may be adduced. He had been in the habit of resorting to the house of a neighbour every evening during a long course of time, for the gratification of his favourite passion. [Indeed, he went far and wide for this purpose, and was as well acquainted with the topography of all the ingle-neuks in the country for ten miles round as he was with that of his own in particular.] The goodman and goodwife of this humble tenement, who had often wished him in a place we shall not name, for his late sittings, agreed one night to let him sit just as long as he would, for the sake of experiment, or, in other words, to let him rise first. Paterson sat till long past midnight with undiminished vigour, and without showing the slightest symptom of a desire to go. At length the goodman could sit no longer. He took care, however, not to disturb or scare away his visitor. Under the pretence of going out, he slipped behind the hallan, took off his clothes, and quietly went to bed. Paterson sat still, talking to the goodwife, who did not feel so much inconvenience as her husband from the infliction, having, like Baron Trenck, got a habit of answering and carrying on the conversation by monosyllables, while she slept as sound upon her chair as if she had been a-bed. At length, when the cuckoo-clock proclaimed the hour of eight, and the light peeping down the spacious chimney announced the approach of day, Paterson reluctantly got upon his legs, and took his leave, only observing, that the goodman had surely gone a-courting, seeing that he tarried so long.

* This affecting and well-told tale is from the *Dumfries Magazine* for 1825. We believe it is from the pen of Mr M'Diarmid, the editor and publisher of that able provincial print, and does great credit both to his abilities and his feelings.

EDINBURGH IN THE PRESENT AND PAST AGE.

UP till the middle of the last century, the city of Edinburgh continued to occupy little more than the space of ground which it had assumed in the reign of James the Third and Fourth, namely, the ridge of land sloping from the Castle on the west to Holyroodhouse on the east. Its external appearance was grand, and travellers invariably admired the lofty magnificence of its principal street, which is now degraded and abused. The houses were tall tenements of eight and nine storeys, entered by common stairs, with the doors of the separate dwellings on the different landing-places. This practice prevailed not only in the main street, but in the alleys, or *wynds*, which were just so many closely-packed streets. About sixty years since, this ancient and confined mode of living was greatly altered, by the erection of a New Town on an open space of ground north from the old city, and which is now the place of residence of all the higher, and the greater part of the respectable classes in the Scottish metropolis.

It may be worth while to contrast the accommodations at present required by a person of first rank in Edinburgh with what was deemed sufficient in the last age. At present, a gentleman of the best order in Edinburgh—say a judge of the Court of Session—finds it necessary to have a self-contained house in Moray Place, or some equally splendid district, for which he pays a rent of about L.160 (the very feu-duty, perhaps, costing L.35 annually), and which consists of four flats, containing the following apartments:—On the sunk floor, a complete suite of culinary apartments, with accommodation for servants; on second floor, dining-room in front, business room or library, and a bed-room, behind; on third floor, drawing-room occupying the whole front of the house, with two large apartments behind generally occupied as bed-room and dressing-room, but which may be added to the drawing-room, upon occasion, by means of large door-ways; fourth flat, a nursery and a number of good bed-rooms, besides which there is perhaps a suite of small rooms immediately under the slates. The furniture of such a house would not cost less than fifteen hundred pounds, but more generally is purchased at the rate of two thousand.

In opposition to this picture, we give the accommodation which satisfied a most respectable judge and landed gentleman of the latter part of the last century, namely, Lord Kennet.—[It was, to be sure, while still in business as an advocate—but still he was a gentleman of good estate.]—This eminent person lived in a flat in Forrester's Wynd, Lawnmarket, which he either rented, or might have rented, at about L.15, and which contained the following apartments, as described by a member of his lordship's family:—The rooms were three—the kitchen one. One room was "my lady's," another was the gentleman's consulting-room or study; the third was their bed-room. The servant girl, who, besides the nurse, was their only female attendant, slept under the dresser in the kitchen. Their single man servant slept out of the house; and the nurse and children had beds in the study, which, during the day, were removed into the bed-room! In his latter days, when raised to the bench, his lordship, by way of making a corresponding step in gentility, removed to a house of *two* flats—in the *Horse Wynd!*

The moral of this contrast, which, every body will acknowledge, might easily be extended to every rank in Scottish society, is a sufficient proof, if proof were wanting, of the prodigious advance made during the last fifty years, in all that regards domestic circumstances, in Scotland. The cry of evil times and a necessitous population is now as loud as ever; but a few statistical facts like the above are only required to prove it destitute of foundation. Men may now live as near the verge of their income as before, and may therefore feel as often the twinge arising from inadequate funds. But it is clear that the style of existence is in every respect universally improved. To hope for the day when men will be prudent enough to avoid all those little evils which evidently are the only cause of the apparent discontent, is to expect more than human nature can give.

INSTINCT OF BIRDS.

THEY who write on natural history cannot too frequently advert to instinct, that wonderful limited faculty, which, in some instances, raises the brute creation, as it were, above reason, and, in others, leaves them so far below it. Philosophers have defined instinct to be that secret influence by which every species is impelled naturally to pursue, at all times, the same way, or track, without any teaching or example; whereas reason, without instruction, would often vary, and do that by many methods which instinct effects by one alone. Now, this maxim must be taken in a qualified sense, for there are instances in which instinct does vary and conform to the circumstances of place and convenience.

It has been remarked, that every species of bird has a mode of nidification peculiar to itself, so that a schoolboy would at once pronounce on the sort of nest before him. This is the case among fields, and woods, and wilds; but in the villages round London, where mosses, and gossamer and cotton from vegetables, are hardly to be found, the nest of the chaffinch has not that elegant finished appearance, nor is it so beautifully studded with lichens, as in a more rural district; and the wren is obliged to construct its house with straws and dry grasses, which do not give it that rotundity and compactness so remarkable in the edifices of that little architect. Again, the regular nest of the house-marten is hemispheric; but where a rafter, or a joist, or a cornice, may happen to stand in the way, the nest is so contrived as to conform to the obstruction, and becomes flat, or oval, or compressed.

In the following instances, instinct is perfectly uniform and consistent. There are three creatures, the squirrel, the field-mouse, and the bird called the nut-hatch, which live much on hazel-nuts, and yet they open them each in a different way. The first, after rasping off the small end, splits the shell into two with his long fore-teeth, as a man does with his knife; the second nibbles a hole with his teeth, so regular as if drilled with a wimble, and yet so small that one would wonder how the kernel can be extracted through it; while the last picks an irregular ragged hole with its bill; but as this artist has no paws to hold the nut firm while he pierces it, like an adroit workman, he fixes it as it were in a vice, in some cleft of a tree, or in some crevice, when, standing over it, he perforates the stubborn shell. We have often placed nuts in the chink of a gate-post, where nut-hatches have been known to haunt, and have always found that those birds have readily penetrated them. While at work, they make a rapping noise that may be heard at a considerable distance.—*White's Natural History of Selborne.*

BIOGRAPHIC SKETCHES.

SAUNDERSON.

NOTHING almost appears so surprising as the intelligence and general knowledge often possessed by men who have all their lives been in a state of total blindness. Persons subject to this most melancholy calamity are frequently found to talk with fluency and correctness of the nature, and even outward appearance, of objects whose character they can only imagine. By the most persevering efforts they attain a knowledge of the most abstruse sciences, and arrive at a distinction not procured by those in the possession of sight. In the case of Dr Blacklock, which we have already noticed, it has been seen that a poor blind boy, by the force of his genius, and a spirit of independence, so far overcame his deprivation and the difficulties which it presented in a course of education, as to qualify himself for the office of a clergyman, and reach a respectable station in society. We have another case equally remarkable and instructive now to bring forward, namely, that of SAUNDERSON, the eminent mathematician, who was totally blind from his infancy:—

NICHOLAS SAUNDERSON was born at the village of Thurston, in Yorkshire, in 1682. He was only a year old when he was deprived, by small-pox, not only of his sight, but even of his eyes themselves, which were destroyed by abscess. Yet it was probably to this apparent misfortune that Saunderson chiefly owed both a good education, and the leisure he enjoyed, from his earliest years, for the cultivation of his mind and the acquisition of knowledge. He was sent when very young to the free school at Penniston, in the neighbourhood of his native place; and here, notwithstanding the mighty disadvantage under which it would seem that he must have contended with his school-fellows, he soon distinguished himself by his proficiency in Greek and Latin. It is to be regretted that we have no account of the mode of teaching that was adopted by his master in so singular a case, or the manner in which the poor boy contrived to pursue his studies in the absence of that sovereign organ to which the mind is wont to be chiefly indebted for knowledge. Some one must have read the lesson to him, till his memory, strengthened by the habit and the necessity of exertion, had obtained complete possession of it, and the mind, as it were, had made a book for itself, which it could read without the assistance of the eye. At all events, it is certain that the progress he made in this part of his education was such as is not often equalled, even by those to whom nature has given all the ordinary means of study; for he acquired so great a familiarity with the Greek language as to be in the habit of having the works written in it read to him, and following the meaning of the author as if the composition had been in English, while he showed his perfect mastery over the Latin, on many occasions in the course of his life, by both dictating and speaking it with the utmost fluency and command of expression.

These acquirements were due of course, in a great measure, to an excellent memory, which again owed, no doubt, much of its power and aptitude to the very difficulties under which it was obliged to exert itself. Every one of our faculties, corporeal and mental, is to a certain extent weakened, or at least prevented from reaching its utmost possible vigour and developement, by the assistance it usually receives in its labours from other faculties. Individuals deprived of the use of their hands have learned to write and paint with their toes; no reason in the world, certainly, why those in possession of the fitter and more natural instrument should relinquish it for the other, but yet an evidence of how much more some of our members are capable, and may be made by a certain discipline to perform, than we generally suppose. The German painter, Rugendas, celebrated for the spirit of his battle pieces, was originally an engraver, but

was obliged to abandon that profession in consequence of a weakness in his right hand, which, however, permitted him to manage the pencil, although not the burin, and accordingly he applied himself to painting. But, some years after, his disease increased so much, that, even for the lighter work it had now to do, his right hand became quite unserviceable; and he would have been without a profession, or any means of subsistence at all, if he had not determined to make his left hand supply the place of its disabled companion. The experiment, after being persevered in for some time, succeeded perfectly, and he came at last to use the one hand with more ease and effect than he had ever done the other.

Any one of us, it is obvious from this, might acquire for himself two right hands instead of one, if he thought it worth his while, and chose to take the requisite pains; and the same rule holds as to the other organs and higher faculties. The peculiar attribute of the eye is to distinguish colours; there is none of its other functions which may not be performed by some one or more of the other senses. But yet it does commonly serve us in a variety of other ways; or rather, by means of the power it possesses of distinguishing colours, it is able better than any of the other senses to do us certain services which yet they also might be made to perform. However convenient this arrangement may be in most respects, it is not unattended with disadvantages. If we did not possess the faculty of sight, or never opened our eyes except when we wanted merely to distinguish colours, many of our other senses and faculties would acquire a degree of power of which we have scarcely any conception. We derive more knowledge of the external world from the eye, than from all our other senses put together; for it is its power of distinguishing colours which we chiefly make use of to measure every variety of distance, form, and motion, which objects assume, and of many of them to ascertain even a multitude of other qualities. Above all, it is by this simple power of distinguishing colours that we read books, and are enabled to drink our fill from these most abounding fountains of knowledge and reflection. But even without the eye, we should not be altogether destitute of the means of forming an acquaintance with the things around us. We should only have to make our other faculties do more than they now do. Our touch would detect inequalities in surfaces that now feel to us perfectly smooth; our taste and smell would acquire a delicacy and power of discernment, which would enable them to intimate to us, with exactness, the presence or approach of many bodies and substances, by which they are now scarcely affected; our hearing would come to their aid with a fineness of perception and discrimination that would tell the direction and distance of every sound, and measure with ease, and instinctively, differences of tone which at present only the closest attention can render sensible to the acutest ear. Undoubtedly we derive all this knowledge with infinitely greater convenience through the medium of the eye, than we should do by this augmentation of the powers of our other senses, which, if so invigorated, would probably occasion us no little annoyance and discomfort, in conveying to us the information we sought from them—to say nothing of the extremely inferior degree of service they would after all render us as compared with that which we receive from the eye. But the consideration of these sleeping capabilities which are in us (beside its importance in a philosophic point of view), ought not to be without its use both in shewing us, should we be deprived of the most valuable of our bodily organs, what resources we still have for perseverance to avail itself of; and perhaps also in exciting us to bestow a little more pains than we ordinarily do in what we may call the education of those of our natural powers, which, however susceptible of being put to profitable exercise, we are apt to allow to remain inactive, merely because we do not find it absolutely necessary to make a call upon them for their services.

What has been stated may teach us at least how much more efficient we might make almost any one of our faculties, by subjecting it to the proper discipline. They are all invigorated by the habit of exertion. And more especially may the memory be rendered, by judicious cultivation, both quick and retentive, to a degree of which its ordinary efficiency seems to give no promise. In blind men this faculty is almost always powerful. Not having the same opportunities which others enjoy of frequent or long-continued observation in regard to things with which they wish to make themselves acquainted, or of repeated reference to sources of information respecting them (their knowledge coming to them mostly in words, and not through the medium of the eye, which in general can both gather what it may desire to learn more deliberately, and recur at any time for what may have been forgotten to some permanent and ready remembrancer), they are obliged to acquire habits of more alert and watchful attention than those who are beset by so many temptations to an indolent and relaxed use of their faculties, as well as to give many matters in marge to their memory which it is not commonly thought worth while to put it to the trouble of treasuring up. Their reward for all this is an added vigour of that mental power, proportioned to the labour they give it to perform. But any one of us might improve his memory to the same extent by a voluntary perseverance in something like the same method of discipline in regard to it, to which a blind man is obliged to resort. The memory is not one of the highest faculties of the mind, but it is yet a necessary instrument and auxiliary, both in the acquisition and application of knowledge. The training, too, it may be observed, which is best adapted to augment its strength, is exactly that which, instead of being hurtful to any of our other faculties, must be beneficial to them all.

On being brought home from school, young Saunderson was taught arithmetic by his father, and soon evinced as remarkable an aptitude for this new study as he had done for that of the ancient languages. A gentleman residing in the neighbourhood of his native village gave him his first lessons in geometry; and he received additional instruction from other individuals, to whose notice his unfortunate situation and rare talents introduced him. But he soon got beyond all his masters, and left the most learned of them without any thing more to teach him. He then pursued his studies for some time by himself, needing no other assistance than a good author and some one to read to him. It was in this way he made himself acquainted with the works of the old Greek mathematicians, Euclid, Archimedes, and Diophantus, which he had read to him in the original.

But he was still without a profession, or any apparent resource by which he might support himself through life, although he had already reached his twenty-fourth or twenty-fifth year. His own wish was to go to the university; but the circumstances of his father, who held a place in the excise, did not enable him to gratify this ambition. At last, however, it was resolved that he should proceed to Cambridge, not in the character of a student, but to open classes for teaching mathematics and natural philosophy. Accordingly, in the year 1707, he made his appearance in that university, under the protection of a friend, one of the fellows of Christ's College. That society, with great liberality, immediately allotted him a chamber, admitted him to the use of their library, and gave him every other accommodation they could for the prosecution of his studies. It is to be recorded, likewise, to the honour of the eccentric Whiston, who then held the Lucasian professorship of mathematics in the university (a chair in which he had succeeded Sir Isaac Newton, having been appointed at the express recommendation of that great man), that, on Saunderson opening classes to teach the same branches of science upon which he had been in the habit of reading lectures, he not only shewed no jealousy of one whom a less generous mind might not unnaturally have regarded as a rival and intruder, but exerted himself, in every way in his power, to promote his success. Saunderson commenced his prelections with Newton's Optics. The Newtonian philosophy was as yet only beginning to attract attention among the learned at Cambridge. Whiston himself informs us, in that curious production called his Memoirs, that his own attention had been first strongly excited to the Principia by a paper written by Dr Gregory (nephew of the celebrated James Gregory), when professor at Edinburgh, "wherein," says he, "he had given the most prodigious commendations to that work, as not only right in all things, but in a manner the effect of a plainly divine genius; and had already caused several of his scholars to keep Acts, as we call them, upon several branches of the Newtonian philosophy; while we at Cambridge, poor wretches! were ignominiously studying the fictitious hypotheses of the Cartesian, which Sir Isaac Newton had also himself done formerly, as I have heard him say."

The subject itself which Saunderson chose, independently of the manner in which he treated it, was well calculated to attract notice, few things seeming at first view more extraordinary than that a man who had been blind almost from his birth should be able to explain the phenomena and expound the doctrines of light. The disadvantage under which Saunderson laboured here, however, was merely that he did not know experimentally the peculiar nature of the sensations communicated by the organ of vision. There was nothing in this to prevent him from apprehending perfectly the laws of light—that it moves in straight lines—that it falls upon surfaces, and is reflected from them, at equal angles—that it is refracted, or has its course changed, on passing from one medium into another of different density—that rays of different colours are so refracted in different degrees; and the consequences to which these primary laws necessarily lead. He was not, it is true, able to see the rays, or, rather, to experience the sensation which they produce by falling upon the eye; but, knowing their direction, he could conceive them, or represent them, by other lines, palpable to the sense of touch, which he did possess. This latter was the way he generally took to make himself acquainted with any geometrical figure. He had a board, with a great number of holes in it, at small and regular distances from each other; and on this he easily formed any diagram he wished to have before him, by merely fixing a few pins in the proper places, and extending a piece of twine over them to represent the lines. In this manner, we are told, he formed his figures more readily than another could with a pen and ink. On the same board he performed his calculations, by means of a very ingenious method of notation which he had contrived. The holes were separated into sets of nine, each set forming a square, having a hole at each corner, another at the middle point of each side, and one in the centre. It is obvious that in such a figure, one pin placed at the centre might be made to stand in any one of eight different positions with reference to another pin placed on the boundary line of the square; and each of these positions might represent, either to the eye or the touch, a particular number, thus affording signs for eight of the digits. Saunderson used to employ a pin with a larger head for the central hole; so that even when it stood alone, it formed a symbol easily distinguishable from any other. Lastly, by using two large-headed pins in one of the positions, instead of one with a large and another with a small head as usual, he formed a tenth mark, and so obtained representatives for the nine digits and the cipher—all the elementary characters required, as every one knows, in the common system of notation. Here, then, were evidently the means of performing any operation in arithmetic.

In a description of this contrivance, which we have from the pen of Mr Colson, Saunderson's successor at Cambridge, we are assured that its inventor, in making use of it, "could place and displace his pins with incredible nimbleness and facility, much to the pleasure and surprise of all the beholders. He could even break off in the middle of a calculation, and resume it when he pleased, and could presently know the condition of it by only drawing his fingers gently over the table." But Saunderson was also wont to perform many long operations, both in arithmetic and algebra, solely by his powerful and admirably disciplined memory. And his mind, after having once got possession of even a very complicated geometrical figure, would, without the aid of any palpable symbols, easily retain a perfect conception of all its parts, and reason upon it, or follow any demonstration of which it might be the subject, as accurately as if he had it all the while under his eye. It occasionally cost him some effort, it was remarked, to imprint upon his mind, in the first instance, a figure unusually intricate; but when this was once done, all his difficulties were over. He seems indeed to have made use of sensible representations chiefly in explaining the theorems of science to his pupils. In the print prefixed to his Algebra he is represented discoursing upon the geographical and astronomical circles of the globe, by the assistance of an armillary sphere constructed of wood. His explanations were always remarkable for their simplicity and clearness, qualities which they derived, however, not from any tedious or unnecessary minuteness by which they were characterised, but from the skill and judgment with which he gave prominence to the really important points of his subject, and directed the attention of his hearers to the particulars most concerned in its elucidation.

His ability and success as a teacher continued and augmented that crowded attendance of pupils, which, in the first instance, he had owed perhaps principally to the mere curiosity of the public. Every succeeding university examination afforded additional evidence of the benefit derived from his prelections. His merits, consequently, were not long in being appreciated both at Cambridge and among scientific men in general. He obtained the acquaintance of Sir Isaac Newton, his veneration for whom was repaid by that illustrious philosopher with so much regard, that when Whiston was expelled from his chair in 1711, Sir Isaac exerted himself with all his influence to obtain the vacant situation for Saunderson. On this occasion, too, the heads of colleges applied to the Crown in his behalf to issue a mandate for conferring upon him the degree of Master of Arts, as a necessary preliminary to his election; and their request being complied with, he was appointed to the professorship. From this time Saunderson gave himself up almost entirely to his pupils. Of his future history we need only relate, that he married in 1723, and was created Doctor of Laws in 1728, on a visit of George the Second to the University, on which occasion he delivered a Latin oration of distinguished eloquence. He died in 1739, in the 57th year of his age, leaving a son and daughter.—*Abridged from Library of Entertaining Knowledge.*

SPECTRES.

A man would not only be very rash, but also very extravagant, who should pretend to prove that there never was any person that imagined he saw a spectre; and I do not think that the most obstinate unbelievers have maintained this. All that they say amounts to no more than that the persons who have thought themselves eye-witnesses of the apparitions of spirits had diseased imaginations. They confess, then, that there are certain places in our brain, that, being affected in a certain manner, excite the image of an object which has no real existence out of ourselves, and make the man whose brain is thus modified believe he sees at two paces' distance a frightful spectre, a hobgoblin, a threatening phantom. The like happens in the heads of the most incredulous, either in their sleep or in the paroxysms of a violent fever. Will they maintain after this, that it is impossible for a man awake, and not in a delirium, to receive in certain places of his brain an impression almost like that which, by the laws of nature, is connected with the appearance of a phantom? If they are forced to acknowledge that this is possible, they cannot promise that a spectre will never appear to them; that is, that they shall never when awake believe they see either a man or a beast when they are alone in a chamber.—*Bayle's Dictionary*, Art. HOBBES.

LITERARY HISTORY OF THE BIBLE.

INTEGRITY OF THE TEXT.

THE sacred books which were written, as we have seen, in Hebrew, the language of the patriarchs, have been preserved down to our days without any corruption; and the same judgment may also be formed of those other books of Scripture which have been since written in Greek. But before proving the purity and integrity of these original texts, it may be necessary to remove a prejudice which may arise from the variety of different readings that are found in the manuscript and printed copies of the Bible.

The different manner in which some passages are expressed in different manuscripts, together with the omission or insertion of a word, or of a clause, constitute what are called *various readings*. This was occasioned by the oversights or mistakes of transcribers, who deviated from the copy before them, these persons not being, as some have supposed, supernaturally guarded against the possibility of error; and a mistake in one copy would, of course, be propagated through all that were taken from it, each of which copies might likewise have peculiar faults of its own, so that various readings would thus be increased in proportion to the number of transcripts that were made. Besides actual oversights, transcribers might have occasioned various readings by substituting, through ignorance, one word, or even letter, in place of another; they might have mistaken the line on which the copy before them was written, for part of a letter, or they might have mistaken the lower stroke of a letter for the line, and thus have altered the reading; at the same time they were unwilling to correct such mistakes as they detected, lest their pages should appear blotted or defaced; and thus they sacrificed the correctness of their copy to its fair appearance. Copiers seem, not unfrequently, to have added letters to the last word in their lines, in order to preserve them even, and marginal notes have been sometimes introduced into the text. These different circumstances, as well as others with which we may not be acquainted, did no doubt contribute very much to produce and multiply mistakes and variations in the manuscripts of the Hebrew Scriptures. This language is more susceptible of corruption, and any alteration would be more detrimental in it than in others. In English, if a letter be omitted, or altered, the mistake can be easily corrected, because the word thus corrupted may have no meaning; but in Hebrew, almost every combination of the letters forms a new word, so that an alteration of even one letter of any description is likely to produce a new word and a new meaning. Thus, putting all alterations made knowingly, for the purpose of corrupting the text, out of the question, we must allow that from these circumstances connected with the transcribing, some errata may have found their way into it, and that the Sacred Scriptures have in this case suffered the fate of other productions of antiquity.

When we have collected all the differences that are found in manuscripts of the original text, and have selected from them what are really various readings, we are able to determine, from the number and authority of the manuscripts, with tolerable correctness, what is the genuine reading. Beside the authority of the manuscript, we must also be guided in determining the true reading by the scope of the passage, by the interpretations and quotations of ancient writers, by the old versions, and not unfrequently by Scripture itself; for similar or parallel passages will often be found useful for this purpose. When all these things are considered, it will seldom happen that the true reading of a passage will be doubtful; yet should it continue so, either reading may contain a truth, though certainly *both* cannot be *authentic*, and in a theological point of view, either of them may be followed, without involving a doctrinal error; and in such a case, the common reading should not be relinquished.

To a person who has not considered the subject closely, it may appear sufficient to overthrow the authority of the text, that no less than *thirty thousand* various readings of the scriptures of the Old and New Testaments have been discovered. But when these are examined closely, and all that are not *properly* various readings are rejected, the number will be considerably diminished; from these again let all be deducted which make no alteration in the several passages to which they refer, and the reduction will be much greater; and out of the remainder there are none found that can invalidate the authority of those doctrines that have been esteemed fundamental, or that can shake a single portion of that internal evidence whereby the divine origin of the Scriptures is supported; so that the friends of revelation had no grounds for the alarm they felt at the time when the subject of various readings began to be discussed. These observations apply strongly to the New Testament, which, as it has been transcribed more frequently, and probably by less skilful transcribers than the Old, has in proportion many more various readings. Respecting these, however, it has been said, "that all the omissions of the ancient manuscripts, put together, would not countenance the omission of any essential doctrine of the gospel, relative to faith or morals; and all the additions countenanced by the whole mass of manuscripts already collated, do not introduce a single point essential either to faith or morals, beyond what may be found in the Complutensian or Elzevir editions."*

The manner in which the original text of the Scriptures, particularly the Hebrew, has been preserved free from all material corruption, and handed down pure through such a long succession of ages, may now form the subject of our especial consideration.

It has been supposed by many that the Christian fathers accused the Jews of corrupting the text; but from an examination of such passages as seem to imply this, it appears that they spoke not of corrupting the text, but of adopting unfaithful translations. Justin Martyr, one of the most celebrated of the Christian fathers, defends the Jews very well as to this point, and proves that they have not corrupted the Scriptures: and it is past doubt that they have not; for, as St Jerome observes, before the birth of Jesus Christ they had certainly made no malicious alterations in them. If they had done so, our Saviour and his Apostles, who cast so many reproaches upon the Scribes and Pharisees, would not have passed over in silence so great a crime. To suppose such a thing, indeed, were to know little of the attachment of the Jews for the Scriptures. Josephus and Philo assure us that they would have undergone all sorts of torments rather than have taken a letter from the Scripture, or altered a word in it. A copy which had only one fault in it was by them thought polluted, and was not suffered to be kept above thirty days; and one that had four faults was ordered to be hid in the earth. In the Babylonian Talmud it is laid down as a regulation, that "the books of the law which have been written by a heretic, a traitor, one who is a stranger to the Jewish religion, an idolatrous minister—by which they mean a monk—a slave, a woman, one under age, a Cuthæan or Christian, or an apostate Israelite, are unlawful."

"This," says St Augustine, "is a most visible effect of the providence of God over his church. It pleased him that the Jews should be our librarians; that, when the Pagans reject the oracles of the ancient prophets concerning Jesus Christ, which we quote against them as being invented by us, we might refer them to the enemies of our religion, who will shew them in their books the same prophecies which we quote against them."

The class of Jewish doctors called Massorites were grammarians who engaged with peculiar ardour in the revisal of the Hebrew Scriptures. The Massoritic notes and criticisms relate to the verses, words, letters, vowel-points, and accents. All the verses of each book and of each section are numbered, and the amount placed at the end of each in numerical letters, or in some symbolical word formed out of them; the middle verse of each book is also marked, and even the very letters are numbered; and all this is done to preserve the text from any alteration, by either fraud or negligence. For instance, Berēshith, or Genesis, is marked as containing 1534 verses, and the middle one is at—"And by thy sword thou shalt live" (xxvii. 40). The lines are 4395; its columns are 43, and its chapters 50. The number of its words is 27,713, and its letters are 78,100. The Massoritic notes, or Massorah, as the work is called, contain also observations on the words and letters of the verses; for instance, how many verses end with the letter *samech*; how many there are in which the same word is repeated twice or thrice; and other remarks of a similar nature.

It seems now generally agreed upon that the Massorites of Tiberias, during the fourth century of the Christian era, were the inventors of the system of the *vowel-points and accents* in the Hebrew Bible; and although they multiplied them very unnecessarily, it must be allowed that this is the most useful of their works. From the *points* we learn how the text was read in their time, as we know they were guided in affixing them by the mode of reading which then prevailed, and which they supposed to have been traditionally conveyed down from the sacred writers.

The Massoritic notes were at first written in separate rolls, but they are now usually placed in the margin, or at the top and bottom of the page in printed copies. Many opinions are entertained about the authors of them; some think they were begun by Moses; others regard them as the work of Ezra and the members of the great synagogue, among whom were the later prophets; while others refer them entirely to the Rabbins of Tiberias, who are usually styled the Massorites, and suppose that they commenced this system, which was augmented and continued at different times by various authors, so that it was not the work of one man, nor of one age. It is not improbable that these notes were begun about the time of the Maccabees, when the Pharisees, who were called the Masters of Tradition, first began to make their observations on the *letter* of the law, though they were regardless of its *spirit*. They might have commenced by numbering first the verses, next the words and letters; and then, when the vowel-points were added, others continued the system by making observations on them. On the whole, then, it appears that what is called the Massorah is entitled to no greater reverence or attention than may be claimed by any other human compilation; but, at the same time, it must be allowed that it has preserved the Hebrew text from the time it was formed, and conveyed it to us as perfect as any ancient work could be given.

The various readings given in the Hebrew Bibles, and which are technically denominated by the Jews the *Keri* and *Cetib*, are not to be ascribed to Moses or the prophets, for it cannot be supposed that inspired writers were ignorant of what was the true reading of the Scripture text. One principal occasion of the notes of the Keri and Cetib is, that there are several words which the Jews, either from superstitious reverence or from contempt, are never allowed to pronounce. When they meet with them in the text, instead of pronouncing them, they pronounce others that are marked by certain vowels or consonants in the margin. The chief of these is the great name of God JEHOVAH, instead of which they always read *Adonai*, Lord; or *Elohim*, God. This is the word called *Tetragrammaton*, or the ineffable name of God, consisting of the *four letters*, *Yod*, *He*, *Wau*, *He*. The people were not suffered to pronounce it; the high-priest alone had that privilege, and that only in the temple once a-year, when he blessed the people on the great day of atonement; and from hence it is, that, as this holy name has not been pronounced since the destruction of the temple, its true pronunciation is now lost. Galatinus, in the sixteenth century, was the first who thought fit to say, that it ought to be pronounced *Jehovah*. "Which did not happen," says Père L'Amy, "without a very particular providence of God, who was pleased, that, when the Jews lost the temple in which the true God was worshipped they should at the same time lose the true pronunciation of his august name. It happened, I say, because, being no longer willing to be their God (for the destruction of the temple was an authentic testimony of the divorce which he gave them), he would not leave them the power of so much as pronouncing his name."*

Josephus, himself a priest, says, it was unlawful for him to speak of the name whereby God was made known to Moses; and if it be true that the pronunciation of it was connected with the temple service, it is not surprising that all trace of it should be lost when the temple was destroyed, and when the Jews grew every day more superstitiously afraid of pronouncing it. Leusden, the great orientalist, is said to have offered a Jew at Amsterdam a considerable sum of money if he would pronounce it only *once*, but in vain.

Besides the various readings called the *Keri* and *Cetib*, which the Jews admit to be the oldest, there are two other kinds of various readings which deserve our notice, because they are given in some printed Bibles. The first are those of the Eastern and Western Jews; the second, those between the manuscripts of Ben Asher and Ben Naphtali. By the Eastern Jews we are to understand those of Babylon; by the Western, those of Palestine. At Babylon and in Palestine, after the destruction of the city and temple, there were famous schools for many ages, and between the learned men of these places much rivalship existed; so that each party, by following their own copies, gave rise to a collection of various readings, or corrections of the text, whose antiquity is acknowledged, though it does not appear exactly at what time it was made.

The other collection is called after the heads of two celebrated schools—Ben Asher, at Tiberias, and Ben Naphtali, at Babylon; who were two famous Massorites, that lived about the year 1030, and were the last of them. Both of these Rabbies laboured to produce a correct copy of the Scriptures, and the followers of each corrected theirs by that of their master. The variations between them relate to the *points*, and in but one instance is there any difference in the writing of a word; so that they do not affect the integrity of the text.

What has been said of the integrity of the text of the Old Testament, may be applied also to the New, in so far as it may be charged with corruptions, in consequence of the negligence of transcribers, as also in consequence of the attempts of heretics, to make it conform to their erroneous sentiments. Though it must be admitted that the New Testament text, by being more frequently transcribed than that of the Old, became liable to a greater proportion of various readings, originating from the mistakes of the transcribers, yet this very circumstance was likewise a sure protection against wilful perversion or corruption; for in proportion as copies were multiplied, the difficulty of effecting a general corruption was increased. No such system as that of the Massorites was ever adopted to preserve the purity of the New Testament text; but we have it in our power to use various means for ascertaining what is the true reading of the text, without having recourse to such a plan as that of the Massorah; and Concordances, which

* Vide Dr Adam Clarke's Tract on the Editions of the New Testament.

* Vide "Apparatus Biblicus, or An Introduction to the Study of the Holy Scriptures."

are now brought to an uncommon degree of perfection, are of great use in preserving it from corruption; in fact, the single one of Buxtorf has done more toward fixing the genuine reading, and pointing out the true meaning of Scripture, than the entire body of the Massoritic notes. We have the consent of the church, in all ages and countries, to prove our copies of the New Testament Scriptures authentic, and the authenticity of the Hebrew text is confirmed by Christ and his Apostles; and, in concluding this part of the subject, it may be remarked, that the general integrity of the Hebrew text receives additional confirmation from the ancient versions, as will more fully appear hereafter.

A HIGHLAND SETTLER.

THE best method of illustrating the prosperity of settlers (says M'Gregor, in his excellent work on British America), is by stating instances of individual success. Among the settlers in New Brunswick, I had some conversation with an old Highlander, from Sutherlandshire, one of the soldiers of the 42d regiment, who were disbanded in America after the revolutionary war. This man had settled on the banks of the Nashwaack, and had scarcely ever since been absent from his farm, except occasionally with his overplus corn or potatoes to Fredericton. He retained his native language with as much purity as if he had never removed from the vale in which he was born, by which I immediately discovered where he came from; the tone and accent of the Gaelic varying as much in one shire, or in one of the isles of Scotland, from the others, as the pronunciation of the inhabitants of the several counties in England does. When I addressed this good old man in his native language, his very soul seemed to feel all the rapture of early enthusiasm; and I can never forget the bright warmth of his countenance, and the ardour of his language, when inquiring about the state of the Highlands, and the condition of his countrymen. He said he used for the first few years to receive now and then letters from his friends, but that his relatives gradually dropped off, some by death, others by removal to distant countries; and that for the last twenty years he had no direct intelligence from Sutherland. Never could his country, however, cease to be dear to him. "Never," said he, "will we forget the tales, the songs, and the music we heard in the Highlands; we recite or sing them during the winter evenings, and our children will ever remember them, and, I hope, transmit them to their offspring." He said, that although government did much for them (his neighbours and himself), they nevertheless suffered very great hardships for the first few years after settling where they now live. "There were some idlers and faint-hearted people," he said, "among us who left the settlement, but all those who have remained have prospered. I am myself as comfortable as I can be. All my family are married; some of them live with me; others have farms of their own. I have very little to do but enjoy myself among my children and my grandchildren; and although the best years of my manhood were spent fighting for my king, and the greatest part of my life since that period has been spent toiling for the support of my family, and for whatever I now possess; yet I have great reason," he continued, "to be thankful and grateful to God, in whom I trust, for a peaceful and calm retreat, through my declining years, to another world." This is nearly a translation of what he said, but destitute of the force of expression so peculiar to the language in which he spoke—that of nature.

PRACTICAL VULGAR FRACTIONS.

A PRACTICAL method for understanding vulgar fractions was proposed by a German author, Mr Feinaigle, which renders this puzzling portion of arithmetic much plainer than it usually appears to young scholars. The method is as follows:—Cut a piece of paper into the form of a circle; or, what children may understand better, take a *bannock*, or round barley cake, and make a mark in its centre: through this draw two lines (at right angles to each other), cutting the circle into four equal parts; each of these will of course be a *fourth* part of one circle or one cake; two of them will be two-fourths of the same; three will be three-fourths. With these four pieces, an exemplification may be given of all the complex rules of vulgar fractions. A child will see at once that *two-fourths* make *one-half;* if each of the fourths be divided into two, he will perceive that there are eight in all, and that of course the *half of one-fourth* is *one-eighth:* if the *fourths* (or quarters) be divided each into three parts, his eyes will tell him that there are now twelve parts, and that therefore the *third part of one-fourth* is *one-twelfth* of the whole. Take four of these twelfth parts, and he will see by what remains that *four-twelfths* make *one-third*, and six-twelfths one-half, &c. If any teacher or father of a family will give himself the trouble to try this method, he will find that the bugbear of fractions, which is such a hobgoblin to young arithmeticians, will disappear in one or two lessons, and the scholar will acquire clear ideas on the subject easily. The notation of fractions should not be taught till after these elementary ideas are familiar. A child, to whom the abstract character $\frac{3}{4}$ or $\frac{7}{9}$ is a mystery, will easily comprehend its meaning when it comes in the shape of certain *lectors* of a round cake, or, what may answer very neatly, of a slice of orange.

THE WIFE OF AUCHTERMUCHTIE.

[The ancient Scottish poem of this name has been long a favourite in the "north countrie," being highly relished for its quaint rustic humour, and for the excellence of its moral, which is, simply, that each sex should not envy the apparent comforts and the pursuits of the other, but be contented with the lot assigned by Providence. The following version may be considered among the most accurate, and, though some of the words may, perhaps, be unintelligible to the English, nay, even the modern Scottish reader, any translation would greatly injure not only the wit, but the meaning of the phraseology. Auchtermuchtie is a village lying at the centre of the county of Fife.]

In Auchtermuchtie thair wond ane man,
A rach husband, as I hard tauld,
Quha weill could tippill out a can,
And naither luvit hungir nor cauld:
Quhill ance it fell upon a day,
He yokkit his pleuch vpon the plaine;
Gif it be true, as I heard say,
The day was foull for wind and raine.

He lousit the pleuch at the landis end,
And draife his oxin hame at evin;
Quhen he cam in he lukit ben,
And saw the wif baith dry and clene
Sittand at ane fyre beik and bauld,
With ane fat sowp, as I hard say:
The man being verry weit and cauld,
Betwein thay twa it was na play.

Quoth he, Quhair is my horsis corne?
My ox hes naithir hay nor stray;
Dame, ye maun to the pleuch the morn,
I sall be hussy, gif I may.
Gudeman, quoth scho, content am I
To take the pleuch my day about,
Sa ye will rewll baith calvis and ky,
And all the house baith in and out.

But sen that ye will hussyskep ken,
First ye maun sift and syne maun knead;
And ay as ye gang but and ben,
Luk that the bairnis fyle not the bed;
And ay as ye gang furth and in,
Keip weill the gaizlines fra the gled;
And lay ane saft wysp to the kill:
We haif ane deir ferme on our heid.

The wyfe scho sat vp late at evin,
(I pray God gif hir evill to fare),
Scho kirnd the kirne, and skumd it clene,
And left the gudeman but the bledoch baire:
Than in the morning vp scho gat,
And on hir hairt laid hir disjune.
And friend als meikle in hir lap
Micht serve thrie honest men at nune.

Says—Jok, will thou be maister of wark,
And thou sall haud, and I sall kall;
I'se promise the ane gude new sark,
Outhir of round claith or of small.
Scho lowsit the oxin aught or nine,
And hynt ane gad-staff in hir hand:
Vp the gudeman raise aftir syne,
And saw the wyf had done command.

He cawd the gaizlines furth to feid,
Thair wes bot sevensum of them all;
And by thair cumis the greedie gled,
And cleiket vp fyve, left him bot twa:
Than out he ran in all his mane,
Sune as he hard the gaizles cry;
Bot than, or he came in againe,
The calfes brak luse and soukit the ky

The calfes and ky met in the lone,
The man ran with ane rung to red;
Than thair comes ane ill-willie kow
And brodit his buttok quhill that it bled,
Than up he tuik ane rok of tow,
And he satt down to sey the spinning;
I trow he loutit owre neir the lowe;
Quo he, this wark hes an ill beginning.

Then to the kirn he next did stoure,
And jumlit at it quhill he swat:
Quhen he had rumblit a full lang hour,
The sorrow scrap of butter he gatt.
Albeit na butter he could gett,
Yet he wes cummerit with the kirne;
And syne he het the milk owre het,
And sorrow a drap of it wald yirne,

Then ben thair cam ane greidie sow,
I trow he kund hir littil thank,
For in scho schot hir ill-fard mow,
And ay scho winkit and ay scho drank.
He cleikit vp ane crukit club,
And thocht to hit her on the snout;
The twa gaizlines the glaidis had left,
That straik dang baith their harnis out.

He set his foot vpon the spyre,
To have gotten the fleshe doun to the pat,
Bot he fell backward into the fyre,
And clourd his croun on the keming stock.
He hang the meikle pat on the cruik,
And with twa canns ran to the spout,
Or he wan back againe (alaik)
The fyre burnt all the boddom out.

Than he laid kindling to the kill,
Bot scho start all vp in ane low;
Quhat evir he heard, quhat evir he saw,
That day he had na will to wow.
Than he gaid to take vp the bairnis,
Thocht to have fund thame fair and clene;
The first that he gat in his armis
Was all bedirtin to the eyne.

The first that he gat in his armis,
It was all dirt up to the eyne;
The de'il cut aff thair hands, quo he,
That filld yow all sa fou yestrein.
He traillit the foull sheetis down the gait,
Thocht to haif wascht thame on ane stane;
The burne was risin grit of spait,
Away fra him the sheetis hes tane.

Than up he gat on ane know head,
On the gudewyfe to cry and schout;
Scho hard him as she hard him nocht,
But stoutlie steird the stottis about.
Scho draif the day unto the nicht,
Scho lowsit the pleuch and syne cam hame;
Scho fand all wrang that sould bene richt,
I trow the man thocht richt grit schame.

Quoth he, My office I forsaik,
For all the dayis of my lyfe;
For I wald put ane house to wraik
Gin I war twentie dayis gudewyfe.
Quoth scho, Weill mot ye bruke your place,
For trewlie I sall neir accept it;
Quoth he, Feind fall tha lyaris face,
Bot yit ye may be blyth to gett it.

Than up scho gat ane meikle rung,
And the gudeman maid to the doir;
Quoth he, Deme, I sall hald my tung,
For an we fecht I'll gett the waur.
Quoth he, Quhan I forsuik my pleuch,
I trow I bot forsuik my scill,
Sa I will to my pleuch agane,
For this house and I will nevir do weill.

HABITS OF THE AMERICANS.

I DO not think the dinner ever consumed above twenty minutes before the party, at least the permanent boarders, separated, and were out of the house, in order to attend to business again. There was brandy on the table, and beer, or rather ale, but water was far more generally used by the Americans. Mr Smith had an Edinburgh cook, formerly in Lady Sinclair of Murkle's house; and sometimes there were Scotch dishes, even a haggis, sheep's head, minced collops, &c., but the Americans had no great relish for them. They care more for roast beef, beef steak, roasted turkey, and apple and pumpkin pie, than for any thing else. There was one male servant, an American, at this boarding-house, who seemed to attend to his duty well, and constantly, but his manners are as different as possible from those of a British servant. No obsequiousness; nor would he, I suspect, have touched his hat on passing one of the inmates of the boarding-house for the world. There is, however, no want of civility, but it is expected to be shewn to servants as well as by them. Even the blacks and free colour people address each other by the ordinary appellations of sir and madam; and the people generally, when speaking of any one in his absence, call him citizen.

The kindness and hospitality of the Americans are quite unostentatious. I write, however, of the mass of the people and without reference to the small number of people, who consider themselves the great in this country. An invitation to dinner is generally given in such words as these:—"I will be pleased to see you at two o'clock." Frequently no change whatever is made in the dinner, supposing you to accept. Your friend knows that there is always abundance of good food upon his table. That degree of attention is shewn you which a stranger meets with every where, in seeing that his plate be filled, in the first instance, with what he likes, but no pressing or entreaty are used to make him eat or drink more than he likes. If wine is produced, it is left to him to partake of it or not as he chooses. There is hardly ever any talk about the dinner, or the quality of the wine, which you are not provoked to drink by being told how many years it has been in your friend's cellar, or to what vintage it belongs.

I am far, however, from doubting the sincerity of the hospitality of the people of this country, as some travellers have done, although formal invitations may not be so generally given as with us. While, however, I am on the contrary persuaded that invitations are seldom given when there is not a real wish that the invited should accept them, I must at the same time confess, that I like the style of entertaining friends to which I have been accustomed, and which prevails in Britain, better than in the United States. I prefer the warmth of manner with which (whether apparent or real) a British landlord exerts himself to induce his guests to partake liberally of the good things, both eatable and drinkable, which he has prepared for them, by agreeable conversation, and by descanting on the feeding of his beef, or the age of his mutton, or the excellence of his wine—to the merely passive, perhaps indifferent looking manner, as it seems to us, of the Americans. In Britain, even at a public table, those sitting next each other attend to each other's wants, and recommend to them any thing which is within their reach, which they think particularly good; and I do not see that the conviviality of the party is not at least as much enjoyed when the conversation relates to the quality of the provisions, their cookery, and the excellence of the wine—subjects which are level to the capacity of all—as when it relates to an investment of cotton, or to the repeal of the tariff; subjects in which those addressed may take little or no interest. It would be easy to multiply instances to show how much the desire of making money constantly engrosses the thoughts of all, both young and old, in this country.—*Stuart's "Three Years in America."*

Messrs W. and R. CHAMBERS are happy to state, that the demand for their various publications continues to increase throughout every part of Great Britain and Ireland. Of the *Journal*, 55,000 copies are sold weekly; of the *Information for the People*, which is issued once a fortnight, upwards of 15,000 copies were disposed of, in Scotland alone, on the first day of publication; and of the *Historical Newspaper*, 28,000 copies continue to be sold monthly. Messrs CHAMBERS observe without dissatisfaction, that the Society for the Diffusion of Useful Knowledge have again paid them the compliment of imitating their publications, by the announcement of a work similar to their Monthly Newspaper.

ERRATUM in No. 60, page 60.—The number of degrees from the pole, at which plants and animals exist, was accidentally omitted: "about ten" degrees should have been indicated.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER" AND "INFORMATION FOR THE PEOPLE."

No. 62. SATURDAY, APRIL 6, 1833. PRICE THREE HALFPENCE.

THE PEGHLER.*

It is long since the natural history of such creatures as the lion, the horse, and the elephant, was perfectly ascertained and understood. Every body now knows every thing that can be known about such honest, downright, plain-sailing animals; and zoophytes are all the rage. It would be quite in vain that you busied yourself in the East Indies in the amiable task of catching and stuffing tigers, in order that you might send them home to the Museum of the Edinburgh University, or that of the Wernerian Society. I verily believe that Professor Jameson would not thank you for a shipload of such intelligible stuffery. But mark the eyes of a naturalist when you tell him of some new marine creature, half vegetable half animal, which springs up in the shape of a tumbler, with something like an umbrella and stalk in the middle, and perhaps fixes itself to the ground by a few dozen legs, each with fifteen eyes in a row along the side, like the buttons of a pair of spatterdashes. The man's face kindles at the description, like a coal under a pair of bellows; and if you can be so patriotic as to transfer the specimen to a neighbouring pond, there to flourish in immortal youth for the benefit of all whom it may concern, why, you will find yourself next week with as many initial letters tagged to your name as might qualify you for becoming editor of an encyclopædia.

In the same way as regular proper birds and beasts have how ceased to possess any interest, so have the ordinary characters of society fallen into a kind of contempt in our literature. It was very well for Homer to describe heroes like Achilles and Agamemnon; and for the Spectator to talk of such men as Will Honeycomb or Sir Roger de Coverley. These personages were like the horse and the lion in the infancy of natural history. But any thing like a full-grown, healthy, natural man, is now of no use. Every body knew all about him ages ago. If you want proper subjects for the moral museum, you must poke into the holes and corners of human nature—you must dive far beneath the surface, and "pluck up drowned *horrors* by the locks." In short, it will not do now-a-days to describe any thing but nondescripts.

Acting under this impression, I take leave to introduce the genus *Peghler* to the notice of the world—a creature who, neither in town nor country, is any thing very decidedly, but yet may be described, I doubt not, in such terms as to awaken a full recollection of him in the mind of every reader.

The Peghler is a person in humble life, who assumes no distinct profession, but contrives to live a curious irregular life by means of all kinds of out-of-the-way bargainings, and contracts for work; his habits being generally in a considerable degree determined by the accident of his living in a city or in the country. He is usually a short, active-looking man, with coarse grey stockings, corduroy breeches, and a seven-days' beard. His neckcloth is one hard roll of red or blue cotton, enclosing a collar, which, evidently, has never yet been made acquainted with the mysterious process invented by Brummel. His watch is a little spherical silver one, with Roman numerals; its chain is steel, and consists of a series or conseries of chains, interrupted every two or three inches by little flat plates, and garnished at the end with an old-fashioned pebble seal, a George-the-Second sixpence, a small Indian shell, and a key formed on three angles, like the human figure when sitting. The town Peghler lives about such places as the Cowfeeder Row, the Back of the Canongate, and a certain *terra Australis incognita*, which bears, I believe, the name of the Causewayside. He has generally a concern in some grass park in the neighbourhood, where he keeps a cow or horse when he happens to buy one. He is always a married man, with a vast number of children, whom he is rigorous in setting to work as soon almost as they are able to walk. Though invariably rather wealthy than otherwise, he is a great economist in his household. He buys the most of his provisions in a growing or living state. In June, you find him attending a sale of standing grain, where, if he does not bid largely in a wholesale capacity, he at least purchases an acre or two for his own meal. This is reaped by his own children—put into sheaves by himself (for he is a capital bandster)—thrashed also by himself—ground at a mill in which he has some concern—and brought home by his own horse and cart. In October, you see him attending a sale of growing potatoes—perhaps he buys a whole field on speculation—possibly only an acre for his family. At the very worst, he sees how potatoes are going—enjoys the honour of having his advice asked by the less experienced, and partakes, however fruitlessly, of the bottle which has been paraded for the purpose of encouraging the sale. The Peghler frequents all kinds of markets. At Dalkeith he goes like a bee from flower to flower. He dives his hand deep into every bag—feels the contents, with a knowing air, between his finger and thumb—tastes it with an air still more knowing—and, after asking the price, remarks, if he does not mean to buy, that it is "a good meal." When he has made a purchase, he pays for it either in notes drawn from a huge worn pocket-book, which seems almost in itself a bank, or by what he calls "a bit check on Sir Willie."*

In his capacity of corn-factor upon a small scale, the Peghler is a great adept in all matters connected with farm produce, and whatever may increase or depress its value. Not a cloud can cross the horizon, but he knows what effect it is to have next Friday at Haddington. He will, by a mysterious algebra peculiar to himself, weigh off the depth of water at the Observatory, or, what is more in his way, the pools which he finds in the morning before his door, against the scale of prices at Dalkeith, and you would be astonished at the accuracy of the calculation. I once came upon a Peghler in the course of a country walk. He was leaning over the gate of a barley field; and, if he had not borne all the external marks of a declared and licensed Peghler, I could have known him by the considerate calculating air with which he marked the rising braird. I entered into conversation with him, and remarked that that was a fine field of barley. "Yes," he said, drily, "it's gude beare; but, man, ye dinna ken hoo it *is* gude." The Peghler, I saw, approved of the grain, by virtue of his intimate and actual acquaintance with the subject: he knew it to be good, perhaps, from his certainty as to the goodness of the soil, the sufficiency of the manure, the excellent labour which had been bestowed upon it, besides a minute examination of all the outward symptoms. But he saw, from my city aspect, that I only thought it good because the field bore a verdant appearance. He thought me, in short, as green as the barley; and his conscious skill could not respond even to my humble remark, without letting me see that he did so upon different and deeper principles. "Yes—it's gude beare; but, man, ye dinna ken hoo it *is* gude!" The Director-General of the fine arts could not have more expressively marked his contempt for some raw exclamation about a picture, such as "How pretty!" Verily, thought I, there is no department of knowledge without its pride of skill.

But the Peghler is a person of multiform appearance, and endless varieties of employment. Sometimes he steps into a place where turnpikes are rouping; and, if the thought strikes him, he will take a few tolls, into which, next week, he has planted off almost all the grown-up members of his family. You have, perhaps, left off acquaintance with a particular Peghler, as contractor for building a dyke near your residence in the country; and the next time you see him, he is ascending from a hole in the street, being busied in forming a new drain. Some days afterwards, when you are in quest of a house against next Whitsuntide, you find yourself waited upon by this identical Peghler, as an emissary of the landlord. It is a great employment of the Peghler to let houses. This is just one of those irregular kinds of business which the city Peghler rejoices in. He is indeed so fond of it, that he often sinks his own gains in house property. You find him at a sale of what are called "old materials," namely, the stone and wood-work of a house about to be taken down, to admit, perhaps, of some public work. He is flying along crazy joists, while pulverised lime wraps him all around, the very demon of dust! He buys the whole for a few pounds, and, some weeks after, a house, perhaps occupied in former times by "lords and ladies gay," rises in a new shape in the suburbs, for the accommodation of humble artizans, whom the Peghler has the pleasure of *persecuting* twice or oftener in the year for ever after. The Peghler, in his capacity of landlord, becomes acquainted with a property in human nature, which has hitherto been supposed to reside exclusively in certain classes of birds. This is a disposition to migrate, which prevails among his tenants at particular seasons, generally about three weeks previous to the 25th of May and the 22d of November. It is incalculable the trouble which he and his whole race and kindred have, about those periods, in watching the motions of the tenantry. He wanders nightly like a ghost about "the property;" and if he sees a light in a window after midnight, he is thrown into an agony, lest a removal is contemplated. His children rise at different periods of the night to relieve guard; but even while he sleeps, he thinks he sees his vassals flying away with their goods and chattels, in order to avoid being troubled about that rending misery—rent. If all keeps fair till term-day, he goes his rounds with a gracious countenance, mumbling to every tenant some complimentary speeches, in which the word "convenient" is alone heard, but, in being heard, is enough. Perhaps, instead of rent, he is met with some flaming complaint as to the want of repairs; but unless he receives payment of his demands, he turns a deaf ear to all such memorialists. If payment be really made, then he makes it his endeavour to soothe the complainants as much as possible. There is no black so very black, nor no white so very white, but he will make it look a little better. The roof may show a breach through which the tenant can see ten degrees of the blue empyrean; but, in the Peghler's mind, every thing may be cured by "a little plaister." "A little plaister" is his catholicon for all evils; and "that he will come and apply himself, some day very soon." He will never admit any fault in his pro-

* To peghle, or pechle, is the Scottish expression for the English pant, or to be short-winded. *Peghler* is a noun formed for the occasion from that verb, in order to describe, by one of his most noted characteristics, a person who has many curious properties, and who would, by many, be described as a Jack-of-all-Trades. The present sketch originally appeared in Mr Tait's Edinburgh Magazine, to which it was contributed by one of the individuals now concerned in Chambers's Edinburgh Journal. It is transferred to its present place, in the hope of its falling under the attention of a circle of readers different from that to which it has been already introduced.

* It is necessary to explain to the southern reader that Sir William Forbes and Co. were for a long time the bankers in highest consideration in Scotland, especially among the rural classes.

perty, which it is beyond his own personal skill to correct; no more than Dr Poppleton would acknowledge the existence of any disease which might not be cured by his own pill. He has been heard, in extraordinary cases, to speak of such a thing as "a barrowfu' o' bricks," but so very rarely, that it is not entitled to enter into the estimate of his character and habits. We have also known the Peghler to have the art of thatching houses, and even, on an emergency, when in the last day of his shirt, to sweep a chimney, either for the benefit of himself, or one of his neighbours.

The Peghler is always prosperous, so long as things depend upon his own immediate exertions and sagacity, and while his children are still so young as to be obliged to conform to all his rules. But the unhappy man is almost invariably ruined by his family. He has been all his life a severe disciplinarian. Every Sunday, twice in the day, has he marched his flock of Johnnies and Jennies to Mr Lothian's, in the Vennel, besides having, all his life,

"Morning, nichtly,
On the *questions* targed them tichtly."

But all is as nought when the struggling savages arrive at ripe age. Jockies are then set up as meal-dealers or builders, and Jennies are married to grocers and tanners. The boys carry *higher* heads than their father, but not so *long*, and the sons-in-law (as blood, according to the kindly Scotch adage, is thicker than water) obtain his scratchy, but valuable signature, to bills and other obligations. The gains of wisdom and parsimony are then squandered by folly and self-indulgence. Even while the family is still domiciled with him, he is in danger of having his good old system broken in upon. The youngsters see finer style in the dwellings of their playmates, and they begin to discover that their father is not the poor man he seems. The Peghler is thunderstruck, some fine morning, at finding his household convulsed by a general rebellion, to which the very wife of his bosom is evidently not ill-affected, against further breakfasts of porridge. The ancient dynasty [*quasi dicitur* dine-asty] of potatoes is tumbled from its throne; and tea, hitherto a thing only enjoyed clandestinely when he was from home, sets up its unblushing front every evening, as if it had a title of a thousand years' standing. It is in vain that he struggles against these innovations. He is brought to submission, like Gulliver among the Lilliputians, by the very multitude of his enemies. He might seize a Jock or a Jenny, as Gulliver could have done by half a score of his minute foes, but whatever punishment he could inflict would be revenged twenty-fold by the myriad shafts of ridicule, and remonstrance, and complaint, which would have instantly been directed against him. At length the poor Peghler, after a manful resistance, is obliged to give in with a good grace; and TEA, the arch-fiend of his former dreams, reigns supreme.

From such causes as these the Peghler often ends where he commenced—a very poor man; but yet the case is often far otherwise. Perhaps his eldest son is reared a baker. The youth is steady and active. The moment he is out of his apprenticeship, he marries his master's daughter, and the two swarm off to set up in some new street, about the outskirts of the New Town. Little stock is required to set up a baker. Two pounds buy a bag of flour, and no more is required to begin with. The wife is established in a small back room, with a window of two panes looking into the front shop; and there she sits, looking through her loop-hole of retreat on the world that passes by, unless when called upon to attend to her customers. In the evenings, if you happen to drop in to buy any thing for your children, you get a peep through that loop-hole, unless it be altogether covered by its curtain of green baize, of such a comfortable tea-table as makes you envy the happy lot of the son of the Peghler. Or perhaps the honest baker himself appears in his door, with his red cowl pushed back from his brow, and is engaged in discussing, amidst a crowd of neighbours, some knotty subject that has just been started by the Scotsman or the Chronicle. He is redolent of warm toast, and his wife is just washing the "tea things" in the back-room. His broad hearty laugh, the expression of a mind at ease with itself, and happy with all around it, is heard occasionally over the debate; and if a customer chances to enter, the transaction is in general so simple, that it does not interrupt his argument, but he continues speaking to his friends at the door, from the far recesses of the shop, till he is enabled, by the conclusion of the business, to resume his station in the threshold. The Peghler watches and rejoices over the good behaviour of this worthy son, with a gratulation of spirit inconceivably great. He loves the children (for bakers always have lots of children) far better than do their father or mother; and they, in their turn, would not give their grandfather for twenty of their more immediate parents. As they sit on his knee, they ask him innumerable questions about his watch, and its many chains, and its seal, and its sixpence, and its little shell; and occasionally, when they are "gude bairns," he will even allow them to see the inside of the wonderful machine. They entertain a most reverential respect for a particular pocket in his large spotted woollen vest, in which they know he keeps halfpence. That pocket seems to them the most estimable and glorious object in the whole world; and they cannot see him bring his hand so much as near it, without a fluttering tremor of expectation, almost amounting to delirium. Their first breeches have all along been *hanselled* by the Peghler, and indeed every successive pair since; and, in fact, they are so often treated by him in this way, that their ideas of "grandfather" and "halfpence" are inseparable.

And so I leave the Peghler to his repose.

POPULAR INFORMATION ON SCIENCE.

HAIL.

THIS country which we have the good fortune to inhabit is certainly, to a considerable extent, free from those terrible tempests which so frequently lay waste and desolate other regions of the globe. But notwithstanding this, thunder-storms and hail-storms occasionally occur in Britain, which, although of short duration, do much local injury. Before the occurrence of such a storm, all the elements of nature seem disturbed. Birds, as if warned of an impending calamity, seek shelter in forests or in the crevices of rocks. Cattle of all descriptions appear alarmed, and betake themselves to their sheds, or seek protection beneath the branches of trees. The clouds increase in size, and become heavy and black; they appear agitated; are hurried swiftly through the air; and often seem to rush against each other, until at length, as if unable to sustain their burthen any longer, the hail is precipitated with violence to the earth. During this time, darkness thick as night often prevails; thunder is heard to roll along in heavy vollies; the most vivid forked lightning is seen; and the wind, as if striving for the mastery, not unfrequently sweeps along as in a hurricane, tearing down the boughs of trees, and uprooting them from the soil in which they were fixed. At length, after raging some time, the storm abates; the thunder and lightning cease; the wind sinks; the hailstones decrease in size; rain succeeds; the clouds break, and no trace remains of the storm, excepting in the devastation it may have occasioned. Such are the phenomena—often impressive, and amounting to sublimity—which attend the occurrence of violent hail-storms; having premised which, we proceed to consider more particularly the origin and nature of hail.

Hail is unquestionably formed by the congelation of vapour in the higher regions of the atmosphere; and this arises from the warmer air in which the vapour was suspended mixing suddenly with an intensely cold current of air. Hail is generally defined to be frozen rain; but it differs from ice in this, that the hailstones are not formed of single pieces of ice, but of small particles agglutinated together, some of which are very hard, like perfect ice, while others are soft as snow, or resemble snow that has been hardened by frost. When hailstones are broken open, or cut across, they are sometimes within found to be of a spongy structure; sometimes the interior presents a very beautiful radiated appearance, and not unfrequently exhibits regular and very remarkable concentric plates. Generally, the centre of the hailstone is harder than its surface, and occasionally presents us with a nucleus, or sort of core, imbedded in which, bits of straw, wood, and earth, have been found; substances which, it may be presumed, were elevated from the surface of the earth by the action of a whirlwind, or some similar meteor. Hailstones vary much in shape: they are generally oval or round, but sometimes thin, flat, irregularly globular, angular, pyramidal, occasionally irregular, having a central point whence proceed numerous icy spiculæ, like rays in all directions; and, also, although more rarely, they have appeared as six-sided prisms. A few years ago, a tremendous storm occurred in Gloucestershire, the most remarkable circumstance attending which, was the hail-shower by which it was accompanied. "It may be doubted," says the Athenæum, "whether such a name as hail be applicable, for the masses of ice which fell in places where the storm most fiercely raged, bore no resemblance to hailstones in magnitude or formation, most of them being of a very irregular shape, broad, flat, and ragged, and many measuring nine inches in circumference; they appeared like fragments of a vast plate of ice broken into small masses by its descent towards the earth." On the 4th of June, in the year 1814, hail fell at Cincinnati in North America, the pieces of which are described, in the account read to the Literary and Philosophical Society of New York, as having been apparently "aggregated of numerous others, which were likewise composed of smaller ones, while some of more than ordinary size appeared single, as if they had been snowballs immersed in water, and refrozen."

Hailstones vary considerably in size—from that of a nullet seed to that of a pigeon's egg—the smaller generally falling in the more northern climates, the larger in the south of Europe. Hailstones have fallen in Scotland which have been found to weigh five ounces; in North America they have been picked up weighing fifteen ounces; and in October 5, 1831, one fell at Constantinople which weighed more than a pound. "I had long refused," observes Volney, in his View of the Climate, &c. of America, "to credit the existence of those hailstones said to weigh ounces, and even pounds, of which newspapers and travellers too frequently speak. But the storm of the 13th of July 1788 affords me the conviction of my own senses. I was at Ponchartrain, ten miles from Versailles; and going to see a sheep-walk at six o'clock in the morning, I found the rays of the sun intolerably scorching; the air was calm and suffocating, that is, it was extremely rarefied; the sky was without a cloud, yet I heard four or five claps of thunder. About a quarter after seven, a cloud appeared in the south-west, and then a very brisk wind arose. In a few minutes, the cloud filled the horizon, and speeded toward the zenith with an increase of the wind; and a hail-storm suddenly came on, the stones not falling perpendicularly, but at angle of 45°, and so large that you would have taken them for the pieces of mortar of a roof falling down. I could not believe my own eyes; many of the stones were larger than a man's fist, and I observed, too, that several of these were only fragments of larger pieces. When I could safely venture my hand out of the door of the house to which I had very opportunely retired for shelter, I took up one, and found it to weigh more than five ounces by a common pair of scales. Its shape was very irregular, and it had three principal horns as big as the thumb, and almost as long, projecting from the nucleus, on which they were collected. I have been credibly informed that a hailstone at St Germaine's weighed more than three pounds, and after this I know not what surpasses belief."

It is related, that, during the wars of Louis the Twelfth in Italy, in 1510, there was for some time a horrible darkness, after which the clouds broke into thunder and lightning, and there fell hailstones of one hundred pounds weight. Hailstones of such extraordinary magnitude and weight as this are certainly not known in this country; but they have frequently fallen as large as pigeons' eggs, and with a force that has done considerable mischief. On the 19th of May 1809, a severe hail-storm occurred in the neighbourhood of London. The hailstones that fell were many of them a full inch in diameter. Such was the velocity with which they were precipitated, that in many instances a clear round hole was left in the glass they pierced. "The water of the river (says the account), lashed by the hail and raised by the wind, resembled a cauldron boiling violently, rather than waves with breakers. The damage done was so great, that a London newspaper estimated it at 200,000 squares of glass, broken in sashes, skylights, conservatories, oratories, hot-houses, &c., besides the injury done to the crops in fields and gardens. The foliage of large elms was cut off, and scattered on the ground to a furlong's distance to leeward; and fruit trees, besides being thus stript, received wounds in their bark which were visible long after." It is calculated that a single drop of water, the diameter of which is only the one-thousandth of an inch, will, in descending through the air, acquire a velocity of nine or ten feet every second; wherefore it is less surprising that hailstones of such magnitude and weight should occasionally prove destructive, not only to delicate plants, but even to animals; for a pebble, even of the ordinary size of a hailstone, were it to fall from the mouth of a well on the head of a man, would kill him; and meteoric stones, which are no larger, bury themselves deep in the ground, and have been known even to force themselves through the body of a house, and penetrate some inches into the cellar ground. But the truth seems to be, that hailstones, in the progress of their descent, acquire additional magnitude. It is probable that the largest commences its formation with a small nucleus, which receives continual accessions of frozen vapour in its descent to the ground. This accession of vapour is derived from matter in a state of rest, which has to be put into motion by the falling body, which thus, in every stage of its progress, has its own speed retarded. The velocity, therefore, which it would acquire in falling, is overcome or lost by the resistance it meets with in communicating motion to so large a quantity of matter as that which composes its accretions. Accordingly, hailstones are found to be smaller on the tops of mountains than in the neighbouring plains or valleys; because, not falling so far, they do not augment their size by the addition of successive layers of congealed watery vapour.* The force, however, with which hailstones fall to the earth, is often very considerable. In August 1813, a division of British infantry, descending the Pyrenees, was overtaken by a violent hail-shower, which lasted twenty minutes, and created more alarm among its victims than the approaching contest. The hailstones varied in size from that of a bean to that of a hen's egg, and were transparent masses of ice, round in form, with icicles extending from their surface about the length and thickness of the prongs of a common silver fork. "I am induced to believe," says Mr Stewart, who was

* See an excellent Memoir on the Causes and Phenomena of Hail, by Professor Olmsted. Silliman's American Journal, vol. xviii. p. 10, 11

present, "that the hail had been twice as large in the higher regions of the atmosphere and before they reached the surface of the earth, as the stones themselves, and the spiculæ or icicles on their surface, had all the appearance of being partially melted down by heat. Fortunately the troops had their backs to the storm, else many of them must have lost their eyes, and been otherwise maimed from the weight of the stones, and the force with which they fell. I have heard some of the men say their tin kettles were dinged or dimpled by the shower; and I am induced to believe so, from the circumstance of my having been rendered lame for twenty-four hours, by one of them falling on my foot. The rattling of these stones on the canteens and kettles of the men, and their gradually increasing in size, for some time rendered the scene truly alarming, even to those who had been in the daily habit of exposing their lives to the dangers of war." *

Hail-storms occur principally in the temperate regions of the globe; they appear less often between the tropics, and may be almost said to be unknown in the frigid zone, where the only substance which falls resembling hail is described by Captain Scoresby as consisting of "a white porous spherical concretion, of a light snowy texture." The reason assigned for the frequency of hail-storms in temperate climates, is, that the air in these regions is often in a high state of electricity, for which reason the hail-showers are, as we have already observed, so frequently accompanied by thunder and lightning. France, owing probably to its situation between the Alps and Pyrenees, is, especially in its southern districts, liable to the most severe and disastrous hail-storms: indeed, the distress they occasioned was so great, that the attention of scientific men was directed to the phenomena of these storms, for the purpose of their suggesting or devising some means to avert, if possible, the calamities they so frequently occasioned. Accordingly, proceeding on the supposition that these hail-storms were occasioned by the unequal distribution and accumulation of electric fluid in the atmosphere, they proposed drawing off the fluid by means of rods, similar to those by which public buildings are protected from the effects of lightning. The Linnæan Society of Paris, after causing numerous experiments to be instituted, ascertained the efficacy of these hail-rods in protecting the adjacent district from the injuries produced by these storms. In the Annals of that Society, it is stated, that "the hail-road, or *paragrêle*, has for several years occasioned much inquiry on the Continent, and has engaged the particular attention of that Society. In many districts, which were formerly, year after year, devastated by hail, the instrument has been adopted with complete success, while, in neighbouring districts not protected by hail-rods, the crops have been damaged as usual." Furthermore, it has been estimated by this Society, from numerous experiments made in different districts, that "if these hail-rods were established through the whole of France, it would occasion an annual saving to the revenue of fifty millions of francs." A curious and ingenious method of averting the recurrence of these formidable storms, was introduced by the Marquis of Cheviers, a naval officer living on his estate at Vaurenard, who, having recollected to have seen the explosion of guns resorted to at sea for the purpose of dispersing stormy clouds, resolved to attempt a similar method to dissipate hail-storms. For this purpose, he made use of boxes of gunpowder, which he caused to be fired from the heights on the approach of a storm. This had the happiest effects; and by this means he continued, until his death, to preserve his lands from their ravages, while the neighbouring villages were frequently sadly desolated. He consumed annually for this purpose between 200 and 300 lbs. of mining powder. The inhabitants of the neighbouring communes, convinced of the excellence of the practice, adopted it, as did many others, in which we believe this preventive measure is still had recourse to. In the commune of Flewry, they use a mortar, which carries a pound of gunpowder at a charge, and it is generally upon the heights, and before the clouds have had time to accumulate, that they make the explosions.

In this country, hail-showers occur generally during the warmer seasons of the year, and the weather afterwards becomes cooler; they are, however, of rare occurrence during winter, if we except a sprinkling of small opaque grains, which indicate the approach of severer cold, and are found in the morning on the hardened ground or frozen ponds. The account of the devastation occasioned by violent hail-storms, even in Britain, cannot fail to strike with awe the reflecting mind; but it is not to be forgotten, that, while they inflict so much local injury, they are of essential service in equalizing the electrical state of the atmosphere, and in destroying subtile contagious poisons, which generate the most distressing and fatal epidemic diseases. In some European provinces that were visited by the cholera, which excited lately so much alarm among all classes of society, after heavy hail-storms, accompanied by thunder and lightning, the disease entirely disappeared. Thus the apparent evils, and the sorrows which it pleases the inscrutable wisdom of Providence to inflict on us, are often only the mysterious means by which the most beneficent designs become accomplished. In every walk of nature—no matter through what particular path of science we proceed—all the knowledge that human sagacity can reveal tends to establish one great moral axiom, that "all things which we behold are full of blessings." In the beautiful language of Wordsworth,

> "The silver shower, whose reckless burthen weighs
> Too heavily upon the lily's head,
> Still leaves a saving moisture at its root."

* Edinburgh Philosophical Journal, vol. ix. 195.

THE ARETHUSA.

> "Come all ye jolly sailors bold,
> Whose hearts are form'd in honour's mould,
> And I a story will unfold—
> Hurra for the Arethusa!"

THAT was the ship—she was one of the fleetest of the fleet—sailed like a witch, and sat on the water like a duck. Why, she could do any thing but speak, and all her crew had their hearts in their right places:—there was no fumbling for 'em in their hats, or searching 'em out of their pockets when they came into action. No, no; their hearts always beat to quarters, to the tune of "Rule Britannia;" and then their arms were sure to gain the day. The old Harry-thusers were all well known at every sea-port town in the kingdom; and no sooner did the blind fiddlers see any of 'em come into a room, than there was an extra expenditure of rosin and cat-gut upon the old tune. Didn't Lord Exmouth command them (in 1800) when they took the French squadron off Ireland? To be sure he did; though he warn't a lord then; and a pretty day's work they had of it. Howsomever, they gained the day, as most of the Jehus about Plymouth can testify. Five on 'em bought a coach, horses and all, and then hired the coachman for three days to drive about—but all hands kept upon deck, and left the inside empty; for what was the use of skulking under hatches in fine weather? So, d'ye see, they stowed the craft well with grog and 'bacca—got all snug, with a fiddler forward, and an organ-grinder abaft, and carried on between Plymouth and Dock during the whole time they stopped on shore. Ah, them were the days! when a sailor had no trouble in getting rid of his money; but now he can't gather as much as would jingle upon a tomb-stone; and if he does have a sixpence or two, he is obliged to drive it up in a corner of his pocket to catch it!

I can remember coming up from Portsmouth once, on a fortnight's leave; there were seven or eight of us, and among the rest was Jack Transom, of the ould Harry. Well, d'ye see, he'd nearly three hundred pounds prize-money about him, and which way to spend it he didn't know. Seven years had elapsed since his feet had touched the shore, and he was like a wild fellow. Every house he came to, a fresh bucket of licknum-vitæ was mixed for all hands, till he'd thoroughly set up the backstays of his heart, though the laniards had a taut strain on 'em before we made sail. Well, there he stood on the forecastle—on the roof, I mean—shouting "Happy Jack!" flourishing his short stick, and waving his hat, to the great astonishment and terror of the rusty villagers. It was night-time, and Jack would pay for all the passengers' suppers, so he gave the landlord a fivepounder of Abraham Newland's, and told him not to mind change, for he hadn't got room for it. At last he was completely groggy, and when we changed horses at Thing-em-he—I forget the name of the place—he would have another nip at the stuff, which hove him into a stark calm—till the vessel, I mean the coach, got into motion, and then he sprung his luff, and once more took his station standing on the roof, but, being quite tosticated, in a few minutes after we started he got tossed off altogether. Overboard he went, and came down on to the road like a lump of lead.

Coachee rounded in the braces directly, and hove all aback, so that every soul landed to pick him up. "He's gone," says Dick Fiferail; "he's outward bound—Yo-hoy, Jack!" hallooing in his ear enough to split it: "Yo-hoy, shipmate, rouse out, and don't turn in before the hammocks are piped down!" "Blesh ma heart," cried an old Jew agent, "vat a pitysh! Vere's de moneish though?—mush take care of the moneish." "No, no," says the guard; "let his pockets alone; but lend us a hand to carry him back to the house." A young assistant surgeon happened to be stowed in between decks; he felt his pulse, but gave very little hopes, unless they conveyed him instantly to the house. Indeed he thought he had already slept his cable. So they put him inside of the coach, and drove back again. Here he was stretched out upon a table, and the doctor overhauled his timbers, to see if there were any butt-ends started, or any of his precious limbs carried away. Howsomever, all was right, though he gave no signs of returning hangimation.

"Why don't you feel his neck?" says Dick; "mayhap his windpipe may have got a turn in it, and his breath is jammed in the hawse. Yo-hoy, Jack, unmuzzle, my boy, and tell us whether you're dead or dumbfoundered. What's the use of keeping us here? He's gone, your honour," turning to the surgeon, who was preparing to bleed him; "he's gone, poor fellow, and a most foul and unnatural death he has had of it. Give us another glass of grog, landlord; and let it be stiff, d'ye hear. Bad thing that drunkenness, your honour. Put in a little more rum, landlord; but then, d'ye see, what's a sailor to do with his money, unless he makes it liquid? 'Oh, that a man should put an enemy in his mouth to steal away his brains!' My service to you, sir. Ke-keep us all sober, say I. Here, Jack, you loved it alive; but your allowance is stopped now. Howsomever, a small drop won't hurt you"—and so, contrary to every one's persuasions, he poured some into his mouth. Scarcely had he done so, when it produced a gurgling in the throat; and whether it was the smell or taste of the stuff, or the effects of bleeding, but I rather think the former, he opened his eyes, and faintly uttered his usual cry of "Happy Jack!" "There," says Dick; "I knew, if any thing would bring him to, here's the me-dickey-ment—it's a key would open a locked jaw at any time." "Happy Jack!" continued the other, as he sniffed the grog with a gust; "Happy Jack!" Well, d'ye see, his arm was bound up—his money was examined—and Jack was carried up to bed, while all hands returned to the coach, and made sail with a fair wind and a free sheet.

At Godalming we stopped about half an hour, to freshen hawse; and just as we were all comfortably berthed for the next stage, another coach came driving in astern of us, well manned with liberty-boys, and cheering with all their might. As soon as they clapped us alongside at the inn, the first words we clearly distinguished were "Happy Jack!" and sure enough it was he himself, for, after a short nap, he had mounted the next coach, and promised the coachman a guinea if he would carry on and come up with his own ship again. This was accomplished. He boarded us with three cheers, in which all hands heartily joined but not being quite recovered from his fall, they wanted him to get inside. "No, no," says Jack; "I have never been used to a cabin, d'ye mind, and, mayhap, the gemmen and ladies (for we had taken up two ladies at Godalming) wouldn't like such a shipmate: But never mind, I'm Happy Jack; so if so be you can stow me under the forecastle there, all well and good; but if not, why, then, pass the gripes round me, and lash me upon deck."

"Ya, hip," went the coachman, and so we coiled Jack away in the boot, and dashed off to the tune of "Jack's alive," which the guard played upon his bugle like an angel, to the admiration of all on board, except the old lady and Dick, who kept talking occasionally through the open window. It was a delightful summer morning, and the sun shone beautifully on the dewy grass as we passed rapidly along the road, hailing the convoys homeward bound, and now and then catching a distant glimpse of our consort, as he carried on to get up in our wake; but a starn chase is a long chase, so we had only an opportunity of just saying "What cheer? what cheer?" as the coach hove-to to give the horses their water, and the coachman his *wet*. At last, both vehicles arrived at the Elephant and Castle, when "Happy Jack" roused out from his berth, looking very deplorably; for his clothes (a new suit) were torn to pieces, his face bruised, and his whole frame very sore. Howsomever, we hired three hackney-coaches, hoisted a blue jacket, on a barber's pole, for the admiral's flag, and steered boldly over London Bridge, bound for Wapping, where we soon anchored in Blanket Bay, with plenty of rhino, a good supply of grog, and no purser to nip us on short commons. After a good sleep we reckoned our cash, found a great deal gone, particularly Jack's; but still we mustered somewhere about five hundred pound, which was shortly spent like true British tars, to the honour and glory of old England, and the Harry-thusers.*

ANTIPATHIES TO ANIMALS.

MANY men have strange antipathies to animals. Some of these are accountable, as depending upon form; others, profoundly mysterious in the why and the wherefore. All ladies fall into hysterics at the approach of a spider. Snakes are generally objects of fear, rather than antipathy, from the deadly power which some of the species possess; but why a beautiful lizard, a sleek mouse or a rat, should be objects of antipathy, it is difficult to conjecture: elegant in form and harmless, they might at least be looked upon with complacency. The sight of a rat has been known to throw even the male sex into convulsions. Claude Prosper Juliot de Crebillon, a name conspicuous in the annals of French literature, was confined in the Bastile, in pursuance of the caprices of one of the old Bourbon satraps, who often shut up in dungeons the men of the age most conspicuous for talent, and who were known to promulgate unsavoury truths. One night, Crebillon felt what he thought to be a cat reposing by his side in bed: glad of such a companion in that silent mansion, where to many a prisoner "hope never came," he stretched out his hand to caress it; but it ran away. The following day, when seated at his dinner, he saw, through the "darkness visible" of his cell, an animal squatted, *vis-a-vis*, on his table, and was soon able to perceive that it had a long slender tail, and was not a cat, which at first he imagined it to be, but an enormous rat. He had an unconquerable antipathy to rats; and, springing from his seat, cried aloud with terror, and overturned his table; the noise brought in a turnkey, who found him

pale, and nearly senseless; and it was a long time ere he recovered himself. This animal had been the companion of a preceding prisoner, who had tamed it; and so well did the horrible solitude of the Bastile operate in removing the antipathy of Crebillon to these creatures, that at length he became reconciled to its company, and even shared his provisions with it. The case of Crebillon may serve as a useful hint for effecting the cure of most other antipathies to animals.

Many men have also strange antipathies to cats; and so strongly does the sight of them affect some individuals, that their whole frame becomes agitated. A striking instance of this kind came within our own personal knowledge. The late Captain Logan, of Knockshinnock, in Ayrshire, had such an unconquerable aversion to all cats, that he would not remain in the room with one on any account whatever. We have known ladies to expostulate with him on the affectionate and harmless dispositions of their grimalkins, vowing that they would touch nothing larger than a rat; but their eloquence was invariably lost on the captain, who lent a deaf ear to all their pleadings.

He could detect immediately the presence of a cat from smell, even although he could not possibly see it in the room, being under a sofa, or some such place; and he uniformly insisted on its being turned out of the room, before he would compose himself to enter into conversation.

On one occasion, while his regiment was stationed in Tynemouth, we happened to accompany the captain to pay a visit to the family of General R——. We found several visitors in the house besides the family. Among the rest was the late Sir C—— G——, then commanding the northern district of England, and some officers of his staff. When deeply engaged in a political conversation on the events of the times, the domestic cat, a frolicsome young animal, came scampering into the room, when the gallant captain started from his seat, and mounted a chair with all possible alacrity, to the no small astonishment of all present, as none of them were aware of his dread of cats. Every body supposed the captain had been seized with a sudden fit of lunacy; the ladies bounced up, several made their way towards the door, and even the two patriot generals and the staff-officers seemed to entertain doubts as to their personal safety; and, in particular, we noticed Sir C—— G—— keeping an attentive watch on the handle of the captain's sword. In short, every countenance but our own bore marks of anxiety, and we laughed outright, to the no small displeasure of the general's lady, who thought it no joke, and entreated us to pacify our friend.

We must mention, that Captain Logan was then a man of about thirty years of age, six feet one inch in height, and of a very athletic form; so, to be subjected to the grasp of such an individual was no joke, as the general's lady expressed herself; but as we knew the poor captain was quite *compos* and harmless, we enjoyed the joke amazingly. The old general entreated of him to come down, while the captain obstinately refused until puss was dismissed. The general in vain tried to convince him of her innocent intentions, which increased the convictions of all present that the captain was cracked. By this time all the ladies had made good their retreat, and some of the younger ones stood peeping in at the door, with the handle in their hand, in case of the captain trying to follow them. Things beginning to assume a serious aspect, we lifted puss, and rung the bell for a servant to remove it out of the room, after which the captain descended, and in a few minutes resumed his wonted coolness. An explanation followed, and this irresistible infirmity of the captain's was felt, by those who witnessed the ludicrous scene, more with pity than contempt; and we will venture to say, that such was the impression which was made at the time, that none who witnessed it will ever forget the scene.

The inhabitants of Britain, in the mass, are haters of toads and frogs; while it is well known that in France there is a species of the latter animal which is considered a delicate article of food; thus verifying the old proverb, that "what is one man's meat, is another's poison."

There are not in nature two more harmless animals than the toad and frog; the idea which generally prevails, that the former is poisonous, is all a fable; and a dread of these creatures is instilled into us by the folly of nursery-maids, who hand it down with great care from one generation to another. There have been various instances of individuals making pets of these animals, and they have been rewarded for their attentions by watching the singular manner in which they take their food, and prey upon insects and worms, and also from some curious experiments which have been tried with them.

The tree-frog, which is a native of America, France, Germany, and Italy, and many other European states, has been kept by Dr Townson, who had them in a window, and appropriated to their use a bowl of water, in which they lived. They grew quite tame; and to two which he had in his possession for a considerable time, and were particular favourites, the doctor gave the names of Damon and Musidora. In the evening, they seldom failed to go into the water, unless the weather was cold and damp; in which case they would sometimes abstain from entering it for a couple of days. When they came out of the water, if a few drops were thrown upon the board, they always applied their bodies as close to it as they could; and from this absorption through the skin, though they were flaccid before, they soon again appeared plump. A tree-frog, that had not been in the water during the night, was weighed, and then immersed; after it had remained half an hour in the bowl, it came out, and was found to have absorbed nearly half its own weight of water. From other experiments, it was discovered that these animals frequently absorbed nearly their whole weight of water, and that, as was clearly proved, by the under surface only of the body. They will even absorb water from wetted bloating paper. Sometimes they will eject water with considerable force from their bodies, to the quantity of a fourth part, or more, of their weight. Before the flies had disappeared in the autumn, the doctor collected for his favourite tree-frog, Musidora, a great quantity as winter provision: when he laid any of them before her, she took no notice of them; but the moment he moved them with his breath, she sprang upon and ate them. Once, when flies were scarce, the doctor cut some flesh of a tortoise into small pieces, and moved them by the same means; she seized them, but the instant afterwards rejected them from her tongue. After he had obtained her confidence, she ate from his fingers dead as well as living flies. Frogs will leap at the moving of any small object; and, like toads, they will also soon become sufficiently familiar to sit on the hand, and submit to be carried from one side of a room to the other, to catch flies as they settle on the wall. This gentleman, accordingly, made them his guards at Gottingen, for keeping the flies from his dessert of fruit, and they performed their task highly to his satisfaction. He has seen the small tree-frog eat humble-bees, but this was never done without some contest. They are in general obliged to reject them, being incommoded by their stings and hairy roughness; but in each attempt the bee is farther covered with the viscid matter from the frog's tongue, and, when thus coated, it is swallowed with facility.

THE WESTMINSTER TOBACCO-BOX.

It is, indeed, a pleasing truth—the people of London must eat their dinners, and, what is more, smoke their pipe and enjoy their measure of porter every day in their lives; so we need not have the smallest dread of a revolution in that quarter. But if all chance of the commission of an "overt act" is thus happily avoided, there can be no harm, surely, in talking of what *might* be done. We have often remarked, that a great deal of good is done by talking. The reverse, we are aware, is alleged; but we know better. Nothing like a free unlimited talk over our wrongs; nothing like each man telling his neighbour what he thinks of the state of things. It allows a free vent to our sufferings; and if we do not reap any practical benefit thereby, we at least think so, and that is quite enough. Now, a large proportion of the male population of London could not exist without their nightly talk. That talk they must and will have, in spite of all other arrangements to the contrary. Leaving their places of business as night begins to draw its sombre curtain over the world of streets and houses, they wend their way to their rendezvous or club—no, not exactly a club either; something between a regular club and a casual meeting; every thing understood; dropping in, as if by accident, all in an easy friendly way; the meeting being ordinarily constituted by the first whiff of a pipe, much in the same manner as an engagement commences by the firing of an advanced guard. The talk, after this, is carried on through the smoke.

London is not what it has been in the way of clubs. There was a time when they were to be found of every description and grade, and when the caustic wit of Goldsmith was applied in illustration of their humours and follies. There are not many of these ancient fraternities now existing in vigour, the ordinary means of recreation having diverted attention from them, and ruined their prospects. Of those which do hold out against the encroachments of modern manners, none are so worthy of notice as one entitled "The Past Overseers' Society of the Parishes of Saint Margaret and Saint John the Evangelist, Westminster." This association of past overseers of the poor has been greatly indebted for its prolonged popular existence to rather a singular object, namely, a *tobacco-box*, at once the standing subject of talk and bond of amity of the club. The history of this box is exceedingly curious, and affords an excellent commentary on the profuse dispensation of wealth on trifles, in the artificial state of society which exists within the bills of mortality.

This wonderful tobacco-box, which, in the present day, is both an object of antiquarian curiosity and an article of considerable intrinsic value, was originally a common flat horn box, of a portable size for the pocket, and bought, as tradition reports, at Horn Fair, for the trifling sum of fourpence. Its original possessor was a Mr Henry Monck, who usually brought with him to the tavern where those persons, who, like himself, had served the office of overseer, occasionally met to talk over and confer together upon parochial matters, and smoke their pipes in friendly intercourse; all of which persons subsequently formed themselves into the above-mentioned society. Well, what did Mr Monck do, but present the club, in the year 1713, with his well-known tobacco-box, for the general use of the members, who, out of respect to the donor, ornamented it with a silver rim, on which his name was engraved. It was then committed to the custody of the senior overseer for the time being, who transmitted it to his successor, with some additional silver ornament; and this example being followed, with little intermission, for a period of 111 years, a new outer case being always prepared whenever farther space was required for ornament, the box has increased to the bulk of a small tea-chest, and assumed a consequent importance. In short, the tobacco-box of the parish of St Margaret and St John the Evangelist, is now one of the greatest curiosities to be found west of Temple Bar.

The ornaments of the box, which have been contributed as we mention, consist of plates of silver, on which emblematical devices and representations of the memorable events of each succeeding year in the history of this country, with appropriate inscriptions, and portraits of many eminent persons who have borne a conspicuous part in those events, are either embossed or engraved; so that the box, taken as a whole, may be said to contain a memorial of some of the most remarkable occurrences relating to the history of Great Britain during the last century. But this is not all. So important has the box been considered, that a folio volume has actually been published, detailing its history, and illustrating, by a series of highly-finished engravings, executed by an eminent artist, the devices on the plates, and the gradual *growth* of the box itself, up to its present huge size.* Sure such a box was never before heard of, either in heathen mythological lore, or the records of a Christian parish.

We now turn over the leaves of this tobacco-inspired volume. The first picture we find represents the top of the original box, on which are engraved the arms of Westminster, with surrounding ornaments, with a view of the inside of the lid, exhibiting a bust of William Duke of Cumberland, surmounted by the figure of Fame, sounding on a trumpet, as we suppose, the cruelties he practised after the battle of Culloden. At the base of the pedestal lie bound two human figures, as if prepared for sacrifice; one of them a miserable Highlander, with a broken claymore at his feet; the other an old wigged gentleman, probably designed for Lord Lovat. Turning from this dismal memorial, which, however, was the work of Hogarth, we come to the second plate, exhibiting the bottom of the box, on which is engraved a figure emblematic of Charity, surrounded with finely chased ornaments. This plate also shows a handsome tobacco-stopper of mother-of-pearl, with silver chain; also a profile of the box. The box being now completely covered with ornaments, a case is next provided, whereon to display the taste of the overseers. The third plate represents the top and inside of this case. The top is the representation of the fire-works exhibited in St James's Park on occasion of the peace of Aix-la-Chapelle, 1749; the inside shows the engagement which took place between the English and French fleets off Ushant, on the 12th of July 1778—the former commanded by Admiral Keppel, the latter by Count d'Orvilliers; below this sea-fight is the scene of the court-martial, held at the instance of Sir Hugh Palliser, the rear-admiral, on the conduct of Admiral Keppel in that action, by which he was most honourably acquitted. The fourth plate shows the inside bottom of the case, with the portrait of the notorious John Wilkes, with the date 1767. Plates five and six exhibit a projection of the rim, or body of the case, which appears beautifully ornamented in silver work, and comprises the names of a number of the overseers.

The next, or seventh plate, represents the box in a new stage. It has now got another case of a size larger than the former. On the top of this second case is the picture of a meeting of the governors and directors of the poor, assembled in the board-room administering relief. There is a fine air of the last century about the scene here represented. The figures are in old-fashioned dresses, with cocked hats, wigs, and queues, large silver buckles in the shoes, and dressed frills at the wrists. The date below is 1783, and the names of the churchwardens for the time—now at their place of rest in the hallowed precincts of St Margaret's—are neatly inscribed round the edge. The eighth plate, which succeeds, is one of the finest of the whole. It depicts the inside, top, and bottom of the second case. On the former is a well-executed small picture, representing the altar-piece of St Margaret's Church, being the Supper at Emmaus, in *basso-relievo*, by Alkin, from a painting by Titian; the bottom exhibits St John the Evangelist in the wilderness, approached by an eagle; below is a view of St Margaret's Church, and the date 1789. The ninth plate is of the outside bottom of the second case, and contains a plain gold medallion of the head of George the Third, with an inscription commemorating the general illumination on the restoration of his health. Plate ten and eleven is the projection of the rim or body of the

* This ingenious and certainly curious work, from which these facts are gleaned, bears as its imprint—"London: Printed and Published by I. Clark, 27, Dartmouth Street, Westminster, 1824." We have a strong suspicion that Mr Clark must be a past overseer of St Margaret and St John the Evangelist; and, therefore, so far inspired with the pious and patriotic design of furnishing the world with a pictorial history and description of the great heir-loom of the parish.

second case, which appears covered with rich ornamental chasings in silver.

The box now assumes a new aspect. A third case is added, and, from being round or oval, it becomes octagonal in shape. On the top of this third case is represented the figure of Justice trampling on Fraud, with Westminster Abbey and St Margaret's Church in the background. This scene, being emblematic of a singular incident in the history of the box, deserves particular notice. At one of the meetings of the society in the spring of the year 1793, when it was the duty of the ex-overseer to deliver the box and its appurtenances, he refused to give up his charge, and stated, as a reason for such conduct, that the vestry had refused to pass his accounts, and pay the balance alleged to be due to him, and threatened the society with the entire destruction of this valuable deposit, if they should attempt to compel its restoration. Persisting in his refusal, an action was brought against him for recovery of the box. A bill in Chancery being filed against him, on the 5th of March 1796 the cause came on before Lord Chancellor Loughborough, who, after having heard the arguments of counsel on both sides, decreed that the box and cases should be restored to the plaintiffs. This interesting action at law is delineated in the fourteenth plate, by a view of the Court of Chancery, with the inscription above, in the words of the Chancellor, "Restore the Box to the Past Overseers' Society."

The next plate that interests us is No. 16, showing the bottom of the third case, on which is drawn a naval engagement between his Majesty's ship St Fiorenzo, of 36 guns, and the French frigate La Piedmontaise, of 50 guns, on 6th, 7th, and 8th of March 1808. In this warm and protracted contest, the British, *as usual*, were victorious. Plate 17 commemorates the battle of the Nile, and conquest of Egypt, with the inscription, "The United Kingdom at peace with all the world, 1802." Below is the figure of Plenty pouring the contents of her Cornucopia into the lap of Britannia. Plate 18 exhibits two octagonal divisions, and is a great effort; here is represented a view of Charing Cross, the Duke of Northumberland's house in the background, and, in front, the heralds and attendants proclaiming the peace of 1802; also, a view of the interior of Westminster Hall, at the time the St Margaret and St John's volunteers are attending divine service at the drum-head: the clap-trap in this device is admirable. Plate 19 shows the China fleet repulsing the French squadron in 1801; also a portrait of Lord Nelson, with appropriate emblems, indicating the national grief at his death. The plates which follow are all commemorative of distinguished characters, or national events. We have the portraits of Pitt and Fox; a view of Westminster Abbey, on the occasion of the jubilee in 1809; figures emblematic of the characters of the deceased George the Third, and Duke of Kent; the coronation of George the Fourth; the bombardment of Algiers by Lord Exmouth; the battle of Waterloo; portraits of the Princess Charlotte and her Majesty Queen Caroline; the visit of George the Fourth to Scotland, in which his Majesty is dressed in the garb, and possesses all the air of a Highland porter; the interior of the House of Peers during the trial of the Queen, and portrait of the Duke of Wellington. Lastly, in Plate 34 we have a view of the bottom of the outside case of the box, delineating the anniversary meeting of the society, with the churchwarden giving the "charge" previous to delivering the box to the succeeding overseer: Date, 1824.

The ceremony which attends the annual transmission of the box and cases from one overseer to another, testifies, in the strongest manner, the solicitude of the society for the preservation of this famous tobacco-box. This ceremony takes place after dinner (for, as we observed once before, no public business can be transacted in England without a dinner), at the general meeting which is held upon the appointment of the new overseers. At this, as well as all other meetings of the society, the senior churchwarden of St Margaret's parish presides, who, after having proposed some of the usual toasts, demands the restoration of the box and its appurtenances. This demand having been complied with, the secretary proceeds to examine and report whether they are in as good state as when delivered, whether any ornament has been added, and whether the original box contains the proper quantity of tobacco. If the report be satisfactory, the box is then placed before the chairman, who proposes for a toast, "The late overseers of the poor, with thanks to them for their care of the box and the additional ornament." The CHARGE is then made to the new custodier as follows:—"This box, and the several cases, are the property of the Past Overseers' Society, and delivered into your custody and care, *upon condition* that they are produced at all parochial entertainments which you shall be invited to, or have a right to attend, and shall contain three pipes of tobacco at the least, under the penalty of six bottles of claret. And also, upon *further condition* that you shall restore the box, with the several cases belonging to it, to the society in as good state as the same now are, with some additional ornament, at the next meeting thereof, after you shall go out of office, or sooner if demanded, *under the penalty of two hundred guineas.*" The chairman then proposes as a toast, "the new overseers," wishing them health to go through their office, which well-meaning toast concludes the ceremony.

Kind reader, you have now had an account of a tobacco-box, perhaps the most wonderful of its kind in existence, and of which you could have no previous conception. Altogether, such a remarkable object is calculated to create a deep impression on our minds, of the exceeding artificiality of life in and about the metropolis, as well as of the profuse dispensation of wealth on objects intrinsically of no value, and which are only esteemed for their antiquity, or the association of ideas connected with their history. But why need we moralize on the subject? Fare thee well, thou hale and hearty old club of Past Overseers. Long may your members smoke their pipes of an evening in the back parlour of the Swan, in Bridge Street, and drink in substantial stout, or some other pleasing and constitutional tipple, success and increase to the ancient tobacco-box of the parish of St Margaret and St John the Evangelist.

DREAMS.

A CONSIDERATION that weighs strongly with many people in making them attach credit to the supernatural origin of dreams, is their being repeated more than once. "Idle fantasies," such people acknowledge, "do frequently haunt our slumbers; but they pass rapidly, and are succeeded by others equally vain and equally fleeting. It is a different case, however, when a series of well-defined impressions is not only presented once to the mind, but, as if to make sure of producing an effect, visits our sleep twice, and even a third time. This recurrence of dreams certainly cannot be casual, but plainly indicates that they are sent by some guardian power, with a design to convey some useful warning." To this it may be replied, that any thought which dwells with peculiar weight on the mind returns to it with proportionate frequency. If we dread the occurrence of some event, our fears, banished at intervals, perpetually re-assert their sway. We do not ascribe this to any supernatural interposition: it is nothing but the operation of the mental constitution proper to our nature. Let us suppose that a friend should address us thus: "I am certain of making my fortune now in a very short period—I have been assured of the fact in a miraculous manner." To the question, "How?" his reply is, "How! why I have *hoped* it three times to-day, to be sure; and, though, if the idea had only struck me once, it must, of course, have been acknowledged to have come in the ordinary train of association, yet, having presented itself again and again, it cannot be denied that it springs from some being of a higher order, and conveys an intimation that may be confidently relied upon." What should we think of this augury? And yet it may truly be said to be more rational than that afforded by the repetition of dreams. These being for the most part of the same contexture with our waking thoughts, impress us vividly in proportion to the vividness of the hopes or fears to which they relate, and recur in the same manner, and for the same reasons, as our reflections by day.

> "At dead of night imperial reason sleeps,
> And Fancy with her train loose revels keeps;
> Then airy phantoms a mixed scene display
> Of what we heard, or saw, or wish'd, by day—
> For memory those images retains
> Which passion formed; and still the strongest reigns."

This view of the subject will, however, be more fully unfolded, as well as more pleasingly, to the reader, by attending to a few examples, which, that it may not be supposed they are related in a manner to suit our own particular theory, we take, as they are reported by other writers. In the following instance it will be seen that the dream was not only repeated, but it was repeated a certain number of times. It was related in a letter to the Editor of Blackwood's Magazine in 1826:—

"Being in company the other day, when the conversation turned upon dreams, I related one, which, as it happened to my own father, I can answer for the perfect truth of it. About the year 1731, my father, Joseph D'Acre, Esq. of Kirklinton, in the county of Cumberland, came to Edinburgh to attend the classes, having the advantage of an uncle in the regiment then in the Castle, and remained under the protection of his uncle and aunt, Major and Mrs Griffiths, during the winter. When spring arrived, Mr D'Acre and three or four young gentlemen from England (his intimates) made parties to visit all the neighbouring places about Edinburgh—Roslin, Arthur's Seat, Craigmillar, &c. &c. Coming home one evening from some of those places, Mr D'Acre said, 'We have made a party to go a-fishing to Inchkeith to-morrow, if the morning is fine, and have bespoke our boat; we shall be off at six.' No objection being made, they separated for the night.

"Mrs Griffiths had not been long asleep till she screamed out in the most violent, agitated manner, 'The boat is sinking; save, oh save them!' The Major awakened her, and said, 'Were you uneasy about the fishing party?' 'Oh no,' she said, 'I had not once thought of it.' She then composed herself, and soon fell asleep again. In about another hour, she cried out, in a dreadful fright, 'I see the boat is going down.' The Major again awoke her, and she said, 'It has been owing to the other dream I had; for I feel no uneasiness about it.' After some conversation, they both fell sound asleep; but no rest could be obtained for her. In the most extreme agony she again screamed, 'They are gone, the boat is sunk!' When the Major awakened her, she said, 'Now I cannot rest; Mr D'Acre must not go; for I feel, should he go, I would be miserable till his return: the thoughts of it would almost kill me.'

"She instantly arose, threw on her wrapping gown, went to his bed-side, for his room was next their own, and with great difficulty she got his promise to remain at home. 'But what am I to say to my young friends, whom I was to meet at Leith at six o'clock?' 'With great truth you may say your aunt is ill, for I am so at present. Consider you are an only son, under our protection; and should any thing happen to you, it would be my death.' Mr D'Acre immediately wrote a note to his friends, saying he was prevented joining them, and sent his servant with it to Leith. The morning came in most beautifully, and continued so till three o'clock, when a violent storm arose, and in an instant the boat and all that were in it went to the bottom, and were never more heard of, nor was any part of it ever seen.

"I often heard the story from my father, who always added, 'It has not made me superstitious; but with awful gratitude I never can forget, my life, by Providence, was saved by a dream."

The above dream of Mrs Griffiths is one easily accounted for. The young man was an only son, under her charge, and about to make an excursion upon the water—a circumstance than which nothing is more likely to excite alarm in the mind of a lady, when those in whom she takes a deep interest are concerned. The possibility of some accident was almost sure to alarm her, and it was very natural that the idea of danger should return in her sleep. It was, however, with a degree of indistinctness frequently observable in dreams; for though she had the idea of a boat sinking, it was not connected with the fishing party in which her young friend was about to engage. At first she was no doubt ashamed to yield to the influence of imaginary terror; and it was not till the same vision had disturbed her for the third time, that she gave way to her fears, and acknowledged that she could not rest till she had dissuaded Mr D'Acre from his intended excursion.

There is nothing unaccountable in her having the same dream three times. If we allow that any circumstance which takes a strong hold upon the mind is likely to present itself, though frequently not in a distinct shape, in our sleep, why should it not do so more than once? and if twice, why not thrice? The reason why dreams are not commonly repeated beyond this number of times, we shall see presently. From the times of antiquity, it has been a tenet of superstition universally received, that "luck lies in odd numbers," and the number three was peculiarly hallowed in heathen mythology. "Jove's thunderbolts were three-forked," says the Delphin commentator on Virgil. "Neptune's sceptre was three-pronged; Pluto's watch-dog had three heads; there were three Fates—three Furies; the same god was known under the three names, Apollo, Sol, and Liber; Diana is called the three-faced virgin, because she was Diana upon earth, Luna in heaven, and Hecate in the infernal regions, and was worshipped in places where three roads met." Nothing is more familiar to every schoolboy than all these instances of the mystic virtues supposed to be lodged in this number. The same superstition has descended to our own times, nay, it has been incorporated into our very language, and we speak of being thrice-happy or thrice-wretched, in order to express the utmost intensity of felicity or misery. At times, when the mind is cool and collected, no one acknowledges that any uncommon efficacy resides in one number more than another; but when the mind is excited, impulse and habit rule every thing; and in the case of a dream, which, in itself, most people are disposed to look upon in some sort as a preternatural visitation, its occurring a third time is an accessory circumstance calculated to produce a still stronger belief that we have been under the influence of some unseen power. The person, therefore, who has dreamed three times, commonly acts upon the warning supposed to be thus conveyed, as Mrs Griffiths did in the instance before us; and having taken some step to relieve the mind of the anxiety pressing upon it, the sleep is no longer haunted by recurring fears. If some persuasion of the mystic nature of a thrice-dreamed dream had not prompted Mrs Griffiths to proceed to the bedside of her young ward, and obtain his promise to remain at home—if, without doing this, she had again composed herself to sleep, it is almost certain that she would have had the same dream a fourth time, and so on to other repetitions, until the fantasy exhausted itself, and the power of sleep effectually overpowered her.

But, farther: This dream affords an opportunity of accounting, not only for its having been repeated till a third time, but for its having been repeated at all. If Mrs Griffiths had not been awakened by her husband, the dream might have spent itself on its first occurrence, and left her afterwards to undisturbed repose. We all know how often the most appalling scenes conjured up in our sleep are superseded by others which are incongruous or absurd. Napoleon declared, that, in our waking moments, there is but one step between the sublime and the ridiculous; and the distance between them is certainly not greater

when the mind escapes from the control of reason, and runs riot in a dream. When it is visited in sleep by some strong excitement—and if the excitement is not so strong as to cause us to utter a cry that rouses us, or that makes another rouse us—it commonly passes to some excitement less strong, probably of a different kind altogether, and so by degrees settles back into a state of quiescence. But if we are disturbed at the moment when the tremor of the nerves is at its height, and, by this means, a new and visionary terror is added to the originally vivid impression which occasioned the dream, it is almost inevitable that when the senses are again lulled, but not in complete forgetfulness, the same horrors should resume their sway.

Thus we see a feasible reason both why Mrs Griffiths's dream should have been repeated up to a certain point, and why it should not have been repeated beyond that point. In all likelihood Mr D'Acre satisfied himself with some explanation of this kind; for though he never forgot, that, in every human probability, his life was saved by a dream, yet it did not make him superstitious.

This reasoning will be still more satisfactory when we take the case of a dream repeated twice, and find that the habits of thought of the individual to whom it happened, naturally prevented the vision from visiting his pillow beyond the second time. His ideas immediately reverted to the Scriptural dreams, where it is said of Pharaoh's, "For that the dream was doubled unto Pharaoh twice, it is because the thing is established by God, and God will shortly bring it to pass." Fixing upon this single point of resemblance, which was nevertheless wholly immaterial, he satisfied himself that his own vision was equally the suggestion of divine intelligence, and fraught with equal meaning; and his mind being settled in that persuasion, and his resolution taken in consequence of it, he was not again disturbed by the terrors that had previously haunted his slumbers. The dreamer was the Rev. William Veitch, who, in his own Memoirs, tells us, that having come to the town of Berwick in the time of the persecution, and being himself obnoxious to the government, he had great difficulty in avoiding detection, and made several very narrow escapes. He, however, reached the house of Mr Ogle, a friend of his, where he proposed to remain a few days. "Going to bed after this confusion and weariness," proceeds the reverend autobiographer, "and falling asleep, he dreamed that his house at Stanton Hall, more than thirty miles off that place, was all on fire, which made him awake with great consternation and trouble of mind, and think of altering his resolution, and taking his journey home to-morrow morning, wishing it were near rising time, that he might go. But hearing the clock strike two in the morning, and that it was not seasonable to trouble the house till six of the clock, he fell asleep, and dreaming the same over again, and *awaking all in a sweat*, took the doubling of the dream to be a clear call to go home; which next morning he did, making his apology to Mr Ogle, and telling him his dream (which he said was like one of his own maggots), and desiring him to excuse him at the laird and lady's hands. It being a violent frost, and the day short [it was the 23d of December], he could not ride above twenty miles; so that the next day, being Saturday, it was near night ere he got home. About a mile and a half from his own house, as he was going up a lane, he sees two men and three fine horses meeting him; the foremost of whom, when he perceived who it was, came riding fast up to him (it was Torwoodlee's man), saying, 'O sir, you are long looked for at your house;' which made him ask 'What is the matter? is my wife and family well?' 'Yes,' says he; 'but there is a stranger longs to see you, viz. Argyle; and your wife and he have been sending about the country these two days to find you.' Then he saw that the dream was a clear call to bring him home."

From the remarks with which this dream was introduced, we have seen how it was, that, in the case of Veitch, the dream did not return after the second time, while, in that of Mrs Griffith, it did not produce its effect till the third time. In the case of Rough, formerly noticed in the Journal, the dreamer being clerical, the vision was also doubled, while, in that of Mrs Marten, the more prevalent superstition connected with the number three was found to have exerted its influence.

With regard to Mr Veitch's dream itself, we are tempted to attribute its origin to the agitation of the preceding day:—

> "When choler overflows, then dreams are bred,
> Of flames, and all the family of red."

Nor is it at all improbable, from the fact which he mentions of his "awaking all in a sweat," that his kind hostess, anxious to guard against the discomfort of a cold December night, had loaded him with too liberal a covering of bedclothes. Dr Beattie mentions, that, after a day of hard riding in a high wind, his dreams were of the wildest and most fantastic description, quite of a character with the elemental turmoil with which he had been struggling; and our own acquaintance furnishes us with an example of a youth who conceived himself to be engaged in a contest of snowballs with a ghost. Every pelt he received was felt as peculiary cold; and at last his antagonist, gathering energy from the combat, rushed upon him, seized him by the neck, and sending him headlong with great force, caused him to plough a long and deep furrow in a chilly wreath. He awaked; it was a cold winter night; and he found that the bedclothes had left him bare. The vision of the burning house might very naturally arise from an opposite cause, and when the worthy minister muffled himself up after first awaking, he was taking certain measures to ensure a repetition of the fantasy.

BELL-ROCK LIGHT-HOUSE.

The Bell-Rock Light-House is the most remarkable erection on or near the shores of Great Britain, and, as such, affords a subject of instructive observation to our readers. The east coast of Scotland is penetrated by two arms of the sea, called the Firths of Forth and Tay, both opening upon the German Ocean. The entrance to the Firth of Forth is distinguished by a small island, called the Isle of May, whereon is situated a light-house for the use of mariners. Probably at a very early period, the mouth of the Firth of Tay was similarly characterized by an islet; but it has long since vanished by the action of the tides, and has left no trace of its presence but a sunken reef of rocks, which for ages was exceedingly unsafe to the mariner who approached its dangerous vicinity. At an early period, this sunken reef, which received the name of the Inch Cape Rock, was rendered in some degree safe to vessels, by a bell, attached to it by one of the abbots of the monastery at Arbroath, and which, being rung by the lashing of the waves, warned by its tolling the seamen who approached it after nightfall. It is related by tradition, that the bell so attached by the beneficent abbot was on one occasion wantonly cut away by a pirate who infested the Scottish seas, and that afterwards his vessel, in a stormy night, drifted on the rock, and, as a retribution for his crime, he perished with all his crew. By one version of the story, a Dutchman is said to have been the perpetrator, and that he took the bell out of a sordid desire for the metal; however, his fate is said to have been the same. Mr Southey has caught up the former outline of the transaction, and from it has elaborated one of his most beautiful poetical pieces.

One of the Editors of the present publication, in the work entitled "The Gazetteer of Scotland," has thus described the Bell-Rock as it exists in modern times:—This rock is situated in the German Ocean, about twelve miles in a south-eastern direction from the town of Arbroath, in Forfarshire; about thirty miles in a north-western direction from St Abb's Head, in Berwickshire; in lat. 56° 29′ north, and long. 2° 22′ west. It consists of a reef of shelving rocks of a reddish sandstone, scarcely uncovered at the low water of common tides, but, in spring tides, when the ebbs are greatest, is exposed to a length of 427 feet, by a breadth of 230, with a height of four feet at most. The reef is altogether more than 1000 feet in length. At high water, the whole is covered to a depth of about twelve feet. This rock lies so very much in the way of vessels entering either the Firths of Tay or Forth, or in passing along the east coast of Scotland, that, from a very remote period, it has been the cause of a vast number of wrecks. Till within the last twenty years, such a dangerous rock remained quite undistinguished by any light or signal to scare the mariner from its fatal vicinage. At length a bill was brought into Parliament, 1803, by the Commissioners of the Northern Light-Houses, for the purpose of having a light-house stationed on the rock. On the bill being passed in 1806, they received a loan of L.25,000 from government, to assist an accumulated fund of L.20,000. Plans were laid before them of different kinds, and they adopted that of Mr Rennie, which was on the principles of the Eddystone Light-House. Operations were commenced in the summer of 1807. Stones for the building were collected of different kinds. The outside stones of the first thirty feet were brought from Rubeslaw in Aberdeenshire. Stones for the hearting and for the higher parts were got from Mylnefield quarry, near Dundee. Those on the top were finer, and came from Craigleith, near Edinburgh. At Arbroath a working yard was fitted up for the artificers, and boats were engaged to go to and fro with and for materials, &c. A small vessel was also moored near the rock as a depôt. The most curious part of the work at the outset was the erection of a place of refuge on the reef for the artizans, in the event of an accident befalling any of the attending boats. It consisted of a wooden tower of several stories, fixed on beams of wood planted into the rock, and secured with iron rivets. It was fitted up with sleeping-places, a cooking-room, and a place for a smith's forge. Into this erection the workmen were in the habit of retiring with their tools, as soon as the rock began to be covered with water. The cutting of a site for the foundation was attended with a prodigious deal of trouble, as the tide permitted working for a very short time every day only, and as no work could be done in stormy weather, or in the winter months. Besides, each day the water had to be pumped out of the site, before the men could resume their work where it had been left off. After overcoming almost impossibilities, on the 10th of July 1808 the first stone was laid. In the following spring, the works were proceeded in with much diligence, but not till a great deal of apparatus had been landed and fixed for the heaving of stones, and an iron railway laid along the reef, for the easy transport of materials. During the month of September 1809, the first thirty feet were built. Next season, the works were again resumed, and, by a train of fortunate circumstances, the building was completed in October 1810. In the course o the winter, the internal fittings went forward, and on the 1st of February 1811, the beacon was first lighted. The expense of the whole was about L.60,000.

The Bell-Rock Light-House, thus reared, is a circular edifice, the foundation-stone of which is nearly on a level with the surface of the sea at low water of ordinary spring tides; and, consequently, at high water of these tides, the building is immersed to the height of about fifteen feet. The two first courses of the masonry are very curiously dovetailed and joined with each other, in a way so as to resemble nothing so much as the pieces of a dissected map, forming one connected mass from the centre to the circumference. The successive layers of stone are also attached to each other by joggles of stone. The cement used was a mixture of pozzolano, earth, lime, and sand, in equal proportions. The individual stones weigh from one to two tons. The ground course measures 42 feet in diameter, and the building diminishes to a thickness of 13 feet. The total height is 100 feet, but including the light room, the total height is 115 feet. The building is solid to a height of 30 feet, where the entry door is situate, to which the ascent is by a ladder with wooden steps. Strangers are carried up and down by a chair and crane. At first the walls are seven feet thick, and they diminish to a single foot. From the door-way to the top, there are six flats, each having an apartment; and a communication from one to the other is had by a wooden ladder. The first floor is for holding water, fuel, or other bulky articles; the second for oil-cisterns, glass, and other light-room stores; the third is occupied as a kitchen; the fourth is the bed-room; the fifth the library, or strangers' room; and the upper apartment forms the light-room. The floors are of stone. There are two windows in each of the three lower apartments, but the upper rooms have each four windows. The light-room is of an octagonal figure, measuring twelve feet across, and fifteen feet in height, formed with cast-iron sashes, or window-frames glazed with large plates of polished glass, measuring two feet six inches by two feet three inches, each plate being a quarter of an inch thick. The light-room is covered with a dome roof of copper, terminating in a gilded ball. Round the light-room there is a railed terrace on the outside. The light is from oil, with argand burners placed in the focus of silver-plated reflectors, measuring twenty-four inches over the lips, being hollowed to the parabolic curve. That the light may be distinguished from all others on the coast, the reflectors are ranged upon a frame with four faces or sides, which by a train of machinery is made to revolve upon a perpendicular axis once in six minutes; moreover, by the interposition of coloured glass between the light and the observer, in the course of every revolution two appearances are produced; one is the common bright light, and the other is of a red colour. As a further warning to the mariner, in foggy weather two large bells are tolled day and night by the same train of machinery which moves the lights. The establishment of light-keepers at the Bell-Rock consists of a principal light-keeper, a principal assistant, and two other assistants. They each receive salaries varying from fifty to sixty guineas, with clothes, and board while at the rock. At Arbroath a suite of buildings has been erected, where each keeper has three apartments for his family. Connected with these buildings there is a signal-tower erected, with a telescope, and a set of corresponding signals is arranged and kept up with the light-keepers at the rock. Three of the keepers are always at the light-house, while one is ashore on liberty, whose duty it is for the time to attend the signal-room; and when the weather will admit of the regular removal of the keepers, they are alternately six weeks on the rock, and a fortnight ashore with their families. A cutter of fifty tons burden is kept in constant occupation attending the Bell-Rock, the Isle of May, and Inchkeith light-houses.

The construction of the light-house took place under the direction and by the arrangements of Mr Robert Stevenson, civil engineer, Edinburgh, in a way which did him much honour. In 1824, the same gentleman published "An Account of the Bell-Rock Light-House," with a view of the institution and progress of the Northern Light-Houses, in the form of a splendid quarto volume, which will be of great use in future undertakings of the kind. The Bell-Rock Light-House is now one of the most prominent and serviceable beacons on the Scottish shores, and has been the means of preventing innumerable wrecks. In summer it is occasionally visited by parties of pleasure from Leith and other places, when every attention is shown by the keepers. Though perched in a situation the most awful during commotions of the elements, these men feel no alarm for their safety. In cases of very heavy gales blowing from particular directions, they mention that they feel the fabric yield or tremble a little, but nothing to excite any disquietude. In fine weather at low tides they can walk out upon the reef, and indulge in the amusement of fishing for cod, haddocks, and all the other kinds of white fish of these seas, of which there is here great abundance. They keep an album, in which the names and *impromptus* of visitors are inscribed. On one occasion Sir Walter Scott honoured this Pharos of the

Scottish seas with a visit, and left the following appropriate lines :—

Pharos loquitur.

Far on the bosom of the deep,
O'er those wild shelves my watch I keep:
A ruddy gem of changeful light,
Bound on the dusky brow of night:
The seaman bids my lustre hail,
And scorns to strike his tim'rous sail.

ELEMENTS OF HEALTH.

EXERCISE was always deemed of the greatest importance in the due performance of the bodily functions in the earliest times, as well as necessary to the cure and relief of the numerous diseases to which the frame of man is unfortunately subject. If we examine the works of the ancient and modern authors, we shall find them strongly advocating the benefits arising from corporeal exercises, even from the times of Hippocrates down to the age in which we live, the various species pointed out, and their proper mode of application discussed. Riding on horseback was strongly recommended, as a means of benefiting invalids, by Æsculapius himself, according to the testimony of Galen. The first physician who paid any serious attention to exercise as a remedial agent for the cure of disease, was a Thracian of the name of Herodicus. He was the master of an academy which he denominated *Gymnasia*, where he instructed his pupils in the military and athletic exercises. Having noticed that these employments produced in his students an exceeding good state of health, he turned his attention to their regulation, so as to produce good health in invalids: with this view he established what he named *Medical Gymnastics*. As might be expected, his enthusiasm began to work empirically, inasmuch as he conceived they would benefit, if not cure, almost every disease. His employing of them in severe cases of fever, caused him to be severely censured by Hippocrates, whose able commentator, Galen, left behind several excellent remarks on the performance of the different exercises, and their effects in the alleviation of many important maladies. Galen, especially, recommended the use of the *strigil*, or flesh-brush, which is still very properly advocated at the present day. Hipprocrates, in his work upon diet, recommends the various exercises of wrestling, together with that of the *corycus*, or hanging ball, in favour of which Galen composed a little treatise, which he styled *De Parva Pila* (the little ball), wherein he states that it is an excellent species of exercise, inasmuch as it occupies both the mind and body at the same period. In the discourse upon exercises, which he addressed to Thrasybulus, he very ably and properly discusses the question, as to whether the due preservation of the constitution depended upon the use of medicines, or upon the gymnastic art; at the same time he highly condemns the violent and athletic practices employed in the gymnasium, approving, at the same time, of moderate exercises, and assigning them to the judgment of the physician. In the collections of Oribosius, we find that many of the most illustrious of the Greek authors, and among them Antyllus, have treated of them in a similar manner. Historical records inform us, that the ancient Romans even exceeded the Greeks in their attention to medical gymnastics. Pliny informs us, that, in the time of Pompey, Asclepiades was of opinion that the different modes of exercise, viz., friction, walking, and gestation, were the chief auxiliaries to the physician, more particularly when combined with a proper regulation of diet, together with the employment of the medical exercises, the establishment of public baths, with the construction of hanging beds (which later writers have considered as similar to the cots and hammocks used on board ship); these he deemed as some of the best means of rendering medicine agreeable to his patients; by which means, in addition to his great talent, he procured a justly extensive fame. The Roman authors have handed down to us many examples of the great benefits derived from the proper employment of exercise. From the pages of Suetonius, we find that Germanicus was relieved, and ultimately cured of a species of atrophy which affected his inferior extremities, from the exercise of riding: and the eloquent Cicero, when from debility he was compelled to desist from pleading, recovered his health by travelling, and the employment of friction. The ancient Romans were so well acquainted with the benefits arising from the effects of friction, that they even reduced it to a regular system, and constantly employed it as one of their ordinary exercises.

The common experience of mankind has sufficiently established the importance of exercise in the open air, so that it is hardly necessary to appeal to any reasoning to convince us on this head. We may, however, remark, that the immediate effect produced by bodily exercise is the quickening of the circulation of the blood; the motions and contractions of the heart and arteries become more full and stronger; the consequence is, that the blood becomes more effectually propelled to every part of the system, but more particularly through the extreme ramifications of the arteries; a glow on the surface of the body is immediately produced; the countenance assumes a bright reddish appearance, from the small capillary vessels being distended with scarlet arterial blood; and the exhalent vessels of the skin immediately secrete the perspirable fluid, which they throw out from the surface of the body. The extreme branches of all the other arteries in the body are distended and excited to greater action in a similar manner, whereby the functions of the glands, and other secretory organs, are stimulated to a greater activity in the performance of their various and individual offices. The office of digestion, in consequence of the gastric vessels forming the fluids necessary to digestion, is more actively, and, at the same time, more perfectly completed, and the stomach duly prepared for the repetition of the digestive process, in consequence of the supply of the gastric juice being increased. The bile and pancreatic juice are more speedily elaborated, and thus they increase the powers of the operations performed in the alimentary canal. During this period, when so many of the natural functions are in activity, it is to be borne in mind, that the functions of the lungs are not idle; in fact, they are in equal activity, inasmuch as they are called upon for a greater supply of the vivifying principle, which is derived from the oxygen in the atmosphere by which we are surrounded; and in consequence of the circulation of the blood being increased, so is the function of breathing, in proportion to the quantity of venous blood which the respiratory organs receive from the various parts of the body. Thus we perceive the wisdom of our gracious Creator even in the simple performance of any exercise, as running, for example, which causes the blood to circulate with greater velocity throughout the body; yet, at the same time, in order to prevent our suffering, or being annoyed in consequence, renders all the other organs consonant to it, by the increased actions of the lungs, in conjunction with the organs of exercise, *i. e.* the muscular system.

Now, to the most common observer it must appear plain, that, from the increased activity of the whole system, the uninterrupted circulation of the blood throughout the most minute of its vessels, as also through the glands and other organs, with the prompt separation of the excrementitious and other portions of the vital fluids, by the action of the various secretions, cannot do otherwise than contribute, in a greater or less degree, to the general health of the constitution. Exercise has another great advantage attending it, which is its contribution to the evolution and growth of the different parts of the human frame, whether we consider the great influx of the vital fluids (from which all enlargements of parts are formed), or whether we notice the fact, that those muscles and limbs, in consequence of active exercise, constantly acquire greater bulk, as well as superior strength. Let the reader but witness the arms of blacksmiths, anchorsmiths, watermen, and pugilists; the legs of dancing-masters, or the loins of porters, as also the backs and loins of watermen and firemen. These parts being, from the nature of their various avocations, in frequent and almost daily exercise, are invariably disproportioned in size. We may likewise add, that the same occurs to persons in the habit of elevating or carrying parcels of great weight, as warehousemen, porters, &c. Having noticed the phenomena we have just mentioned, let the reader but contrast them with the thin and almost emaciated forms of literary and sedentary men, and also the enfeebled legs of that ridiculed but useful class of the community, the tailors, whose extremities being but little brought into action, the muscles connected with them are apt to shrink. This fact must be apparent to any of our readers who have been so unfortunate as to have at any time broken an arm or thigh, and having had it bound up in splints and bandages for several weeks, until the bone has firmly and properly united. In a case like this, the contrast is apparent; the arm at liberty, and in the enjoyment of exercise, remains the same; the one bound up loses its size for want of action; but no sooner does it once more regain it, than it speedily assumes its former appearance.

The effects produced by exercise, in affording strength and rigidity of fibre to the fleshy or muscular system are daily, and almost hourly, exemplified in the difference we perceive in the texture of the legs and wings of birds produced on the table as articles of food. In the common barn-door fowls, and other graminivorous birds, which scarcely ever employ their wings for the purpose of flying, but daily use their legs in walking, this non-activity of the one part, and exercise of the other, produces great tenderness of the former, and a hardness or toughness in the muscular fibre of the latter. It is from the great influence that exercise has over the body, that we may attribute its growth and strength. Exercise is indigenous to the animal constitution, inasmuch as we find it constantly taking place in the young of the various species of animated nature.

Having considered the advantages of exercise to the human system, we shall now proceed to point out the manner in which it should be performed so as to prove beneficial. In order to employ it, so as to prevent disease, it should not be too violent, nor continued for too long a time, so as to create excessive fatigue. It is, however, impossible to lay down any set of regulations, by which persons may be governed in this respect, inasmuch as many circumstances concur to prevent this, as the constitution, age, habits, and strength of body, must modify its effects in different individuals. Many nations are at the present day prone to exercises, and some we have enumerated are frequently very properly practised by youths at our public schools. Addison observes, that "the French apply themselves more universally to exercises than any other nation; we seldom see a young gentleman that does not fence, dance, &c." The second class includes those which result from motion which is communicated, as riding on horseback, in a carriage, sailing, swinging, friction, driving a carriage, &c.

Walking appears, on viewing the subject of exercise, to be the most natural one, inasmuch as it is capable of producing all the effects I have detailed, if adapted to the degree and duration of various attendant circumstances. Numberless are the individuals who have been subject to previous hypochondriacal maladies, who, by the proper exercise of walking, particularly in airy and country places, have been not only relieved, but cured: the maladies I allude to are those more or less consequent upon a derangement of the digestive faculties. Those individuals who have been accustomed to sedentary habits, and have in consequence become invalids, should regularly and strenuously pursue this exercise, in order to render it very effectual. When walking is but occasionally or only rarely resorted to, it induces languor, lassitude, and fatigue, and this more so, if the intermissions have been great; consequently it is far more prejudicial than advantageous; but it is to be remembered, that if it was daily pursued, it would soon cease to fatigue. So convinced were the ancient physicians of this circumstance, that one of them, whose name we forget, is stated, by Dr Arbuthnot, to have been "very exact in prescribing the exercises of his patients, ordering some of them to walk *eighty stadia* daily, which is about *nine English miles*;" from the idea, and at the same time a very correct one, that it would contribute to the healthy state of the functions. We must not forget that the animal strength becomes destroyed to a certain extent, or, to use the language of the late Dr Brown, the natural excitability becomes exhausted, through the mental faculties, as well as the exertions of the muscular system; therefore, in order that we may carry with us in our walks, in the search of health, the brooding anxieties and cares arising from our professional avocations—if we attempt to unite our studious habits with the exercise, we not only thwart, but frequently defeat our plan, which is to derive beneficial effects. So incompatible is deep thought with the exertion of the muscular system, that many persons frequently stop in their activity, when their arguments require deep reflection and consideration. Whenever walking is resorted to as a remedy for the relief or cure of disease, it requires great calmness of the mental faculties, and a relaxation from the serious occupations of life.

The more violent active exercises, which none but those enjoying the best of health can perform, and which can only be employed as a preservative from disease, require very few observations from us, except in the way of caution. As many of them, such as jumping, leaping, climbing, &c., are liable to induce ruptures, or a descent of some part of the bowels, the reader should be extremely careful of the extent he allows himself to go to, because many diseases, and the one we have mentioned, not only disable individuals from certain occupations, but occasionally are the means of shortening life.

The modes of exercise which may be safely used in the cure of disease, or the restoration of health in convalescents, are those of the second class, particularly carriage motion, horseback, and sailing. The most gentle exercise is that from the motion of a ship, and, consequently, is well adapted for the relief of persons of infirm and delicate condition of body, and has been frequently resorted to by persons labouring under consumption of the lungs. In the time of Pliny, the ancient Romans were in the habit of sending their consumptive patients into Egypt, not for the purpose of deriving any advantage from that country, but in consequence of the length of the sea voyage. Annæus Gallio, who had been consul, was perfectly cured of consumption from a similar voyage. Celsus was likewise a staunch advocate for sailing as a remedy for this disease; and where the strength of the invalid was unequal to the task of a long voyage, he recommended short voyages, the employment of a litter, and similar means of exercise. Physicians of modern times are in the constant habit of recommending consumptive patients to go to Lisbon, Madeira, Italy, &c. and in the incipient, or early stages, much benefit may be derived, both on account of the climate, as well as in pursuance of the Celsian recommendation, *i. e.* the motion of the vessel. However, invalids too often resort to this remedial agent in the latter stages of the disease, when it is too far advanced to admit of any other than mere palliative relief.

Carriage exercise, and that on horseback, are easily to be obtained, and are, therefore, of more importance in our consideration of the subject. Dr Sydenham believed horse and walking exercises to be of inestimable value, provided they were constantly pursued. Respecting chronic diseases, he observes, "nothing, among all the expedients which have hitherto come to my knowledge, so effectually supports the spirits and strength as long and constant riding upon horseback." And in his Treatise on Gout, and particularly respecting the prevention of the paroxysms by exercise, he says, "riding on horseback is far preferable to all other exercises for this purpose; in truth, I have frequently considered, that, if any person were acquainted with any medicine which he chose to keep a secret, of equal efficacy, in this and most other chronic diseases, with a constant and persevering exercise on horseback, he would speedily accumulate the most ample wealth."

Column for Little Boys and Girls.

I am now going to tell a great number of useful things to my juvenile readers, for I know I have many such. Little boys and girls have, I dare say, a good notion by this time that I am their friend. They will have seen what a lot of capital entertaining stories I have given entirely for their amusement, and that I am never done writing for their benefit. Now, it is always something worth counting on, for you, my young friends, to know that you have somebody that cares about printing things for you to read. How glad would I have been, when a little boy, to have had papers coming in for me to amuse myself with! But nobody cared any thing for the amusements of little boys five-and-twenty years ago. The big people at that time were all so busy with reading stories of battles themselves, and so much occupied setting nations of men to fight against and kill each other, that they just let the children do any way they liked; and then you know boys ran about the streets and threw stones and snowballs at each other, and did a great many other wicked things, quite enough to vex their parents, I assure you. Fathers and mothers are now much more careful of their little boys and girls; and for that you should be very thankful, because you put them to a great expense for clothes and schooling, besides fears for your safety. But, to show your thankfulness, and that you wish to be really good boys and girls, you must take care, above all things, to do what your parents bid you. You know they are never done giving you good advices, and telling you how to behave. Many of you, perhaps, have no father or mother, and that is a great misfortune indeed. I then very much pity your case, for it is seldom that any other body cares for little boys or girls but their parents; and if they be neglected, they go all wrong, and are, most likely, never happy all their days. I will now give you a number of useful and short advices, such as those that good fathers and mothers give, and so you will see all at once how you ought to conduct yourselves.

The chief advice I have to give you is, as I have just said, to do what you are bidden by your parents, or those who take charge of you. Bear with meekness and patience, and without murmuring or sullenness, their reproofs, although you think they are given undeservedly. Never address them but in a respectful manner. Dispute not the correctness of their observations. Never grumble in the smallest degree. If you wish to speak to them, and see them engaged in discourse with company, do not interrupt them, but draw back and leave your business till afterwards. Never make faces, contortions, nor grimaces, while they or any one else are giving you commands. Never take another's chair, if it be vacated for a short time. Never quarrel with your brother and sisters; but live in peace with all. Use respectful and courteous language towards the servants, if there be any, in the family, and never be domineering nor insulting, for it is a mark of ignorance and meanness.*

YOUR CONDUCT AT TABLE.

Come not to table without having your hands and face washed, and your hair combed. Sit not down until your elders are seated. It is unbecoming to take your place first. Offer not to carve for yourself, or to take any thing, though it be something you much desire. Ask not for any thing, but tarry till it be offered to you. Find no fault with any thing that is given you. When you are helped, be not the first to eat. Speak not at table. If others are discoursing, meddle not with the matter; but be silent, except when spoken to. If you wish any thing from the servants, call them softly. Eat not too fast, nor with greedy behaviour. Eat not too much, but moderately. Eat not so slowly as to make others wait for you. Make not a noise with your tongue, mouth, lips, or breath, in eating or drinking. Be sure never to speak with victuals in your mouth. Endeavour so to eat as that none can see your victuals whilst chewing. Stare not in the face of any one, especially your elders, at the table. Grease not your fingers nor tablecloth more than necessity requires. Bite not your bread, but break it; neither crumble it about the tablecloth. Lean not your elbow on the table, nor on the back of your chair. Spit not, cough not, nor blow your nose at the table, if it can be avoided; but if there be necessity, do it aside, and without noise. Take not salt with a greasy knife. Never come to table, if you have a cold, without first clearing your throat and nose. Never raise phlegm into your mouth at table and swallow it: it looks very disgusting. Stuff not your mouth so much as to fill your cheeks; be content with small mouthfuls. Blow not your meat, when too hot; but wait with patience till it be cool. Smell not of your meat, nor put it to your nose; turn not the other side of it upward to view it on your plate. Hold not your knife upright in your hand, but sloping; and lay it down at your right hand, with the blade upon your plate. Spit not forth any thing that is not convenient to be swallowed, such as the stones of plums, cherries, or the like; but with your left hand neatly move them to the side of your plate. Fix not your eye upon the plate of another, nor upon the meat on the table. Lift not up your eyes, nor roll them about while you are drinking. Throw nothing under the table. Bend your body a little downward to your plate, when you move any thing that is carried to your mouth. Look not earnestly on any one that is eating. Gnaw not bones at the table, but clear them with your knife (unless they be very small ones), and hold them not with your whole hand, but with two fingers. Put not a bit in your mouth till the former is swallowed. Before and after you drink, wipe your lips with your towel, if you have one. Never pick your teeth at table; neither pick your nose, nor scratch your head. Never drink till you have quite emptied your mouth, and do not drink often. Frown not nor murmur, if there be any thing at table which your parents or strangers with them eat, whilst none is given to you.

YOUR CONDUCT AT CHURCH.

Decently walk to the pew; run not, nor go playing. When you enter the seat, do not open nor shut the door violently, nor dispute with others who will sit nearest the foot of the pew. Sit where you are directed by your parents. Shift not seats, but continue in the place where you are desired. Talk not in church, especially during service. Fix your eye on the minister; let it not wildly wander to gaze on any other person or thing. Attend diligently to the words of the minister. Pray with him when he prays, at least in your heart; and, while he is preaching, listen attentively, that you may remember.

YOUR CONDUCT IN COMPANY.

Enter not into company without a bow. Put not your hand, in the presence of others, to any part of your body not ordinarily discovered. Sing not nor hum in your mouth, while you are in company. Stand not wriggling with your body hither and thither, but steady and upright. Play not wantonly, like a mimic, with your finger or feet. When you blow your nose, let your handkerchief be used, and make not a noise in so doing. Gnaw not your nails, pick them not, nor bite them with your teeth. In coughing or sneezing, make as little noise as possible. If you cannot avoid yawning, shut your mouth with your hand or handkerchief before it, turning the face aside. Lean not on the chair of a superior standing behind him. Spit not upon the fire, nor sit too wide with your knees at it. Turn not your back to any, but place yourself so that none may be behind you. Read not letters, books, or other writings, in company, unless there be necessity, and you ask leave. Touch not, nor look upon the books or writing of any one, unless the owner invite or desire you. Come not near when another reads a letter or any other paper. Let your countenance be moderately cheerful, neither laughing nor frowning. Laugh not too frequently, but silently smile, upon proper occasion. Stand not before superiors with your hands in your pockets; scratch not your head, wink not with your eye, but modestly look straight before you. Walking with your superior in the house or garden, give him the right hand, and walk not too near, but a little behind him: yet not so distant as that it shall be troublesome to him to speak to you, or hard for you to hear. Look not boldly or wishfully in the face of your superior. Do not look upon one in company and immediately whisper to another: it is unmannerly. Whisper not in company. Be not froward and fretful among your equals, but gentle and affable.

YOUR CONDUCT IN CONVERSATION

Among superiors, speak not till you are spoken to, or asked to speak. Hold not your hand, nor any thing else, before your mouth when you speak. Come not very near the person you speak to. Speak neither very loud, nor too low. Speak clear, not stammering, stumbling, nor drawling. Answer not one that is speaking to you, until he is done. Loll not when you are speaking to a superior, or spoken to by him.

YOUR CONDUCT AT SCHOOL.

Bow at coming in, pulling off your hat; especially if your master or usher be in the school. Loiter not, but immediately take your own seat, and move not from one place to another, till school-time be over. If your preceptor be discoursing in the school with a stranger, stare not confidently on them, nor hearken to their conversation. Interrupt not your master while a stranger or visitant is with him, with any question, request, or complaint; but defer any such matter till he be at leisure. At no time quarrel or talk in the school; but be quiet, peaceable, and silent. Neither deceive yourself, in trifling away your precious time in play. If your master speak to you, rise up making your answer standing. Bawl not aloud in making complaints. A boy's tongue should never be heard in the school but in answering a question, or saying his lesson. If a stranger speak to you in school, stand up and answer with the same respect and ceremony, both of word and gesture, as if you spoke to your master. Make not haste out of school, but go soberly when your turn comes, without noise or hurry. Go not rudely home through the streets. Stand not talking with boys who delay you: but walk, and with all convenient speed. When it is time to return to school again, be sure to be there in season, and not loiter at home while your master is at school. Divulge not to any person whatever, elsewhere, any thing that hath passed in the school, whether spoken or done.

YOUR CONDUCT IN THE STREET.

Go not singing, whistling, or hallooing along the street. Quarrel not with any body you meet or overtake. Affront no one, especially your elders, by word or deed. Jeer not at any person whatever. Always give the right hand to your superiors, when you walk with them. But when three persons walk together, the middle place is the most honourable; and a son may walk at his father's right hand, when his younger brother walks at his left. Give your superiors leave to pass before you in any narrow place, where two persons cannot pass at once. If you go with your parents, master, or any superior, go not playfully through the streets. Pay your respects to all you meet of your acquaintance or friends. Run not hastily in the street, nor go too slowly; wag not to and fro, nor use any antic or wanton postures, either of your head, hands, feet, or body. Stare not at every unusual person or thing which you see, &c. Whilst in the street, do not throw any thing; such as dirt, stones, &c. And offend not the master or scholars of another school.

* These, and the following short rules for behaviour, are digested from a small book, entitled "The Polite Present, or Child's Manual of Good Manners," published at Glasgow by John Reid and Company. It is the only work of the kind we ever saw, and should be bought by parents for their children

SPANISH ETIQUETTE.

[By D'Israeli.]

The etiquette or rules to be observed in the royal palaces is necessary, writes Baron Bielfield, for keeping order at court. In Spain it was carried to such length as to make martyrs of their kings. Here is an instance, at which, in spite of the fatal consequences it produced, one cannot refrain from smiling.

Philip the Third was gravely seated by the fireside: the fire-maker of the court had kindled so great a quantity of wood, that the monarch was nearly suffocated with heat, and his *grandeur* would not suffer him to rise from the chair; the domestics could not *presume* to enter the apartment, because it was against the *etiquette*. At length the Marquis de Potat appeared, and the king ordered him to damp the fires; but *he* excused himself, alleging that he was forbidden by the *etiquette* to perform such a function, for which the Duke d'Usseda ought to be called upon, as it was his business. The duke was gone out; the *fire* burnt fiercer; and the *king* endured it, rather than derogate from his *dignity*. But his blood was heated to such a degree, that an erysipelas of the head appeared the next day, which, succeeded by a violent fever, carried him off in 1621, in the twenty-fourth year of his age.

The palace was once on fire; a soldier, who knew the king's sister was in her apartment, and must inevitably have been consumed in a few moments by the flames, at the risk of his life rushed in, and brought her highness safe out in his arms: but the Spanish *etiquette* was here wofully broken into! The loyal soldier was brought to trial, and, as it was impossible to deny that he had entered her apartment, the judges condemned him to die! The Spanish princess, however, condescended, in consideration of the circumstance, to *pardon* the soldier, and very benevolently saved his life!

When Isabella, mother of Philip the Second, was ready to be delivered of him, she commanded that all the lights should be extinguished; that if the violence of her pain should occasion her face to change colour, no one might perceive it. And when the midwife said, "Madam, cry out, that will give you ease," she answered, in *good Spanish*, "How dare you give me such advice? I would rather die than cry out."

> "Spain gives us *pride*—which Spain to all the earth
> May largely give, nor fear herself a dearth!"
>
> CHURCHILL.

Philip the Third was a weak bigot, who suffered himself to be governed by his ministers. A patriot wished to open his eyes, but he could not pierce through the crowds of his flatterers; besides that, the voice of patriotism heard in a corrupted court would have become a crime never pardoned. He found, however, an ingenious manner of conveying to him his censure. He caused to be laid on his table one day a letter sealed, which bore this address—"To the King of Spain, Philip the Third, at present in the service of the Duke of Lerma."

In a similar manner, Don Carlos, son to Philip the Second, made a book with empty pages, to contain the voyages of his father, which bore this title—"The Great and Admirable Voyages of the King, Mr Philip." All these voyages consisted of going to the Escurial from Madrid, and returning to Madrid from the Escurial. Jests of this kind at length cost him his life.—*Curiosities of Literature.*

NUMBER OF A PERSON'S ANCESTORS.

To one who has not thought upon the subject, it is quite inconceivable how rapidly a person's lineal ancestors multiply every generation that he carries back the calculation. If one is asked how many great-great-grandfathers he had, he will in all likelihood answer, "two," while in reality he had *eight*, if there have been no intermarriages of relations among his ancestors. In fact, the number of male ancestors doubles every generation. Thus, every one has had two grandfathers, four great-grandfathers, eight great-great-grandfathers, sixteen great-great-great-great-grandfathers; and, fifteen generations back, he had no less than 16,384 lineal male ancestors. Fifteen generations (allowing three generations in the century) will take us back to the period of the battle of Bannockburn (1314): and, allowing the population of Scotland at that time to have been 500,000, of whom 125,000, or one-fourth, were able to bear arms, every one's ancestors thus constituted about one-eighth part of the whole fighting men of Scotland; and as there were 30,000 on the field on that memorable and glorious day, every Scot living at the present period may lay claim to the honour of having had, in all probability, one-eighth, or 1500, of these heroes his *own lineal ancestors.*

BLASTING ROCKS UNDER WATER BY MEANS OF THE DIVING BELL.

Three men are employed in the diving bell; one holds the jumper, or boring iron, which he keeps constantly turning; the other two strike alternately quick smart strokes with hammers. When the hole is bored of the requisite depth, a tin cartridge, filled with gunpowder, about two inches in diameter and a foot in length, is inserted, and sand placed above it. To the top of the cartridge a tin pipe is soldered, having a brass screw at the upper end. The diving bell is then raised up slowly, and additional tin pipes with brass screws are attached, until the pipes are about two feet above the surface of the water. The man who is to fire the charge is placed in a boat close to the tube, to the top of which a piece of cord is attached, which he holds in his left hand. Having in the boat a brazier, with small pieces of iron red hot, he drops one of them down the tube; this immediately ignites the powder, and blows up the rock. A small part of the tube next the cartridge is destroyed; but the greater part, which is held by the cord, is reserved for future service. The workmen in the boat experience no shock; the only effect is a violent ebullition of the water arising from the explosion; but those who stand on the shore and upon any part of the rock connected with those blowing up, feel a very strong concussion. The only difference between the mode of blasting rock at Howth and at Plymouth is, that at the latter place they connect the tin pipes by a cement of white lead. A certain depth of water is necessary for safety, which should not be less than from eight to ten feet.—*Repertory of Patent Inventions.*

COACH HORSES.

The average price of horses for fast coaches may be about L.23. Fancy teams, and those working out of London, may be rated considerably higher than this; but taking a hundred miles of ground, well horsed, this is about the mark. The average period of each horse's service does not exceed four years in a fast coach—perhaps scarcely so much. In a slow one we may allow seven; but in both cases we are alluding to horses put to the work at five or six years old. Considerable judgment is necessary to the selection of horses for fast work in harness; for if they have not action which will command the pace they are timed at, they soon destroy themselves. For a wheel-horse, he should have sound fore legs, or he cannot be depended upon down hill. Good hind legs and well spread guskins are also essential points in a coach horse—the weight or force applied proceeding from the fulcrum formed by the hinder feet. The price we have named as the average one for such animals may appear a very low one; but we must remember, that, to be a hunter, a horse must have length of shoulder, length of frame, well placed hinder legs, and a well bitted mouth; whereas, without any of these qualities, he may make an excellent coach horse, and hence the value of the coach market to our breeders.—*Quarterly Review.*

No. 63. SATURDAY, APRIL 13, 1833. PRICE THREE HALFPENCE.

THE TURN OF THE PENNY.

ONE morning, happening to pass through a suburb of this large city, where much vice, no doubt, but, perhaps, equal misery, is congregated, I overheard a wretched-looking female, with a string of knittings tied to the handle of her basket, and a few thimbles and small looking-glasses in the bottom of it, in conversation with another who was arranging greens upon a stall. "I was out all yesterday," she said, "through mony streets, and up mony stairs; and, woman, a' that I drew was just three halfpence: but if it were never sae little, its aye *the turn o' the penny;* and I'm just gaun out to try again the day." These touching words forcibly recalled to my mind those of a very eminent orator, when contrasting his own political consistency with that of certain of his party who had recently made a public boast of it. "It is all very well," said Sheridan, "for Lord This and Lord That to resist the temptation of place; but it is not so easy for me, who in all my life never possessed a shilling that I could call my own." Such was exactly the case of the poor basket-woman in comparison with that of more fortunate traders. In this great commercial country, there are said to be shopkeepers who draw over their counter four or five hundred pounds a-day. Of how little consequence to them were the entire loss of custom for a week! How small their merit in maintaining a fair and honourable character! But she! if she were a solitary widow, could the world say to her, "you have your share of good things; you have three halfpence a-day! why should you be discontented or dishonest?" If she had a fatherless family dependent on her earnings, could she deal a sufficient morsel to all—clothe them—educate them—bid them all be thankful? If she had a husband who spent his wages in profligate riot, and left her to maintain her children, could such gains keep them with the smallest measure of comfort? Verily, if the minds of many poor were not supported by a spirit of submission and contentment, it is not easy to see how they should otherwise be prevented from becoming soured, exasperated, and desperate. When this unhappy consequence does ensue, they are certainly not in any respect justifiable—we cannot say that human laws ought not to punish them; but their cases demand a more lenient consideration than if they had erred at the instigation of less pressing temptation. When a capital crime is committed, it starts before us all at once in its full enormity; the inducement or the provocation appears totally inadequate to have urged its perpetration; and the guilty author, denounced as possessing nothing in common with his fellow-men but the shape, is denied every access to their sympathies. But an abhorrence of depravity ought never to steel the heart with a determined animosity against the veriest wretch: we can estimate the amount of guilt, but not relatively. We cannot tell how the mind of him who suffers for his wickedness may have been studiously perverted from his youth, or how the hard usage of the world seared his better feelings, clouded his understanding, and nourished the evil passions, from inconsiderable beginnings, into fearful energy. Because we are placed beyond the sphere of temptation, we are too apt to deem ourselves proof against its power; we cannot see why others should have yielded more than we. "Sir," is a boast not unfrequently heard, "I am above such a thing; I would not act so basely for the world." No, not for the world perhaps; but to keep life and soul together—to satisfy the hunger of those whose pangs it is more grievous to witness than to suffer in our own persons—who can tell what he would do in that emergency? Many citadels have the reputation of being impregnable, only because they were never assailed. What is then to be done? Are we to look to the palliating circumstances alone, when a misdemeanour comes before us; or whenever a case of distress is presented, are we to be indiscriminately charitable? This is not what should be done to the full extent; but, at the same time, we should never forget that, in denying an importunate beggar, we perhaps furnish him with a justification in his own eyes for resorting to dishonest or violent means of procuring what he cannot obtain from the pity of his fellow-creatures: and, above all, we should never grudge their small gains to the exertions of ingenuity or labour, however humble. How can we tell but it is the last effort the miserable objects before us have resolved to make, and that, if we close our hearts against their appeals, we are in fact thrusting them back among the ranks of the openly and hopelessly profligate? If we suppose that the poor creature who sold three halfpence worth of goods in a day, realized by her bargains one hundred per cent., she must have cleared only the pittance of a halfpenny farthing; yet she was by this success encouraged to go on in her laudable endeavours to procure an honest livelihood.

Let us not, then, turn with a contemptuous sneer from the picture of human beings, however mean and poor, exerting their skill in honest though almost ineffectual labour. We have often thought there is a blessing on industry, even if exerted in the most trifling degree. How respectable it seems in comparison with idleness and pampered vice! Near the gateway of one of the public offices in Edinburgh, there sits every day, during both summer and winter, from an early hour in the morning till nightfall, a poor old woman, a widow, whose occupation is to sell fruits and small comfits to children, and by which she realizes about the sum of threepence a-day. She also employs herself in knitting, but in this she is not regularly engaged, and altogether clears from one shilling and ninepence to two shillings a-week. With this humble weekly pittance she not only keeps herself from depending on the parish, but gives support, such as it is, to two children, left to her charge by the death of her husband, who was killed by the falling in of a quarry. Now, the lot of this very poor and humble widow would by many be reckoned deplorable, and in the last degree mean. Yet, how noble are her feeble efforts!—how noble are the efforts of all such unaided individuals! and how much are these efforts calculated to produce happy reflections, in comparison with the exertions of the dissolute in squandering the means of others, or of that listless indolence which induces reliance for support on public charity! The poor industrious widow is a respectable member of society, while the dissolute spendthrift and the competent pauper are equally objects of reproach.

The persevering efforts of poor women in gaining an honest subsistence by their industry, are no where so conspicuous as in Scotland, and that not only in the more unsophisticated parts of the country, but in the populous and refined cities. A class of individuals rendered destitute by family deprivation, and who would, if in the adjacent country, most likely, rely on the parish—that is, depend on compulsory alms—for support, here project many little schemes for acquiring an honourable, and, in some measure, independent subsistence; and how gratifying is it to state, that their endeavours are generally blessed!—blessed not only as regards their individual exertions, but as respects the welfare of the whole community. These will assuredly be esteemed pleasing characteristics of a people. Never, therefore, let us forget the utility of such admirable examples, or turn with affected contempt from the efforts of the humble and industrious poor. Much rather let us learn to sympathize in their fate, as beings fully as good but not so lucky as ourselves, and in the spectacle of enduring hope which they oftentimes present, be more and more impressed with the conviction, that Providence never refuses to yield protection and consolation to the afflicted, nor leaves, unassisted, the desolate to mourn.

POPULAR INFORMATION ON SCIENCE.

SNOW.

WHEN aqueous particles freeze in icy lines, and aggregate together, they form flakes of snow, which, descending through the air, and accumulating on the ground, constitute the appropriate characteristic of the winter season. An intensely cold current of air, mixing with the vapour suspended in a warmer current, occasions, as in the case of hail, this precipitation. Snow, however, is formed in the lower regions of the atmosphere, or might, if commencing in a small nucleus, in higher regions, be converted in its descent into hail. That snow is formed in this manner, there can be no doubt; for a very cold stream of air, admitted into a room in which the contained air is warmer, and loaded with watery particles, will occasion its formation. In the huts of the people in the desolate arctic regions, snow is often so formed; they stop the chinks, yet still the walls are often covered with a thick icy crust; and whenever a cold current from the external air is admitted, snowy flakes are precipitated. Dr Robertson of this university states, that, in a crowded assembly room at St Petersburgh, a stream of cold air was accidentally admitted into the room by a gentleman breaking a pane of glass, on which the vapour in the air was immediately congealed, and fell in the form of snow-flakes. In Siberia, Pallas, Chappe, and others, have seen it formed under similar circumstances; and, by the narrative of the Dutchmen who wintered in Nova Zembla, we are informed that a shower of snow fell, from the vapour of expiration, every time there was any communication with the external air. The peculiarities of snow consist in its extreme lightness, and also in its being purely white. Its lightness is occasioned by the excess of its surface exceeding so much in comparison the matter it contains; as gold leaf may be extended until it rides on the breath of every wind. Its whiteness is owing to the minute particles into which it is divided; hence, when ice is pounded, it is equally white. When snow, however, accumulates in large quantities, its weight becomes very considerable. On the 26th of April 1809, we read that a storm happened in the neighbourhood of Bath, which lasted nearly eighteen hours. It covered the ground, on an average, to the depth of sixteen inches, and trees of considerable size were bent double, and stript of their branches by its weight. Snow occurs in all regions of the globe at a certain height above the level of the sea, but falls more abundantly on plains as we proceed from the equator to the poles. In the arctic regions, snow falls nine days out of ten during the months of April, May, and June, and often a depth of two or three inches is deposited in an hour. In these regions, the thickest precipitations are observed to precede the occurrence of storms.

The forms of snow-flakes present an almost endless variety; they are often very regular and beautiful, and reflect with exceeding splendour the rays of the sun. When they are very large, they are said to indicate the approach of thunder. After a copious fall of snow, when the temperature is too low to produce any moisture, its level surface may often be seen sprinkled with thin delicate plates of ice, which refract

the light in colours as varied and brilliant as drops of dew. At such times, on the borders of lakes, and on the leaves of trees, groups of feathery icy crystals may be seen, remarkable for the most exquisite delicacy. The various modifications of crystals assumed by snow, are well described by Captain Scoresby, in his interesting account of the arctic regions; and he justly observes, that "the extreme beauty and endless variety of microscopic objects procured in the animal and vegetable kingdoms, are perhaps fully equalled, if not surpassed, in both the particulars of the beauty and the variety of its crystals."

Snow is occasionally—but not frequently seen—of a brown colour, which arises from its being impregnated with earthy substances, brought from the mountains by those streams of water which are derived from the thawing of ice or snow. Much oftener has snow been observed of a red colour, which appears generally to have arisen from its intermixture with some vegetable substance. Such was the nature of the red-coloured snow observed by Captain Ross. With respect to the exact origin of that substance (says the late learned Dr Wollaston), I apprehend that we may not be able to give a decided opinion, for want of a sufficient knowledge of the productions of the regions in which it is found; but from all the circumstances of its appearance, and the substances which accompany it, I am strongly inclined to think it of vegetable origin. His supposition was confirmed, it appears, by Mr Bauer, who found the red matter to consist of a vegetable of the genus *Uredo*, which, he considers, originates and is generated in the snow. Captain Scoresby informs us, that, in the arctic regions, the redness of the snow may occasionally be attributed to the little auk (*Alca alle*), which feeds on shrimps, and accumulates in immense numbers; besides which, he has found it to be sometimes occasioned by the dung of birds. Marteus, at Spitzbergen, saw red snow, which he considered to have been stained by the rain-water running down the rocks. This peculiar red matter possesses, it is stated, a very offensive odour, resembling a mixture of fish oil and drying oil, or the very coarse paint used for covering pallisades and wood in the open air.

Besides these peculiarities, snow-storms have been found to exhibit a luminous appearance, the cause of which is certainly not understood. In March 1813, such a shower overtook a party in Argyleshire, who were at the time on a pleasure excursion on Loch Awe. The snow which fell had a luminous appearance, which was retained, not only on the sides of the boat, but on the garments of the persons present. They seemed to burn, although they felt no heat; and when they touched the snow, their hands for some time remained luminous. This strange phenomenon may have been produced by electricity; but the truth is, that this fact, which is recorded on authentic testimony, does not admit of any satisfactory explanation; and it is better in this, and in all other instances, candidly to acknowledge our ignorance, rather than to adopt a theory which is ostensibly unfounded, and only set up to gratify human vanity.

Notwithstanding that snow often accumulates in vast masses on the branches of trees, on the brows of rocks, and on the tops of high and irregular objects —on plains it generally preserves a certain level—yet sometimes, by the action of the wind, it is rolled along until it accumulates in large masses. In the month of December 1813, snow fell in considerable quantities during the day in the neighbourhood of London; but the meteorological report states, that, "instead of driving loose before the wind, it was occasionally collected into a ball, which rolled on, increasing, till its weight stopped it; thousands of these were to be seen lying in the fields, some of them many inches in diameter." On the 1st of April 1815, balls of snow were, in like manner, formed at Brunswick. Their texture was homogeneous, and they were extremely light, consisting of minute prisms of snow irregularly aggregated. They were formed by having been rolled to a considerable distance by the wind, and their paths were in general distinctly visible. The smaller ones, however, seemed to have been formed in their descent through the atmosphere, as they were found in woods and in small enclosures. Sometimes the balls of snow thus formed attain very considerable magnitude.

Snow, which in this country falls generally most copiously during the months of December, January, and February, seldom occurs so early as October, and is generally, after remaining some time on the ground, dissipated by an increase of temperature, arising from the direct action of the sun's rays, or the fall of rain. Occasionally, however, it disappears without any apparent thaw, or so much dissipates as to leave deep furrows on the snowy plain. This arises from the snow itself being evaporated, which will occur even below the freezing point. "On the night of the 10th of February," says Luke Howard, "I exposed 100 grains of light snow, spread on a dish (which had previously the temperature of the air) of six inches in diameter. In the first hour after dark it lost five grains; in the third it acquired a grain, the wind having changed, and the temperature, which had been falling from 25°, inclining to rise again. In the course of the night the loss was about 60 grains." This very ingenious author adds, that this evaporation from snow probably supplies the water for the formation of those thin mists which appear during intense frost. The air then becomes partially loaded with particles of ice, or with water, at so low a temperature as to be ready to become solid the moment they find support. Hence, too, may arise the rime-frost which is found to accumulate on the windward side of the twigs and branches of shrubs and trees. Snow seldom remains long in temperate latitudes on plains or in vallies, but on the tops of high mountains occasionally appears throughout the year. It has thus been noticed on the summits of the Juras to remain throughout the summer, until the snows of another wintry season have accumulated on the same summits. In the arctic regions it continues, undissolved, to present a wintry and dreary aspect throughout the year; but there only lichens or mosses abound, or those plants which rank lowest in the scale of organization. Indeed, snow is itself a beneficent provision of nature for protecting the earth during the season of winter. Its structure being light and spongy, and admitting much air between its particles, interrupts the transmission or escape of heat from the soil, and thereby the roots of herbs and plants are enabled to preserve the heat necessary for the support of life, while the atmosphere above the snowy covering of the earth is many degrees below the freezing point. On this principle snow huts are inhabited by the natives of the arctic regions, wherein they find sufficient protection from the intense cold of the surrounding air

When the light of the sun is reflected from snow, its intensity is often almost intolerable, producing very great pain and inflammation of the eyes. Even in those snowy regions where mountains of ice and fields of snow present a dreary and monotonous waste, through all seasons, the natives are not reconciled by habit to the inconvenience; for most of them are afflicted by dreadful diseases of the organ of vision. The intrepid navigators who have likewise penetrated into those dangerous northern latitudes, have been obliged to use eye-shades; notwithstanding which, they have experienced much suffering. Occasionally, however, the prisms of snow are so formed, and the sun's light is so directed on them, as to undergo a refraction, which presents us with the most beautiful and vivid colours. When the sun sets, and its rays yet linger on the glaciers and snows on the summit of Mont Blanc, this is seen in the most exquisite perfection; we then truly behold

> "The rose-tints, which summer twilight yields
> Upon the lofty glacier's virgin snow;
> The blush of earth embracing with her heaven!"

Here, as in other instances, we cannot fail to observe how the hand of the Creator seems to have thrown a robe of beauty over every feature of the world. It remains for us to pursue our pilgrimage through it with an inquiring mind, endeavouring to obtain that knowledge which conducts to the highest species of human happiness

BARNY O'REIRDON THE NAVIGATOR.

Barny O'Reirdon was a fisherman of Kinsale, and a heartier fellow never hauled a net nor cast a line into deep water: indeed, Barny, independently of being a merry boy among his companions, a lover of good fun and good whisky, was looked up to, rather, by his brother-fishermen as an intelligent fellow, and few boats brought more fish to market than Barny O'Reirdon's; his opinion on certain points in the craft was considered law; and in short, in his own little community, Barny was what is commonly called a leading man.

Seated one night at a public house, the common resort of Barny and other marine curiosities, our hero got entangled in debate with what he called a strange sail—that is to say, a man he had never met before, and whom he was inclined to treat rather magisterially upon nautical subjects, at the same time that the stranger was equally inclined to assume the high hand over him, till at last the new comer made a regular outbreak by exclaiming, "Ah, lave aff your balderdash, and maybe I don't know you and your's as well as the mother that bore you, ay, in throth; and shure I know the very thoughts o' you as well as if I was inside o' you, Barny O'Reirdon."

"Thin you know better thoughts than your own, Mr Whipper-snapper, if that's the name you go by."

"No, its not the name I go by; I've as good a name as your own, Mr O'Reirdon, for want of a betther, and that's O'Sullivan."

"Throth there's more than there's good o' them," said Barny.

"Good or bad, I'm a cousin o' your own, twice removed by the mother's side."

"And is it the Widda O'Sullivan's boy you'd be that's left this come Candlemas four years?"

"The same."

"Throth thin you might know betther manners to your eldhers, though I'm glad to see you, anyhow, agin; but a little thravellin' puts us beyant ourselves sometimes," said Barny, rather contemptuously.

"Throth I niver bragged out o' myself yit, and its what I say, that a man that's only a fishin' aff the land all his life has no business to compare wid a man that has sailed to Fingal."

This silenced any further argument on Barny's part. Where Fingal lay was all Greek to him; but unwilling to admit his ignorance, he covered his retreat with the usual address of his countrymen, and turned the bitterness of debate into the cordial flow of congratulation at seeing his cousin again.

The liquor was freely circulated, and the conversation began to take a different turn, in order to lead from that which had nearly ended in quarrel between O'Reirdon and his relation.

After the introduction of the liquor, it would not be an easy matter to pursue the conversation that followed. Let us, therefore, transfer our story to the succeeding morning, when Barny O'Reirdon strolled forth from his cottage, rather later than usual, with his eyes bearing *eye*-witness to the carouse of the preceding night. He sauntered about in the sun, at which he often looked up, under the shelter of compressed bushy brows and long-lashed eyelids, and a shadowing hand across his forehead, to see "what time o' day" it was, and from the frequency of this action it was evident the day was hanging heavily with Barny. He retired at last to a sunny nook in a neighbouring field; and stretching himself at full length, he basked in the sun, and began "to chew the cud of sweet and bitter thought." He first reflected on his own undoubted weight in his little community, but still he could not get over the annoyance of the preceding night, arising from his being silenced by O'Sullivan, "a chap," as he said himself, "that lift the place four years agon, a brat iv a boy, and to think iv his comin' back and outdoin' his eldhers, that saw him runnin' about the place, a gas-soon, that one could tache a few months before;" 'twas too bad. Barny saw his reputation was in a ticklish position, and began to consider how his disgrace could be retrieved. The very name of Fingal was hateful to him; it was a plague-spot on his peace that festered there incurably. He first thought of leaving Kinsale altogether; but flight implied so much of defeat, that he did not long indulge in that notion. No; he *would* stay "in spite of all the O'Sullivans, kith and kin, breed, seed, and generation." But, at the same time, he knew he should never hear the end of that hateful place, Fingal; and if Barny had had the power, he would have enacted a penal statute, making it death to name the accursed spot, wherever it was; but not being gifted with such legislative authority, he felt Kinsale was no place for him, if he would not submit to be flouted every hour out of the four-and-twenty, by man, woman, and child that wished to annoy him. What was to be done? He was in the perplexing situation, to use his own words, "of the cat in the thripe shop;" he did'nt know which way to choose. At last, after turning himself over in the sun several times, a new idea struck him. Could'nt he go to Fingal himself? and then he'd be equal to that upstart, O'Sullivan. No sooner was the thought engendered than Barny sprang to his feet a new man; his eye brightened, his step became once more elastic, he walked erect, and felt himself to be all over Barny O'Reirdon once more. "Richard was himself again."

But where was Fingal?—there was the rub. That was a profound mystery to Barny, which, until discovered, must hold him in the vile bondage of inferiority. The plain-dealing reader will say, "could'nt he ask?" No, no; that would never do for Barny—that would be an open admission of ignorance his soul was above, and, consequently, Barny set his brains to work, to devise measures of coming at the hidden knowledge by some circuitous route, that would not betray the end he was working for. To this purpose, fifty stratagems were raised and demolished in half as many minutes, in the fertile brain of Barny, as he strided along the shore, and as he was working hard at the fifty-first, it was knocked all to pieces by his jostling against some one who he never perceived was approaching him, so immersed was he in his speculations, and, on looking up, who should it prove to be but his friend, "the long sailor from the Aysthern Injees." This was quite a god-send to Barny, and much beyond what he could have hoped for. Of all the men under the sun, the long sailor was the man in a million for Barny's net at that minute, and, accordingly, he made a haul of him, and thought it the greatest catch he ever made in his life.

Barny and the long sailor were in close companionship for the remainder of the day, which was closed, as the preceding one, in a carouse; but on this occasion there was only a duet performance in honour of the jolly god, and the treat was at Barny's expense. What the nature of their conversation during the period was, we will not dilate on—we will keep it as profound a secret as Barny himself did, and content ourselves with saying, that Barny looked a much happier man the next day. It was in this agreeable spirit that Barny bent his course to the house of Peter Kelly, in order to put in practice a plan he had formed for the fulfilment of his determination of rivalling O'Sullivan.

As the Irish saying is, "to make a long story short," Barny prevailed on Peter Kelly to make an export, but in the nature of the venture they did not agree. Barny had proposed potatoes; Peter said there were enough of them already where he was going, and Barny rejoined that "praties were so good in themselves, there never could be too much o' thim any where." But Peter being a "knowledgeable man, and up to all the saycrets of the airth, and understanding the the-o-ry and the chemis-thery," overruled Barny's proposition, and determined upon a cargo of *scalpeens* (which name they give to pickled mackarel), as a preferable merchandise, quite forgetting that Dublin Bay herrings were a much better and as cheap a commodity, at the command of the Fingalians. But by many similar mistakes, the ingenious Mr Kelly has been paralleled by other speculators. But that is neither here nor there, and it was all one to Barny whether his boat was freighted with potatoes or *scalpeens*, so long as he had the honour and glory of becoming a navigator, and being as good as O'Sullivan.

Accordingly, the boat was laden, and all got in readiness for putting to sea, and nothing was now wanting but Barny's orders to haul up the gaff and shake out the jib of his hooker.

The next day passed without the hooker sailing, and Barny gave a most sufficient reason for the delay, by declaring that he had a warnin' given him in a dhrame,

(glory be to God), and that it was given to him to undherstand (undher Heaven) that it wouldn't be looky that day.

Well, the next day was Friday; and Barny, of course, would not sail any more than any other sailor who could help it on this unpropitious day. On Saturday, however, he came running in a great hurry down to the shore, and, jumping on board, he gave orders to make all sail, and taking the helm of the hooker, he turned her head to the sea, and soon the boat was cleaving the blue waters with a velocity seldom witnessed in so small a craft, and scarcely conceivable to those who have not seen the speed of a Kinsale hooker.

"Well," said one of Barny's companions, for there were but two with him in the boat, "I was thinkin' myself, as well as Jimmy, that we lost two fine days for nothin', and we'd be there a'most, may be, now, if we sail'd three days agon. What course are you going to steer?

"You'll find out soon enough when we get there—and so I bid you agin' lay me alone—just keep your toe in your pump. Sure I'm here at the helm, and a woight an my mind, and its fitter for you, Jim, to mind your own business, and lay me to mind mine; away wid you there, and be handy; haul taught that foresheet there; we must run close an the wind; be handy, boys; make every thing dhraw."

These orders were obeyed, and the hooker soon passed to windward of a ship that left the harbour before her, but could not hold on a wind with the same tenacity as the hooker, whose qualities in this peculiarity render them particularly suitable for the purposes to which they are applied, namely, pilot and fishing-boats.

We have said a ship left the harbour before the hooker had set sail, and it is now fitting to inform the reader that Barny had contrived, in the course of his last meeting with the "long sailor," to ascertain that this ship, then lying in the harbour, was going to the very place Barny wanted to reach. Barny's plan of action was decided upon in a moment: he had now nothing to do but to watch the sailing of the ship, and follow in her course. Here was, at once, a new mode of navigation discovered.

For this purpose he went to windward of the ship, and then fell off again, allowing her to pass him, as he did not wish even those on board the ship to suppose he was following in their wake; for Barny, like all people that are quite full of one scheme, and fancy every body is watching them, dreaded lest any one should fathom his motives. All that day, Barny held on the same course as his leader, keeping at a respectful distance, however, "for fear 'twould look like dodging her," as he said to himself; but as night closed in, so closed in Barny with the ship, and kept a sharp look-out that she should not give him the slip in the dark. The next morning dawned, and found the hooker and ship companions still; and thus matters proceeded for four days, during the entire of which time they had not seen land since their first losing sight of it, although the weather was clear.

"The channel," thought Barny, "must be mighty wide in these parts, and, for the last day or so, we've been goin' purty free with a flowin' sheet, and I wondher we are'nt closin' in wid the shore by this time; or maybe it's farther aff than I thought it was." His companions, too, began to question Barny on the subject, but to their queries he presented an impenetrable front of composure, and said, "it was always the best plan to keep a good bowld offin'." In two days more, however, the weather began to be sensibly warmer, and Barny and his companions remarked, that it was "goin' to be the finest sayson—God bless it—that ever kem out o' the skies for many a long year, and maybe it's the whate wouldn't be beautiful, and a great plenty of it." It was at the end of a week, that the ship which Barny had hitherto kept a-head of him, showed symptoms of bearing down upon him, as he thought, and, sure enough, she did, and Barny began to conjecture what the deuce the ship could want with him and commenced inventing answers to the questions he thought it possible might be put to him in case the ship spoke him. He was soon put out of suspense by being hailed and ordered to run under her lee, and the captain, looking over the quarter, asked Barny where he was going?

"Faith, then, I'm goin' an my business," said Barny.

"But where?" said the captain.

"Why, sure an it's no matther where a poor man like me id be goin'," said Barny.

"Only I'm curious to know what the deuce you've been following my ship for, for the last week?'

"Follyin' your ship!—Why, thin, do you think it's follyin' yiz I am?"

"It's very like it," said the captain.

"Why, did two people niver thravel the same road before?"

"I don't say they did'nt; but there's a great difference between a ship of 700 tons, and a hooker."

"Oh, as for that matther," said Barny, "the same high road sarves a coach and four, and a low-back car; the thravellin' tinker, an' a lord a' horseback. Don't you know that sometimes vessels is bound to sail undher saycret ordhers?" said Barny, endeavouring to foil the question by badinage.

There was a universal laugh from the deck of the ship, at the idea of a fishing-boat sailing under secret orders; for by this time the whole broadside of the vessel was crowded with grinning mouths and wondering eyes at Barny and his boat.

"Oh, its a thrifle makes fools laugh," said Barny.

"Take care, my fine fellow, that you don't be laughing at the wrong side of your mouth before long, for I've a notion that you're cursedly in the wrong box, as cunning a fellow as you think yourself. Confound your stupid head, can't you tell what brings you here?"—and so the ship proceeded in its course.

In four days more, however, the provisions in the hooker began to fail, and they were obliged to have recourse to the *scalpeens* for sustenance; and Barny then got seriously uneasy at the length of the voyage, and the still likely greater length, for any thing he could see to the contrary, and, urged at last by his own alarms and those of his companions, he was enabled, as the wind was light, to gain on the ship; and when he found himself alongside, he demanded a parley with the captain.

The captain, on hearing that the "hardy hooker," as she got christened, was under his lee, came on deck; and, as soon as he appeared, Barny cried out—

"Why, thin, captain dear, do you expec' to be there soon?"

"Where?" said the captain.

"Oh, you know yourself," said Barny.

"It's well for me I do," said the captain.

"Thrue for you indeed, your honour," said Barny, in his most insinuating tone; "but whin will you be at the ind o' your voyage, captain jewel?"

"I dare say in about three months," said the captain.

"Oh, Holy Mother!" ejaculated Barny; "three months! arrah it's jokin' you are, captain dear, and only want to freken me."

"How should I frighten you?" asked the captain.

"Why, thin, your honour, to tell God's thruth, I heerd you wor goin' *there;* an as I wanted to go there too, I thought I couldn't do better nor to folly a knowledgeable gintleman like yourself, and save myself the throuble iv findin' it out."

"And where do you think I *am* going?" said the captain.

"Why, thin," said Barny, "isn't it to Fingal?'

"No," said the captain; "'tis to *Bengal*."

"Oh!" said Barny, "what'll I do now at all at all?"

The captain ordered Barny on deck, as he wished to have some conversation with him on what he, very naturally, considered a most extraordinary adventure. Heaven help the captain! he knew little of Irishmen, or he would not have been so astonished. Barny made his appearance. Puzzling question, and more puzzling answer, followed in quick succession between the commander and Barny, who, in the midst of his dilemma, stamped about, thumped his head, squeezed his caubeen into all manner of shapes, and vented his despair anathematically—

"Oh! my heavy hathred to you, you tarnal thief iv a long sailor—its a purty scrape yiv led me into. I thought it was *Fin*gal he said, and now I hear it is *Bin*gal. Oh! the divil sweep you for navigation, why did I meddle or make wid you at all at all! and my curse light on you, Terry O'Sullivan, why did I iver come across you, you onlooky vagabonde, to put sitch thoughts in my head? An so its *Bin*gal, and not *Fin*gal, you're goin' to, captain?"

"Yes indeed, Paddy."

"An might I be so bowld to ax, captain, is Bingal much farther nor Fingal?"

"A trifle or so, Paddy."

"Och, thin, millia murther, weirasthru, how 'll I iver get there at all at all?" roared out poor Barny.

"By turning about, and getting back the road you've come as fast as you can."

"Is it back? Oh! Queen iv Heaven! an how will I iver get back?" said the bewildered Barny.

"Then you don't know your course, it appears?"

"Oh, faix, I knew it iligant as long as your honour was before me."

"But you don't know your course back?"

"Why, indeed, not to say rightly all out, your honour."

"Can't you steer?" said the captain.

"The divil a betther hand at the tiller in all Kinsale," said Barny with his usual brag.

"Well, so far so good," said the captain; "and you know the points of the compass—you have a compass, I suppose."

"A compass! by my sowl an it's not let alone a compass, but a *pair* o' compasses I have, that my brother, the carpinthir, left me for a keepsake whin he wint abroad; but, indeed, as for the points o' thim, I can't say much, for the childher spylt thim intirely, rootin' holes in the flure."

"Confound your thick head!" said the captain. "Why, what an ignoramus you must be, not to know what a compass is, and you at sea all your life? Do you even know the cardinal points?"

"The cardinals! faix an it's a great respect I have for them, your honour. Sure, ar'n't they belongin' to the Pope?"

"Confound you, you blockhead! roared the captain in a rage—"'twould take the patience of the Pope and the cardinals, and the cardinal virtues into the bargain, to keep one's temper with you. Do you know the four points of the wind?"

"I do, and more."

"Well, never mind more, but let us stick to four. You're sure you know the four points of the wind?'

"By dad, it would be a quare thing if a sayfarin' man did'nt know somethin' about the wind, any how."

"Well, Paddy," said the captain, after trying to persuade him to come along with the ship, "as you are determined to go back, in spite of all I can say, you must attend to me while I give you as simple instructions as I can. You say you know the four points of the wind, North, South, East, and West."

"Yis, Sir."

"How do you know them, for I must see that you are not likely to make a mistake—How do you know the points?"

"Why, you see, Sir, the sun, God bless it, rises in the aist, and sets in the west, which stands to raison; and whin you stand bechuxt the aist and the west, the north is forninst you."

"And when the north is forninst you, as you say, is the east on your right, or your left hand?"

"On the right hand, your honour."

"Well, I see you know that much, however. Now," said the captain, "the moment you leave the ship, you must steer a nor-east course, and you will make some land, near home, in about a week, if the wind holds as it is now, and it is likely to do so; but, mind me, if you turn out of your course in the smallest degree, you are a lost man."

"Many thanks to your honour!"

"And how are you off for provisions?"

"Why, thin, indeed, in the regard o' that same, we are in the hoighth o' disthress, for, exceptin' the scalpeens, sorra taste passed our lips for these four days."

"Oh! you poor devils!" said the commander, in a tone of sincere commiseration, "I'll order you some provisions on board before you start."

"Long life to your honour! and *I'd like to drink the health* of so noble a jintleman."

"I understand you, Paddy; you shall have grog too."

"Musha, the heavens shower blessins an you, I pray the Virgin Mary and the twelve Apostles, Matthew, Mark, Luke, and John, not forgettin' St Pathrick."

"Thank you, Paddy; but keep all your prayers for yourself, for you need them all to help you home again."

"Oh! never fear, whin the thing is to be done, I'll do it, by dad, wid a heart and a half."

"Now, then, Barny, the sooner you turn your face towards home, the better," said the captain; "since you will go, there is no need in losing more time. Are you sure you remember my directions?"

"Throth an I'll niver forget them to the day o' my death, and is bound to pray, more betoken, for you and yours."

"Don't mind praying for me till you get home, Barny; but answer me, how are you to steer when you shall leave me?"

"The nor-aist coorse, your honour; that's the coorse agin the world."

"Remember that! never alter that course till you see land—let nothing make you turn out of a nor-east course."

"Throth an' that id be the dirty turn, seein' that it was yourself that ordered it. Oh, no, I'll depend my life an the *nor-aist coorse*, and God help any one that comes betune me an' it—I'd run him down if he was my father."

"Well, good bye, Barny."

"Good bye, and God bless you, your honour, and send you safe."

"That's a wish you want more for yourself, Barny—never fear for me, but mind yourself well."

"Oh sure I'm as good as at home wanst I know the way, barrin the wind is conthrary; sure the nor-aist coorse 'ill do the business complate." And so saying, Barny descended the ship's side, and once more assumed the helm of the "hardy hooker."

The two vessels now separated on their opposite courses. What a contrast their relative situations afforded! Proudly the ship bore away under her lofty and spreading canvass, cleaving the billows before her, manned by an able crew, and under the guidance of experienced officers—the finger of science to point the course of her progress, the faithful chart to warn her of the hidden rock and the shoal, the log-line and the quadrant to measure her march and prove her position. The poor little hooker cleft not the billows, each wave lifted her on its crest like a sea-bird; but three inexperienced fishermen to manage her; no certain means to guide them over the vast ocean they had to traverse, and the holding of the "fickle wind" the only *chance* of their escape from perishing in the wilderness of waters. By the one, the feeling excited is supremely that of man's power. By the other, of his utter helplessness. To the one, the expanse of ocean could scarcely be considered "trackles." To the other, it was a waste indeed.

Yet the cheer that burst from the ship at parting was answered as gaily from the hooker as though the odds had not been so fearfully against her, and no blither heart beat on board the ship than that of Barny O'Reirdon.

Happy light-heartedness of my poor countrymen! they have often need of all their buoyant spirits! How kindly have they been fortified by nature against the assults of adversity; and if they blindly rush into danger, they cannot be denied the possession of gallant hearts to fight their way out of it if they can.

But each hurra became less audible. By degrees the cheers dwindled into faintness, and, finally, were lost in the eddies of the breeze.

The sense of utter loneliness and desolation had not come upon Barny until now; but he put his trust in the goodness of Providence, and in a fervent inward outpouring of prayer, resigned himself to the care of his Creator.

The night fell, and Barny stuck to the helm as long as nature could sustain want of rest, and then left it in charge of one of his companions, with particular directions how to steer, and ordered, if any change in wind occurred, that they should instantly awake him. He could not sleep long, however; the fever of anxiety was upon him, and the morning had not long dawned when he awoke. He had not well rubbed his eyes, and looked about him, when he thought he saw a ship in the distance approaching them. As the haze cleared away, she showed distinctly bearing down towards the hooker. On board the ship, the hooker, in such a sea, caused surprise as before, and in about an hour she was so close as to hail, and order the hooker to run under her lee.

"The divil a taste," said Barny, "I'll not quit my *nor-aist coorse* for the king of Ingland, nor Bonyparty into the bargain. Bad cess to you, do you think I've nothin' to do but to plaze you?"

Again he was hailed, and fired at, but he preserved his course, and got clear off.

The third day Barny's fears for the continuity of his *nor-aist coorse* were excited, as a larger brig hove in sight, and the nearer she approached, the more directly she came athwart Barny's course.

"May the divil sweep you," said Barny, "and will nothin' else sarve you than comin forninst me that-a-way. Brig-a-hoy there!!" shouted Barny, giving the tiller to one of his messmates, and standing at the bow of his boat. "Brig-a-hoy there!—bad luck to you; go 'long out o' my *nor-aist coorse*." The brig, instead of obeying his mandate, hove to, and lay right ahead of the hooker. "Oh look at this;" shouted Barny, and he stamped on the deck with rage—"look at the blackguards where they're stayin', just a-purpose to ruin an unfort'nate man like me. My heavy hathred to you; *quit* this minit, or I'll run down an yes; and if we go the bottom, we'll hant you

for ever more—go 'long out o' that, I tell you. The curse o' Crummil an you, you stupid vagabones, that wont go out iv a man's nor-aist coorse!!"

From cursing Barny went to praying as he came closer—"For the tendher marcy o' heavin, and leave my way. May the Lord reward you, and get out o' my nor-aist coorse! May angels make your bed in heavin, and do'nt ruinate me this-a-way." The brig was immoveable, and Barny gave up in despair, having cursed and prayed himself hoarse, and finished with a duet volley of prayers and curses together, apostrophising the hard case of a man being "*done out of his nor-aist coorse.*"

"A-hoy there!!" shouted a voice from the brig: "You're a small craft to be so far at sea. I suppose you have provision on board."

'To be sure we have; throth if we hadnt, this id be a bad place to go a beggin'."

"What have you eatable?"

"The finest o' scalpeens."

"What are scalpeens?"

"Why you're mighty ignorant intirely," said Barny; "why, scalpeens is pickled mackarel."

"Then you must give us some, for we have been out of every thing eatable these three days; and even pickled fish is better than nothing."

It chanced that the brig was a West India trader; that unfavourable winds had delayed much beyond the expected period of time on her voyage, and though her water had not failed, every thing eatable had been consumed, and the crew reduced almost to helplessness. In such a strait, the arrival of Barny O'Reirdon and his scalpeens was a most providential succour to them, and a lucky chance for Barny, for he got in exchange for his pickled fish a handsome return of rum and sugar, much more than equivalent to their value. Barny lamented much, however, that the brig was not bound for Ireland, that he might practise his own peculiar system of navigation; but as staying with the brig could do no good, he got himself put into his *nor-aist coorse* once more, and ploughed away towards home.

The disposal of his cargo was great good luck to Barny in more ways than one. In the first place, he found the most profitable market he could have had; and, secondly, it enabled him to cover his retreat from the difficulty which still was before him, of not getting to Fingal after all his dangers, and, consequently, being open to discovery and disgrace. All these beneficial results were not thrown away upon one of Barny's readiness to avail himself of every point in his favour; and, accordingly, when they left the brig, Barny said to his companions, "why thin boys, 'pon my conscience but I'm as proud as a horse wid a wooden leg this minit, that we met them poor unfort'nate craythers this blessed day, and was enabled to extind our charity to them. Sure an' it's lost they'd be only for our comin' acrass them, and we, through the blessin' o' God, enabled to do an act of marcy, that is, feedin' the hungry; and sure every good work we do here is before uz in heaven—and that's a comfort any how. To be sure, now that the scalpeens is sowld, there's no use in goin' to Fingal, and we may as well jist go home.—To the divil now wid Terry O'Sullivan, what does he know what's an iligant place? What knowledge has he of iligance? I'll go bail he never was half as far a navigatin' as we—he wint the short cut I go bail, and never daar'd for to vinture the round as I did."

Nothing particular occurred for the two succeeding days, during which time Barny most religiously pursued his *nor-aist coorse*, but the third day produced a new and important event. A sail was discovered on the horizon, and in the direction Barny was steering, and a couple of hours made him tolerably certain that the vessel in sight was an American; for though it is needless to say he was not very conversant in such matters, yet from the frequency of his seeing Americans trading to Ireland, his eye had become sufficiently accustomed to their lofty and tapering spars, and peculiar smartness of rig, to satisfy him that the ship before him was of transatlantic build: nor was he wrong in his conjecture.

Barny now determined on a manœuvre, classing him amongst the first tacticians at securing a good retreat. He calculated the American was bound for Ireland, and as she lay *almost* as directly in the way of his "nor-aist coorse," as the West Indian brig, he bore up to and spoke her.

He was answered by a shrewd Yankee captain.

"Faix an it's glad I am to see your honour agin," said Barny.

The Yankee had never been to Ireland, and told Barny so, and that a pilot was wanted for Cove.

"You know Cove?" said the American.

"Is it the Cove o' Cork why?"

"Yes."

"I was bred an' born there, and pilots as many ships into Cove as any other two min *out* of it."

Barny thus sheltered his falsehood under the idiom of his language.

"But what brought you so far out to sea?" asked the captain.

"We wor lyin' out lookin' for ships that wanted pilots, and there kem an the terriblest gale o' wind aff the land, an' blew us to say out intirely, an' that's the way iv it, your honour."

"I calculate we got a share of the same gale; 'twas from the nor-east."

"Oh, directly!" said Barny, "faith you're right enough, 'twas the *nor-aist coorse* we wor an sure enough; but no matther now that we've met wid you—sure we'll have a job home any how."

"Well, get aboard then," said the American.

"I will in a minit, your honour, whin I jist spake a word to my comrades here."

"Why sure it's not goin' to turn pilot you are?" said Jemmy, in his simplicity of heart.

"Whisht, you omadhaun!" said Barny, "or I'll cut the tongue out o' you. Now, mind me, Pether; you don't, undherstan' navigashin' and the various branches o' knowledge, an' so all you have to do is to follow the ship when I get into her, an' I'll show you the way home."

Barny then got aboard the American vessel, and begged of the captain, that as he had been out at sea so long, and had gone through "a power o' hardship intirely," that he would be permitted to go below and turn in to take a sleep, "for, in throth, its myself and sleep that is sthrayngers for some time," said Barny;" an' if your honour 'll be plazed, I'll be thankful if you won't let them disturb me until I'm wanted—for sure, till you see the land, there's no use for me in life, an' throth I want a sleep sorely."

Barny's request was granted, and it will not be wondered at, that after so much fatigue of mind and body, he slept profoundly for four and twenty hours. He then was called, for land was in sight; and when he came on deck, the captain rallied him upon the potency of his somniferous qualities, and "calculated" he had never met any one who could sleep "four and twenty hours on a stretch, before."

"Oh, Sir," said Barny, rubbing his eyes, which were still a little hazy, "whiniver *I* go to sleep, *I pay attintion to it.*"

The land was soon neared, and Barny put in charge of the ship, when he ascertained the first land mark he was acquainted with; but as soon as the Head of Kinsale hove in sight, Barny gave a "whoo," and cut a caper that astonished the Yankees, and was quite inexplicable to them, though, we flatter ourselves, it is not to those who do Barny the favour of reading his adventures.

"Oh! there you are, my darlint ould head! an' where's the head like you! throth its little I thought I'd ever set eyes an your good-looking faytures agin."

In such half-muttered exclamations did Barny apostrophise each well-known point of his native shore, and, when opposite the harbour of Kinsale, he spoke the hooker, that was somewhat astern, and ordered Jemmy and Peter to put in there, and tell Molly immediately that he was come back, and would be with her as soon as he could after piloting the ship into Cove.

The hooker put into Kinsale, and Barny sailed the ship into Cove. It was the first ship he ever had acted the pilot for, and his old luck attended him; no accident befel his charge, and, what was still more extraordinary, he made the American believe he was absolutely the most skilful pilot on the station. So Barny pocketed his pilot's fee, swore the Yankee was a gentleman, for which the republican did not thank him, wished him good bye, and then pushed his way home with what Barny swore was the easiest made money he ever had in his life. So Barny got himself paid for *piloting* the ship that *showed him the way home.**

* This admirable sketch of Irish character is abridged from the *Dublin University Magazine*, a work recently established, and is from the pen of SAMUEL LOVER, Esq. author of "Legends and Stories of Ireland."

A NIGHT ADVENTURE IN EGYPT.

EARLY in the year 1807, being at that time stationed in Sicily, the regiment to which I belonged was ordered to form part of a small expedition sent to Egypt under the command of General Mackenzie Frazer. Subsequent to the unfortunate affair at Rosetta, where Major-General Wauchope was killed, and where the army lost a great many men, the troops retreated to Alexandria, and the corps to which I belonged was chosen for the purpose of encamping on the sands of Aboukir, to watch the motions of the Turks—classic ground to every military man, where British soldiers, under the old and admirable Sir Ralph Abercromby, taught the boasted Invincibles of Napoleon a lesson which they never forgot—classic ground, too, to every British sailor, who, in the beautiful words of Campbell (substituting Nile for Baltic), might

> "Of Nelson and the Nile,
> Sing the glorious day's renown."

In that camp, where we remained several months, the event happened, which I relate as indicative of what may be expected by kindness even to the most savage animal. Soon after our encampment, we observed that large troops of wild dogs were in the habit of hovering round the camp, for the purpose of picking up whatever they could; however, they never during the day approached near the camp, but were generally to be seen in a small wood in its vicinity, and about the ruins of the old castle. A wild dog is about the size of a large shepherd's dog, generally of a dirty white colour, very strong limbs, large head with prick ears, something like a wolf's head, and, like him, "bony, and gaunt, and grim." One of these dogs (a female) had domesticated herself at the hospital tent, where the men fed her, and I also used to take her to my own tent frequently, and give her a breakfast. She remained with the regiment many years after our return to Sicily. One night, being the captain on duty, it was my business after twelve o'clock to visit all the guards and pickets in the neighbourhood of our camp. I was on horseback; and when about a quarter of a mile distant from the camp, my horse suddenly began to snort, and very soon stood still; nor could I, by use of heel and hand, induce him to go forward. I perceived approaching me, at the distance of thirty yards, something white, and, by an immediate attack, became aware that my enemy was a troop of these said wild dogs. I drew my sabre, and endeavoured to urge my horse forward, but he was immoveable. The dogs, to the number of eight or ten, kept a few yards in front of me, barking, and every now and then throwing themselves forward on their fore-legs, as if about to spring. I flourished my sabre, shouted to them, and kept a good front, as I knew if I allowed my horse to turn, they would fasten on him. I was suddenly surprised by seeing something pass from behind me with great rapidity, and in an instant after saw the foremost dog seized by another and thrown down; then another and another. I took advantage of the break in their line, dashed through, and quickly arrived at the picket I was going to visit. I found the men under arms, and the corporal said, he thought from the noise that the whole Turkish cavalry were in motion! When I was relating to the men the circumstance which had happened, my active ally made her appearance in the person of our hospital friend, who, I suppose, hearing the uproar, had come to the scene of action, and generously taken the side of the *few* against the *many*. Certainly, had it not been for my female canine auxiliary, I should have had the worst of the *tulzie*.

As some of the habits of the chameleon may not be generally known, I will take the liberty of mentioning a few of them, which came under my own observation. One morning, on my return from parade, I saw, close to my own tent, a very large chameleon *hanging* on a bush. I immediately secured him, and provided a box for him to repose in. In the course of a very few days he became quite familiar, and having seen them before, I knew how to gain his affections; which, in the first place, was done by *feeding* him well; and, in the next place, by scratching his back with a feather! I used to put him on my table at breakfast, and, in the course of a very few minutes, I have seen him devour at least fifty flies, catching them in the most dexterous manner with his long and slimy tongue; nor does he ever move from his position; but so sure as an unfortunate fly comes within reach, so sure is he caught, and with the rapidity of thought. In the forenoon I always gave him a large slice of water-melon, the whole of which he devoured; and he generally supped on as many flies as he could manage to entrap, setting at defiance all the "noble Hamlet's" theory of the chameleon's dish. *Promises* would not have suited him at all, being, at the end of each day, considerably more like a crammed capon than an air-fed chameleon.

It is not true that this animal will change *colour* according to what he is put on; but he *will* change *shade* according as he is pleased or displeased. His general hue is a bright green, with small gold spots over his body: he remains at this shade when he is highly pleased, by being in the sun, or being fed, or scratched, which he delights in: when angry (and he is very easily made so), his hue changes to a dusky green, almost to black, and the gold spots are not to be seen; but I never could perceive any other colour on his body but green, in a variety of shades; the spots enlarge very much when he is in good humour, so much indeed as to give a yellow tinge to the upper part of the animal; but in general they are merely little yellow spots here and there on the back and side. I carried him to Sicily, where he died, much regretted.

FREEMASONRY IN THE UNITED STATES.

IT is, we believe, not generally known in this country, that, within the last six years, a party has arisen in the United States of America, with the avowed object of excluding every freemason from public office. Resolved and stern, like the Covenanters of Scotland, this party has pursued its object with a pertinacity that seemed to acquire equal strength from success and defeat. It had its origin in a small town in the state of New York, with reference solely to a town election. Since that period it has drawn into its ranks nearly one hundred thousand free and intelligent electors of the state of New York; it has almost divided the vote of Pennsylvania; it has planted itself deeply in the soil of Massachusetts; it is spreading in other of the New England states, in Ohio, and elsewhere; while in Vermont, like the rod of Aaron, it has so far swallowed up former parties as to have obtained the control of the state government.

This most extraordinary party of fanatics—as is described by Mr Stone, in his work on the subject of Masonry,* and by a writer in the American Quarterly Review for September 1832, both of whose words we use—had its origin in a deliberate and great outrage, committed in the western part of the state of New York, against the peace of the people and the majesty of the laws. An extensive conspiracy was formed against a free citizen, commencing in his seizure and abduction, and ending in his murder. The name of the unhappy victim was William Morgan, a person whose failings, it would seem, were many, and among them was an avaricious disposition. His unsettled habits keeping him continually poor, and poverty rendering him petulant, he quarrelled with his masonic brethren, and avarice and revenge suggested to him a double gratification in publishing to the world the long-treasured secrets of freemasonry. The masons were soon apprised of his design, which occasioned them the greatest alarm. The terror of the threatened publication spread widely and rapidly; and various were the schemes, legal and illegal, to which the brotherhood resorted to frustrate it. On a false charge of petit larceny, and a perversion of the forms of law, Morgan was stolen from his family, transported, like a malefactor, one hundred and fifty miles through a populous country, and put to death by a gang of assassins, under circumstances of the most atrocious character.

Mr Stone thus relates the final catastrophe of the

* Letters on Masonry and Anti-Masonry, addressed to the Hon John Quincy Adams; by William L. Stone: New York. 1832

tragic event:—"On the 19th of September, eight masons, having finally determined to put their prisoner to death, believing, probably, that it would be safer to have a smaller number actually concerned in the execution, held a consultation as to the best mode of proceeding. The object was to select three of their number for executioners, and to have the other five excluded, and so excluded that neither should know who else, beside himself, was thus released, or who were the executioners. For this purpose, the following ingenious process was devised:—They placed eight tickets in a hat, upon three of which were written certain marks, and it was agreed that each one of their number should simultaneously draw a ticket. They were instantly to separate, before examining their tickets, and walk away in different directions, until entirely out of sight of each other. They were then to stop and examine the slip of paper they had drawn, and the five remaining blanks were to return to their own homes, taking different routes, by which means neither of them would know who had drawn the fatal numbers, and, of course, no one of the five could be a witness against the others! The three drawing the tickets which were marked, were to return to the magazine at a certain hour, and complete the design. The manner of his murder is believed to have been by attaching heavy weights to his body, and taking him out into the middle of the stream in a boat, where, at the dark hour of midnight, he was plunged into the torrent of the Niagara."

The horrible crime against humanity and the laws, which has here been set before us, was by no means discovered at once. The fact of the abduction and murder having been at length satisfactorily ascertained, the people of that section of country, labouring under a very honest feeling of indignation at the perpetration of such an outrage, set themselves about a thorough investigation of the transaction. But they soon found their investigations embarrassed, by freemasons, in every way that ingenuity could devise. The details of the case were only elicited by long and painful inquisition into circumstances, and, when elicited, the community was up in arms. The public feeling was naturally first excited in the village where Morgan had resided; but it soon extended itself far and wide, till it embraced a large part of the state of New York. The cry for justice was loud and deep, and the most vigorous measures were adopted in different sections for bringing the guilty to condign punishment. On the other hand, the conspirators, and, the Reviewer regrets to add, the masonic brotherhood in general, assumed the defensive. It plainly appeared that a systematic and determined combination existed to set at nought the power of the law. "At that time," continues Mr Stone, "by the then existing law of the state, grand jurors were selected and summoned by the sheriffs of counties. In one county, suspicion was strongly fastened upon the sheriff himself; and the grand jurors summoned by him refused to find bills, where the *ex parte* testimony was on all hands believed to be sufficient to put the offenders upon their trial. In some instances, where convictions were had for the lesser crime of abduction, the parties offending, so far from having been expelled from their respective lodges for their crimes, received aid and comfort from their brethren. In others, some witnesses stood mute; others were believed to have perjured themselves; while in other cases the masons on the petit juries would refuse to convict, even where the testimony was strong as proofs of holy writ. The arm of the law was raised, and the power and authority of the state invoked and exercised in vain; while the grand supervising bodies of the masonic institution were themselves strongly suspected of favouring the cause of the accused. The natural consequence of such a chain of circumstances was to increase the excitement of the people at every new developement of facts, and to chafe them into a yet more angry mood, with every successive disappointment. A large portion of the press, moreover, either observed an ominous silence, or attempted to heap ridicule upon those who honestly believed the blood of an innocent man to be crying from the ground for vengeance. Thus irritated and inflamed, the anti-masons no longer confined their denunciations to a few misguided masonic fanatics at the west, but proceeded, in no measured terms, to denounce the whole fraternity, and to hold the institution of freemasonary itself as directly responsible for the alleged murder. At one time it was said that the Grand Lodge, at another that the Grand Chapter, and at another that the General Grand Chapter, had directly authorized and required the murder of the victim."

The public are now made acquainted with the cause of the wide-spread hatred of freemasonry in the United States, which does injustice to an institution hitherto considered harmless. It is, nevertheless, evident, that the masonic institution has been corrupted and abused to an alarming and unprecedented extent among the citizens of the Union; and until it openly repel the accusations brought against it, and take effective measures to prevent the recurrence of such outrages by its members, it cannot well be countenanced by respectable members of society. In consideration that masonry altogether is fast losing its hold on the public mind—that its mixture of absurd fable, and puerile pretensions to some sublime mystery, its mechanical terms and symbols, its scenic representation, its appeals to the heart, and its antiquated principle of narrowing the circle of general philanthropy, are daily operating to reduce it to the character of a game for the amusement and attention of children—it would be useless to go into any regular animadversions on its history and character. We trust that the anti-masonic ferment created in the Union will speedily subside, and that the good sense of our transatlantic brethren will cause them to see the folly of proscribing, for the temporary misconduct of a few misguided fanatics, the whole of the members of an association, apparently as harmless as the infants whose amusements they seek to imitate.

SINGULAR INSTANCES OF SAGACITY IN SMELLING.

The blind man of Utrecht, mentioned by the Honourable Mr Boyle, and several other authors, is said to have been able to discover colours by feeling them: it is not less astonishing that several metals should be distinguished by smelling alone. The ancients mention various instances of this. Martial records a case of a person named Mamurra, who consulted nothing but his nose, to know if the copper that had been brought to him was of the true Corinthian. Some native Indian merchants have a still more exquisite sense of smell, for, according to the accounts of travellers in India, if a piece of money is given them, they only smell it, by which they are able to decide exactly its fineness, without touchstone, balance, or aquafortis: even if it be a piece of copper covered over with a leaf of silver, they discover the cheat in the same manner. It is said that the natives of many districts of India who abstain from the use of animal food, have an exquisite sense of smelling; so much so, that they have the power of detecting the particular spring from which the water is brought and offered to them for drink; and this water is quite inodorous to Europeans. The Indians have a word in their language which denotes a country of fine water. It has been related, that the negroes of the Antilles, by smell alone, can distinguish between the footsteps of a Frenchman and a negro. This, which at first might appear improbable, is not at all impossible, seeing how exquisite this sense is in many of the brute creation. We all know that dogs can trace the footsteps of their master, several hours after he has passed along a road: and it has been long established as an indisputable fact, that all our senses can be very much quickened by frequent exercise of them, as is frequently manifested in persons born blind or deaf. We shall illustrate this by one of the most striking examples on record, namely, that of an individual who was born both blind and deaf.

James Mitchell, the son of a clergyman lately deceased, in the county of Nairn, in Scotland, was born on the 11th November 1795. His mother soon noticed his blindness, from his discovering no desire to turn his eyes to the light, or to any bright object; and in early infancy she ascertained his deafness, from observing that the loudest noises did not disturb his sleep. He early showed an extraordinary acuteness of the senses of touch and smell. When a stranger arrived, his smell invariably informed him of the circumstance, and directed him to the place where a stranger was, whom he proceeded to survey by the sense of touch. In the remote situation where he resided, male visitors were most frequent; and, therefore, the first thing he generally did was to examine whether or not the stranger wore boots; if so, he immediately went to the lobby, felt for, and accurately examined the whip; then proceeded to the stable, and handled his horse with great care, and with the utmost seeming attention. To these various things he was guided by the senses of smell and touch alone.

From his childhood he had been accustomed to strike his fore-teeth with a key, or any instrument that gave a sharp sound. His chief gratification in this amusement was obviously derived from taste and smell. He found great amusement, also, in the exercise of touch, and often employed himself, for hours together, in gathering, from the bed of the river, round and smooth stones, which he afterwards arranged in a circular form, seating himself in the midst of the circle.

The information of his understanding, and the guidance of his conduct, seemed entirely to depend either on touch, or the organs of smell and taste. His docility and contrivance often indicated a degree of understanding which (if due allowance be made for his want of two of the most essential organs to man and animals—sight and hearing) was superior to that of many in whom every inlet is unobstructed through which the materials of knowledge enter the mind. He had received a severe wound in his foot, and during its cure he usually sat by the fireside, with his foot resting on a small footstool. More than a year afterwards, a servant boy with whom he used to play was obliged to confine himself at home from a similar cause. Young Mitchell, perceiving that his companion remained longer in one situation than he used to do, examined him attentively, and seemed quickly to discover, by the bandages on his feet, the reason of his confinement. He immediately walked up stairs to a garret, sought out, amid several other pieces of furniture, the little footstool on which he formerly supported his own wounded limb, brought it down in his hand to the kitchen, and gently placed the servant boy's foot upon it.

We have had in Europe some persons whose sense of smelling was equally delicate with those which we have mentioned among the natives of India. Marce Marci speaks of a monk at Prague, who, when any thing was given him, distinguished, by smelling, its qualities, and to whom it belonged, with as much certainty as the best-nosed dog. We ourselves knew an instance of an individual who could distinguish his own watch, from smelling, from that of other individuals, and could very readily detect with which hand any person opened the door of a room, by the smell left on it from the brass handle.

It was said of the above monk, that he could accurately distinguish, by this means, the virtuous from the vicious, and particularly the unchaste. We firmly believe in this, for we knew a lady of quality, who could distinguish, in this manner, when a certain gentleman had called at her house, even although she did not enter the room for more than an hour after his departure. We were forcibly struck with this on one occasion, when she could not possibly have known that he had paid a morning visit, as she was from home, and in quite an opposite direction, in an open carriage, and in which we accompanied her. The instant she entered the drawing-room, she said to her husband, "Mr —— has been calling," and immediately pulled up the window, before waiting for the affirmative; as he had really been calling, and had departed upwards of an hour before.

The monk whom we have above mentioned was much devoted to the study of natural philosophy; and, among other things, he had undertaken to instruct mankind, with precepts, on the sense of smelling, like those we have on optics and acoustics, by distributing, into certain classes, a great number of smells, to all which he had given names; but an untimely death cut him off in the midst of these curious researches.

The guides who accompany travellers in the route from Smyrna or Aleppo to Babylon, have no signs in the midst of the deserts to know the places they are in; yet they distinguish with certainty, even at midnight, at what distance they are from Babylon, by only smelling the sand. Perhaps they judge of the distance from the odour exhaled by the small plants or roots intermixed with the sand.

Physicians, in visiting the sick, even before they have seen them, frequently form opinions from certain prognostics, such as the cadaverous smell that often betrays itself on entering the chambers of the afflicted.

In the acts of Copenhagen, there are some curious instances mentioned of the power of smelling in animals. It has long been supposed that dogs can foretell the death of a sick person, which they do by long-continued howling. Many regard this as fabulous and superstitious, but several remarkable instances have been related by our friends; and some personal observations of our own have gone far to impress us with a belief in the capability of dogs being able to foresee approaching death.

The anonymous author says, "In this respect dogs are more sagacious than men, being attracted by the smell of death, and often seeming, before the patient has expired, to demand their prey by a continued howling. Whilst I lived at Ripen, which was seven years, I took notice of a little dog of a chestnut colour, that very often boded the death of sick persons, without being once mistaken. Every time he barked in the night, under the windows of any one whose sickness did not even appear dangerous, it happened infallibly that the sick person died within a few days. A lady of my acquaintance had a favourite monkey, and the monkey, in return for the kindness of his mistress, was so devotedly attached to her, that he would scarcely ever be induced to leave her. But his nice smell in distinguishing the approach of contagious distempers was very remarkable. The measles became epidemical in the country; the lady fell sick of them; and, what is very remarkable, she was abandoned by her favourite monkey some days before there was any indication of her approaching illness. From all the circumstances, there could be little doubt but he had a foreknowledge of this event from smell. No sooner, however, did she recover, than the monkey returned to her with the same fondness and familiarity which he used to manifest towards her before her malady. Some time afterwards, this lady had a slight fever, but without any appearance of malignity, and, what is curious, the monkey continued with her as a constant companion."

The following curious illustration of the sensibility of the dog, and his nice discrimination of smells, is related in Brown's Biographical Sketches and Anecdotes of Dogs, being an extract from the letter of an officer in Chile:—"A gentleman now residing in Turkey has a fine pointer, which he very greatly values, and which is a constant attendant on him. Stepping into a public assembly about three years ago with this gentleman, we paid our respects to a certain noted Baronet, whose whole carcase is a corrupted mass of distempers. Hector immediately made up to the same corner of the room, and for two or three moments with great briskness snuffed about the hero's garments, and then, with a mortified look, taking two or three traverses round the apartment, he hung his ears, and, with his tail between his legs, fairly scampered down stairs, notwithstanding the repeated calls we made after him. As I always regarded the actions of this animal as somewhat above common instinct—for he is a remarkably cunning creature—this immediately struck me, and I ran down after him, when I found him drinking out of the gutter that ran from a pump before the door. Having finished this, he rolled himself in the dust two or three times, gave some yelps, and quietly laid himself before the

threshold, to wait our coming out; nor could all my entreaties or menaces get him in again. Is there any thing surprising in this? No: the gentleman was grown so nauseous, that even a brute could not endure him, and was forced to use methods to get rid of the *haut-gout* even after he had left him. Indeed, we, more complacent than honest Hector, stood the whole disagreeable perfume, at the expense of sickened stomachs, to preserve the appearance of good manners."

The above curious fact upsets a theory of Buffon, and which was followed by Goldsmith, who says, "Dogs not only trace the steps of other animals, but also discover them by the scent at a very great distance; and while they are thus exquisitely sensible of all smells, *they seem no way disgusted* by any." To ascertain the value of this remark, we have ourselves tried the effect of disagreeable odours on dogs, and, in the case of assafœtida, we have found that it produced great disgust, and they would run off, shaking their heads, and discovering strong marks of experiencing disagreeable sensations.

The sense of smelling is one from which we enjoy many pleasurable sensations; at the same time, it not unfrequently gives us false intelligence. Many things that have a disagreeable odour, are, nevertheless, wholesome, and pleasant to the taste; and it frequently happens that those epicures who convert eating into an art, seldom think a meal fit to please the appetite till it is offensive to their olfactory nerves. On the other hand, there are many substances which have a grateful smell, and yet are most deleterious to the constitution; indeed, this is almost universally the case with poisons. For example, the Manchineel apple, which is well known as a deadly poison, sends forth the most delicious odour; the prussic acid has the agreeable flavour of nuts, and two or three drops of it taken into the stomach produce instant death. Some of the mineral vapours, such as the choke-damp of mines, smell like the blossoms of sweet peas, prove fatal when inhaled, and thus "continue to flatter till they destroy." These facts prove, that, in man at least, this sense was never given to him by the disposer of all things to direct him to the choice of his food, but appears to have been provided rather as an attendant than as a necessary pleasure: while, in the lower animals, there seems to be every reason for supposing that it has been constituted to enable them to detect that which is good for food, and that which is poisonous; at the same time, we are aware that many mistakes of instinct occur even in them respecting their olfactory sense.

The pleasure which different individuals experience from various odours, often depends on an acquired taste; and we find this in a greater or lesser degree national. The Turks, Persians, and Arabians, delight in the effluvia of opium, which to European taste is most disgusting. The natives of Continental Europe, whether male or female, have long had a fondness for tobacco smoke, which, comparatively speaking, is yet but little relished in Britain by men, while it is held in utter abhorrence among females.

On the other hand, if we examine the inhabitants even of the same country, we shall find great diversity of opinion as to the pleasure they derive from the sense of smelling. Some persons are delighted with the smell of a rose, while others cannot endure it. We knew an instance of a person who fainted whenever subjected to the smell of celery, and another who took a headache whenever she sat near a pine-apple at table. Some savage nations experience high gratification at the smell of assafœtida, which Europeans consider the most nauseous smell in nature. It would thus appear that much of our gratification in the use of perfumes and different odours is dependent upon habit; and as a strong proof of this, we knew a person who had the greatest possible dislike to the smell of celery and cucumbers; but seeing these so much relished by most people with whom he mingled in society, he determined, if possible, to conquer his aversion to them. For the former vegetable he has acquired a rapacious fondness, but for the latter, he still continues to dislike it. Hence it would appear that most of our perceptions of odours could be inverted by a little industry.

There is one curious fact regarding some odours, which is, that many substances, which at certain distances are an agreeable perfume, when nearer, are a most ungrateful odour. Musk, for example, in small quantity, or a weak tincture of it, is considered by most persons as highly fragrant, and yet, when in larger masses, its scent is insufferable, producing violent headaches, nausea, and vomiting. We on one occasion suffered severely from having put a small bit of musk into our waistcoat pocket on a fine summer day. The heat caused the musk to evaporate, and occasioned excessive sickness and nausea, and for weeks afterwards we could not divest ourselves of the idea of smelling the musk, although our waistcoat had been washed and bleached, and, indeed, not afterwards worn for some time.

To those of our readers who are unacquainted with the construction of the organ of smell, we shall give a short account of it.

The organ of smell is a soft, vascular, porous membrane, furnished with papillæ or small dots, which are spread on the internal surface of the nostrils. On this membrane are distributed a great number of nervous fibres, which proceed chiefly from the first pair of nerves, and which pass through the ethmoid bone. From the extreme tenuity of the epidermis, or skin which covers the nerves and blood-vessels in this membrane, hemorrhage or bleeding from the nose is more frequent than from any other part of the body.

In order to render the sense of smell more acute, the internal cavity of the nose is variously contorted and enlarged by a communication with several adjoining cavities, so as to increase very much the surface on which the sentient membrane is distributed.

The cavities with which the nostril communicates are called sinuses; these are, the frontal, which is situated in the frontal bone, under the eye-brows; the ethmoid, which is a spongy cavity in the ethmoid bone; and the maxillary, which is chiefly formed in the maxillary bone, and lies immediately above the double teeth in the upper jaw.

In animals which smell more acutely, these provisions for enlarging the internal surface of the nostril are still more remarkable.

The membrane of the nose is defended and moistened by a viscid mucus; and so necessary is this to smelling, that when it is deficient, the sense is always imperfect. The nostrils are furnished with muscles, by which they are dilated, when, in order to distinguish scents more acutely, we draw in a large quantity of air. A considerable difference betwixt smelling and tasting is, that the former is only acted on by the invisible effluvia of bodies which float in the air; the latter, by matter more condensed and visible. There seems, however, to be a greater similitude between tasting and smelling than between any two of the other senses; and when either of them is injured, the other commonly suffers with it.

THE BIRD OF WASHINGTON.

[BY AUDUBON.]

It was in the month of February 1814, that I obtained the first sight of this noble bird, and never shall I forget the delight which it gave me. Not even Herschel, when he discovered the planet which bears his name, could have experienced more rapturous feelings. We were on a trading voyage, ascending the Upper Mississippi. The keen wintry blasts whistled around us, and the cold from which I suffered had, in a great degree, extinguished the deep interest which, at other seasons, this magnificent river has been wont to awake in me. I lay stretched beside our patroon. The safety of the cargo was forgotten, and the only thing that called my attention was the multitude of ducks, of different species, accompanied by vast flocks of swans, which from time to time passed us. My patroon, a Canadian, had been engaged many years in the fur trade. He was a man of much intelligence, and, perceiving that these birds had engaged my curiosity, seemed anxious to find some new object to divert me. An eagle flew over us. "How fortunate!" he exclaimed; "this is what I could have wished. Look, sir! the Great Eagle, and the only one I have seen since I left the lakes." I was instantly on my feet, and having observed it attentively, concluded, as I lost it in the distance, that it was a species quite new to me. My patroon assured me that such birds were indeed rare; that they sometimes followed the hunters, to feed on the entrails of animals which they had killed, when the lakes were frozen over, but that when the lakes were open, they would dive in the day-time after fish, and snatch them up in the manner of the Fishing Hawk; and that they roosted generally on the shelves of the rocks, where they built their nests, of which he had discovered several by the quantity of white dung scattered below.

Convinced that the bird was unknown to naturalists, I felt particularly anxious to learn its habits, and to discover in what particulars it differed from the rest of its genus. My next meeting with this bird was a few years afterwards, whilst engaged in collecting crayfish on one of those flats which border and divide Green River, in Kentucky, near its junction with the Ohio. The river is there bordered by a range of high cliffs, which, for some distance, follow its windings. I observed on the rocks, which, at that place, are nearly perpendicular, a quantity of white ordure, which I attributed to owls that might have resorted thither. I mentioned the circumstance to my companions, when one of them, who lived within a mile and a half of the place, told me it was from the nest of the Brown Eagle, meaning the White-headed Eagle (*Falco leucocephalus*) in its immature state. I assured him this could not be, and remarked that neither the old nor the young birds of that species ever build in such places, but always in trees. Although he could not answer my objection, he stoutly maintained that a brown eagle of some kind, above the usual size, had built there; and added, that he had espied the nest some days before, and had seen one of the old birds dive and catch a fish. This he thought strange, having, till then, always observed that both Brown Eagles and Bald Eagles procured this kind of food by robbing the fish-hawks. He said that if I felt particularly anxious to know what nest it was, I might soon satisfy myself, as the old birds would come and feed their young with fish, for he had seen them do so before.

In high expectation, I seated myself about a hundred yards from the foot of the rock. Never did time pass more slowly. I could not help betraying the most impatient curiosity, for my hopes whispered it was a Sea Eagle's nest. Two long hours had elapsed before the old bird made his appearance, which was announced to us by the loud hissings of the two young ones, which crawled to the extremity of the hole to receive a fine fish. I had a perfect view of this noble bird as he held himself to the edging rock, hanging like the Barn, Bank, or Social Swallow, his tail spread, and his wings partly so. I trembled lest a word should escape from my companions. The slightest murmur had been treason from them. They entered into my feelings, and, although little interested, gazed with me. In a few minutes the other parent joined her mate, and from the difference in size (the female of rapacious birds being much larger), we knew this to be the mother bird. She also had brought a fish; but more cautious than her mate, she glanced her quick and piercing eye around, and instantly perceived that her abode had been discovered. She dropped her prey, with a loud shriek communicated the alarm to the male, and, hovering with him over our heads, kept up a growling cry, to intimidate us from our suspected design. This watchful solicitude I have ever found peculiar to the female:—must I be understood to speak only of birds?

The young having concealed themselves, we went and picked up the fish which the mother had let fall. It was a white perch, weighing about 5½ lb. The upper part of the head was broken in, and the back torn by the talons of the eagle. We had plainly seen her bearing it in the manner of the Fish-Hawk.

This day's sport being at an end, as we journeyed homewards, we agreed to return the next morning, with the view of obtaining both the old and young birds; but rainy and tempestuous weather setting in, it became necessary to defer the expedition till the third day following, when, with guns and men all in readiness, we reached the rock. Some posted themselves at the foot, others upon it, but in vain. We passed the entire day, without either seeing or hearing an eagle, the sagacious birds, no doubt, having anticipated an invasion, and removed their young to new quarters.

I come at last to the day which I had so often and so ardently desired. Two years had gone by since the discovery of the nest, in fruitless excursions; but my wishes were no longer to remain ungratified. In returning from the little village of Henderson, to the house of Dr Rankin, about a mile distant, I saw an eagle rise from a small enclosure not a hundred yards before me, where the Doctor had a few days before slaughtered some hogs, and alight upon a low tree branching over the road. I prepared my double-barrelled piece, which I constantly carry, and went slowly and cautiously towards him. Quite fearlessly he awaited my approach, looking upon me with undaunted eye. I fired, and he fell. Before I reached him, he was dead. With what delight did I survey the magnificent bird! Had the finest salmon ever pleased him as he did me?—Never. I ran and presented him to my friend, with a pride which they alone can feel, who, like me, have devoted themselves from their earliest childhood to such pursuits, and who have derived from them their first pleasures. To others I must seem to "prattle out of fashion." The Doctor, who was an experienced hunter, examined the bird with much satisfaction, and frankly acknowledged he had never before seen or heard of it.

The name which I have chosen for this new species of Eagle, "The Bird of Washington," may, by some, be considered as preposterous and unfit; but as it is indisputably the noblest bird of its genus that has yet been discovered in the United States, I trust I shall be allowed to honour it with the name of one yet nobler, who was the saviour of his country, and whose name will ever be dear to it. To those who may be curious to know my reasons, I can only say, that, as the new world gave me birth and liberty, the great man who ensured its independence is next to my heart. He had a nobility of mind, and a generosity of soul, such as are seldom possessed. He was brave, so is the eagle; like it, too, he was the terror of his foes; and his fame, extending from pole to pole, resembles the majestic soarings of the mightiest of the feathered tribe. If America has reason to be proud of her Washington, so has she to be proud of her Great Eagle.

In the month of January following, I saw a pair of these eagles flying over the Falls of the Ohio, one in pursuit of the other. The next day I saw them again. The female had relaxed her severity, had laid aside her coyness, and to a favourite tree they continually resorted. I pursued them unsuccessfully for several days, when they forsook the place.

The flight of this bird is very different from that of the White-headed Eagle. The former encircles a greater space, whilst sailing keeps nearer to the land and the surface of the water, and when about to dive for fish, falls in a spiral manner, as if with the intention of checking any retreating movement which its prey might attempt, darting upon it only when a few yards distant. The Fish-Hawk often does the same. When rising with a fish, the Bird of Washington flies to a considerable distance, forming, in its line of course, a very acute angle with the surface line of the water. My last opportunity of seeing this bird was on the 15th of November 1821, a few miles above the mouth of the Ohio, when two passed over our boat, moving down the river with a gentle motion. In a letter from a kind relative, Mr W. Bakewell, dated "Falls of the Ohio, July 1819," and containing particulars relative to the Swallow-tailed Hawk, that gentleman says:—"Yesterday, for the first time, I had an opportunity of viewing one of those magnificent birds, which you call the Sea Eagle, as it passed

low over me, whilst fishing. I shall be really glad when I can again have the pleasure of seeing your drawing of it."

All circumstances duly considered, the Bird of Washington, which is three feet in length, and six feet nine inches in extent of the wings, stands forth as the champion of America, *sui speciei*, and henceforth not to be confounded with any of its rivals or relatives. If ornithologists are proud of describing new species, I may be allowed to express some degree of pleasure in giving to the world the knowledge of so majestic a bird.—*American Ornithology.*

LITERARY HISTORY OF THE BIBLE.

ANCIENT VERSIONS.

ORIGINALLY there was but one version of the Scriptures; but a schism of a remarkable nature which broke out between the Jews and the Samaritans, was the cause of producing another version; and of this, and those which followed, we are now about to speak. The Second Book of Kings furnishes us with the history of this schism, which, it will be recollected, was caused by the setting up of certain golden calves to be worshipped at Dan, in Bethel, by Jeroboam. Omri hence built Samaria, and made it the capital of his kingdom, and thus was the separation between Judah and Israel rendered complete. Samaria was, at first, only the name of a city, but afterwards it became that of a province. It contained the tribe of Ephraim, and the half-tribe of Manasseh, which was on this side Jordan; so that it was to the north of Judea, and between the Great Sea, Galilee, and Jordan; and there was, therefore, no going from Galilee to Jerusalem without passing through this province. The capital of the district, subsequent to the captivity, was Sichem, afterwards called Neapolis or Naplous, which was situated between the mountains Gerizim and Ebal.

In the reign of Hezekiah, king of Judah, Samaria was taken by Shalmanezer, and the ten tribes were carried into captivity. Some years after, Esarhaddon sent the Cutheans to supply the place of the Jews, and to inhabit Samaria; and these people, who knew not the true God, but continued their idolatrous practices, and burnt their children in the fire to *Moloch*, were punished for their idolatry with lions, which made great havoc amongst them. For this reason, at their request, Esarhaddon sent some of those priests who had been carried into captivity, to instruct them, and teach them the worship of the true God. They did not embrace it with purity, however, but mixed the remains of paganism with their religion; for which reason, in the writings of the Jewish Rabbies, they are denominated, in scorn, *The proselytes of the lions*, because it was through fear of them that they mixed the worship of the Creator with that of their idols. Nevertheless, when Manasses, the son of Jaddus the high priest of the Jews, had built the temple on Mount *Gerizim*, the Samaritans then retained their old superstitions no longer, but always contended that their temple was more holy than that of Jerusalem; inferring, from the *ark's* having been a long time at Shiloh, near *Ephraim*, that the worship of God had rather begun in their country than in Jerusalem. According to Josephus, they claimed kindred with the Jews in their prosperity, but renounced all connection with them when they were under persecution. From John's Gospel we learn, that when the Messiah was on earth, the Samaritans, who received no part of the Old Testament except the Pentateuch, had lost all tradition of the revolt and subsequent captivity of the ten tribes; they considered themselves descended from the stock of Israel, claimed Jacob for their father, and contended that the *Holy Mountain* was in the portion assigned to them by Joshua.

There was no particular enmity between the two nations until the time of Ezra. Incensed by the opposition they gave to the building of the temple, from the time their assistance was refused, he is said to have solemnly excommunicated them; and hence arose that enmity, which was carried to such a height that "the Jews had no dealings with the Samaritans;" and, from Ezra's time, Samaria became a refuge for the malcontent Jews. Ptolemy Lagos carried numbers, both of the Samaritans and of the Jews, into Egypt, where a fierce contest took place between them respecting the sanctity of their temples, each party insisting that theirs stood on the Holy Mount. The point was discussed publicly in presence of the king, and the Samaritan advocates, failing in their proof, were put to death. In the year 109 before Christ, John Hyrcanus destroyed the city and temple of the Samaritans, and, though afterwards, viz. in the year 25 before Christ, King Herod built them a city and temple, they still continued to worship on Mount Gerizim. In the twelfth century, Benjamin of Tudela found some remains of these people in that country, where they are still to be found. During the revolt of the Jews, the Samaritans continued in their subjection to the Romans; and since that period, they have always remained subject to the different powers who have been in possession of that and the neighbouring countries.

It is supposed that the present Hebrew character was first adopted from the Chaldeans by Ezra, at the time when, after the return of the Jews from Babylon, he collected the Scriptures, and formed the entire canon. As the people were familiarised with the Chaldee, he used that character in transcribing the Old Testament. What is now called the *Samaritan*, was the character used by Moses and the Prophets; and Ezra relinquished it to the Samaritans, it is said, in order to render the separation between them and the Jews more complete. Since that time, the Jews have used the characters we call the Hebrew, and the Samaritans have retained the others.

The value of the Samaritan Pentateuch is very great; for, where its text accords with the Hebrew text, it confirms it most decidedly; because, as the Jews and Samaritans were such inveterate enemies, there never could have been any designed corruption effected by them both. It frequently confirms, and sometimes corrects, the reading of the Hebrew in important places; and it overturns all that system of Rabbinical trifling, by which mysterious knowledge is said to be communicated through the shape and position of certain letters, or certain words, which they pretend Moses learned from God, because such things cannot be applied to its characters.

As the Samaritans do not understand the Hebrew text, although in the character of their own language, they have found it necessary to translate it for common use. For, as the Jews, after the Babylonish captivity, degenerated in their language from the Hebrew to the Babylonish dialect, so the Samaritans did the same, most probably by bringing this dialect out of Assyria with them, when they first came to plant in Samaria. Therefore, as the Jews, for the sake of the vulgar among them who understood only the common language, were forced to make Chaldee versions of the Scripture, which they call Targums, so the Samaritans, for the same reason, were obliged to do the same thing, and to make a version of their Pentateuch into the vulgar Samaritan, which is, most probably, the most ancient translation of the Bible in existence. This Samaritan version is not made, like the Chaldee versions among the Jews, by way of paraphrase, but by an exact rendering of the text word for word, for the most part without any variation. Being perfectly literal, the same Latin translation answers both to it and the Samaritan Pentateuch; and all the three are published in the Paris and London Polyglotts.

There were two causes which chiefly conduced to render the Greek language, at one time, of almost universal use in the world. The first cause was the conquests of Alexander the Great, who was, by nation, a Grecian, king of Macedon, and afterwards ruler of the greater part of the then known world. His vast empire, although divided, yet subsisted for a great length of time, as his officers divided it among themselves, and reigned in different countries, so that the Greeks still continued to have dominion in the world, particulary the Seleucidæ, in Syria, and the Ptolemies, in Egypt, by which means the Greek language became known and in use, both in Judea and Egypt. The other cause of the extent of this language, was the high reputation the Greeks had acquired for learning and wisdom, which made many people desirous of knowing their language, who were not subject to their dominion.

This, then, was the language which was made use of to give the Gentiles the first knowledge of the Messiah. The Greek version of the Old Testament prepared the way for the gospel. The Gentiles read in these books the prophecies which the Apostles showed had been accomplished in Jesus Christ; and they found, also, that the obstinate incredulity of the Jews had been foretold in them. They could not suspect the fidelity of the Apostles, because this version of the Scriptures had not been made by them; nor could they accuse the Jews of having altered these books, because, as they were, the Jews were condemned in them. Besides, the time at which it was made gave this translation of the Bible a prodigious deal of weight; because, from its having appeared before the birth of Jesus Christ, neither Pagans nor Jews could say that the ancient prophecies therein contained had been adapted to the circumstances of his life.

Whoever were the authors of this the first translation of the Scriptures into Greek, commonly known by the name of the SEVENTY, or the SEPTUAGINT, and of which the Jewish historians, Philo and Josephus, have spoken much, no one doubts that it was made long before the time of Jesus Christ; and it is of great authority. Several passages of the Old Testament, which are quoted in the New, are taken from thence; and, being thus noticed by the writers of the New Testament, from their mode of using it, we may infer that it was in general circulation among the Apostolic churches. All the other ancient versions, likewise, which were publicly read in the different churches of the world, the *Arabic*, the *Ethiopic*, the *Armenian*, the *Gothic*, the *Illyrican*, and the ancient *Latin*, which was in use before St Jerome's time, were made from it; and, in short, every one of them, except the *Syriac*, were made from that of the SEVENTY, and to this day the Greek church, and the churches of the east, have no other. It is this version that the Fathers and Doctors of the church have explained, and commented upon. It was from this version that they drew their decisions in matters of faith, and their precepts of morality. It was by this that they confuted heresies, and both general and particular councils explained themselves by it. Thus, whoever the authors of it were, its authority is great; and that upon this account only, if no other, that it was made at a time when the *Hebrew* was a living language, and, consequently, more easy to be understood than it is now, when it is almost impossible to come at the true understanding of it, otherwise than by the assistance of the ancient versions. For these reasons, we shall turn our attention, somewhat particularly, to the history of this celebrated version.

Alexander the Great, on his building of the city of Alexandria, in Egypt, brought a great many Jews thither to help to plant the new city; and Ptolemy Soter, after his death, having fixed the seat of his government there, and set his heart much upon the enlarging and adorning of it, brought thither many more of this nation for the same purpose; where, having granted to them the same privileges with the Macedonians and other Greeks, they soon grew to be a great part of the inhabitants of that city. Their continual intercourse with the other citizens, among whom they were there mingled, having obliged them to learn and constantly use the Greek language, the same happened to them here, as had happened to them before at Babylon; that is, by accustoming themselves to a foreign language, they forgot their own. Hence, from their no longer understanding the Hebrew language, in which the Scriptures had been hitherto first read, nor the Chaldee, in which they were after that interpreted in every synagogue, they got them translated into Greek for their own use, that this version might serve for the same purpose in Alexandria and Egypt, as the Chaldee paraphrases afterwards did in Jerusalem and Judea.

After the time of Ezra, the Scriptures were read to the Jews in Hebrew, and interpreted into the Chaldee language; but at Alexandria, after the writing of this version, it was interpreted to them in Greek, which was afterwards done also in all other Grecian cities where the Jews became dispersed.

There are several opinions which modern writers have entertained respecting the origin of the Septuagint version, but the commonly received opinion is that entertained by Bishop Walton, the author of the London Polyglott, and is the same which is given in a historical account of the transaction, as related by a Hellenistic Jew, who flourished in the time of Ptolemy Philadelphus, king of Egypt. The account of the affair, as contained in a book written by the person above mentioned, whose name was Aristeas, is as follows:—

King Ptolemy Philadelphus, having, by the advice of Demetrius Phalereus, caused a magnificent library to be erected at Alexandria, and given him the direction of it, this philosopher spoke to him of the sacred books of the Jews, as of a work which would do honour to his library. The prince, therefore, resolved to have a copy of the Jewish law translated into Greek, his own language, and that which was then universally understood. For this purpose he sent ambassadors to Jerusalem, to Eleazer, the high priest, with magnificent presents for the temple. Their instructions were, to desire him to give the king a copy of the sacred books, and to send him some persons of distinction and learning, who might translate them into Greek. Aristeas, who was a chief officer in the king's guards, and a chief man in the kingdom of Egypt, was of this embassy; and Eleazer, who received him with honour, was, according to Josephus, the son of Onias the First, the brother of Simon the Just, who is mentioned in the Apocryphal book called Ecclesiasticus, and grandson to Jaddus, who went to meet Alexander the Great, and made him confer favourable terms upon the Jews.

The high priest consulted with the great council of the nation, called the Sanhedrim, in regard to Ptolemy's request, and afterwards chose six men out of each tribe—seventy-two in all—gave them a copy of the law, written in letters of gold, upon skins curiously fastened together, and sent them into Egypt. The king received them favourably, and showed a great deal of respect for the divine books; he then assigned them a residence in the Isle of Pharos, about seven furlongs distant from Alexandria, where they completed the version in seventy-two days. Demetrius caused it to be read publicly in the presence of the priests, great men, and all the Jews, who were then very numerous at Alexandria, and it was universally applauded; they cried out, with one voice, that the translation was just and faithful; and, in order to render it not only authentic, but also unalterable, they made imprecations against those who should attempt to make any alteration in it. When it was read to the king, he admired the wisdom of the Lawgiver, and commanded the books to be deposited in his library, allowing copies to be taken for the use of the Jews: he then sent back the seventy-two elders, after having made them some rich presents. The most magnificent of these presents was the freeing of one hundred and twenty thousand Jewish captives, whose ransom he paid, and gave them liberty to return into Judea. This version soon became common among all the Jews who spoke the Greek language, and was read publicly in their synagogues. It is not accurately ascertained in what year all this took place: Walton thinks the opinion, which fixes it in the 7th of Ptolemy, and the 278th before Christ, the most probable.

CASES OF MONOMANIA.

Not many years since I dined with a friend, a man of distinguished abilities. There were other guests at table; our host was well, and in full performance of his intellectual manifestations, when on a sudden he was noticed to give signs of salutation to the door of the room; he welcomed an unseen friend, arose, and handed him a chair, addressed him, received his answers, and maintained the supposed conversation. This gentleman, next day, was completely free from the strange hallucination. The second example is one which I shall quote on indisputable authority. It is the history of the epidemic monomania of St Souard, and never was there a history more curious and extraordinary. A battalion of French soldiers, during the toils and dangers of a campaign, were marching on a certain point, on a hot and overcoming day, and at double the usual speed. Their strength was eight hundred men, all hardy, seasoned, and courageous men, careless of danger, despising the devil, and little occupied with the thoughts of ghosts and phantasmagoria. On the night of the occurrence in question, the battalion was forced to occupy a narrow and low building, barely calculated to accommodate three hundred persons. Nevertheless they slept; but at midnight one and all were roused by frightful screams issuing from all quarters of the house, and to the eyes of the astonished affrighted soldiers appeared the vision of a huge dog, which bounded in through the window, and rushed with extraordinary heaviness and speed over the breasts of the spectators. The soldiers quitted the building in terror. Next night, by the solicitations of the surgeon and chef de battaillon, who accompanied them, they again resumed their previous quarters. "We saw," says the narrator, "that they slept; wide awake we watched the arrival of the hour of the preceding panic, and midnight had scarcely struck, when the veteran soldiers, for the second time, started to their feet; again they had heard the supernatural voices, again the visionary hound had bestrode them to suffocation; the chef de battaillon and myself heard or saw nothing of these events." Here, gentlemen, is a curious fact, and it is perhaps more worthy of attention as it seems to point out the special operation of physical causes in the production of the monomania and in the direction of the delusion towards the organs, namely, those of respiration, which had chiefly suffered in the previous marches, and in the suffocating atmosphere of the den in which they slept. The last example I shall give you, gentlemen, occurred in my own person (laughter), and yet I believe that I was not mad, at least I was not so at the time when the circumstance happened. (Increased laughter.) I was but a very young man, when one day I made my first visit to a dissecting-room, that of La Pitié, and there I saw the body of a child, in an advanced state of putrefaction, all covered with larvæ and worms. I returned home, not caring much about the matter, went to bed, and slept soundly. But when I arose in the morning, and was crossing the room to open my window, judge my astonishment to see lying on my table the very body I saw yesterday at La Pitié. I started, rubbed my eyes, shook myself, all in vain; there it was, blue, and green, and putrid, and full of creeping worms. Never was any thing more distinctly seen; nevertheless, the delusion soon vanished and I recovered my reason (a laugh), which, I am glad to say, has since been undisturbed by any such visionary spectres.—*M. Andral's Lectures in the Lancet.*

CROMWELL.

The following tradition, concerning Cromwell, is preserved by an uncommonly direct line of traditional evidence, being narrated by the grandson of an eyewitness:—When Cromwell, in 1650, entered Glasgow, he attended divine service in the High Church; but the Presbyterian divine who officiated, poured forth, with more zeal than prudence, the vial of his indignation upon the person, principles, and cause of the independent general. One of Cromwell's officers rose and whispered his commander, who seemed to give him a short and stern answer, and the sermon was concluded without interruption. Among the crowd who were assembled to gaze at the general as he came out of the church, was a shoemaker, the son of one of James the Sixth's footmen. This man had been born and bred in England, but, after his father's death, had settled in Glasgow. Cromwell eyed him among the crowd, and immediately called him by his name; the man fled, but, at Cromwell's command, one of his retinue followed him, and brought him to the general's lodgings. A number of the inhabitants remained at the door, waiting the end of this extraordinary scene. The shoemaker soon came out in high spirits, and, showing some gold, declared he was going to drink Cromwell's health. Many attended him to receive the particulars of his interview; among others, the grandfather of the narrator. The shoemaker said he had been a playfellow of Cromwell's when they were both boys, their parents residing in the same street; that he had fled when the general first called to him, thinking he might owe him some ill will, on account of his father being in the service of the royal family. He added, that Cromwell had been so very kind and familiar with him, that he ventured to ask him what the officer had said to him in the church. "He proposed," said Cromwell, "to pull forth the minister by the ears, and I answered, that the preacher was one fool, and he another." In the course of the day, Cromwell held an interview with the minister, and contrived to satisfy his scruples so effectually, that the evening discourse, by the same man, was tuned to the praise and glory of the victor of Naseby.

REMARKABLE ANECDOTE.

The particulars of the following very striking incident were lately told us by a friend, as a fact falling within the range of his personal knowledge; and having the most perfect confidence in his veracity, we scruple not to give it as such to our readers:—In a sea-port town on the west coast of England, some years ago, there was notice given of a sermon to be preached one Sunday evening, in a dissenting chapel there. The preacher was a man of great celebrity in his calling; and that circumstance, together with the pious object of the discourse—to enforce the duty of a strict observance of the Sabbath—attracted an overflowing audience. After the usual prefatory prayer and hymn of praise, the preacher gave out the text, and was about to proceed with his sermon, when he suddenly paused, leant his head on the pulpit, and remained silent for a few moments. It was imagined that he had become indisposed; but he soon recovered himself, and, addressing the congregation, said, that before entering upon his discourse, he begged to narrate to them a short anecdote. "It is now exactly fifteen years," said he, "since I was last within this place of worship; and the occasion was, as many here may probably remember, the very same as that which has now brought us together. Amongst those who came thither that evening, were three dissolute young men, who came not only with the intent of insulting and mocking the venerable pastor, but even with stones in their pockets to throw at him as he stood in this pulpit. Accordingly, they had not listened long to the discourse, when one of them said impatiently, 'Why need we listen any longer to the blockhead?—throw!' but the second stopped him, saying, 'Let us first see what he makes of this point.' The curiosity of the latter was no sooner satisfied, than he, too, said, 'Ay, confound him, it is only as I expected—throw now!' But here the third interposed, and said it would be better altogether to give up the design which had brought them there. At this remark his two associates took offence, and left the church, while he himself remained to the end. Now, mark, my brethren," continued the preacher, with much emotion, "what were afterwards the several fates of these young men? The first was hanged, many years ago, at Tyburn, for the crime of forgery; the second is now lying under sentence of death for murder in the jail of this city. The third, my brethren"—and the speaker's agitation here became excessive, while he paused, and wiped the large drops from his brow—"the third, my brethren, *is he who is now about to address you—listen to him!*"

MAXWELL'S CROSS.

In the parish of Kirkpatrick-Fleming, in Dumfriesshire, there exists, or lately existed, a stone pillar or cross, erected to commemorate the circumstance of a treacherous murder. Tradition makes us acquainted with the nature of the event, which took place as follows:—

In 1483, the Duke of Albany and the Earl of Douglas, who for some time had been exiles in England, wishing to learn the dispositions of their countrymen towards them, made an incursion into their native country, went to Lochmaben, and plundered the market there. In the meantime, a master of Maxwell, son of Baron Maxwell of Caerlaverock, upon whom the wardenship of the borders had devolved, in consequence of his father's imprisonment in England, receiving intelligence of this affair, assembled his friends and dependents to repel and chastise the insolence of these rebels. He came up with them at Burnswark, where the action commenced, and was fought to Kirkonnel, when Douglas was taken prisoner, and the Duke of Albany made his escape. Having now recovered the booty, and obtained a complete victory, he was pursuing the broken remains of the hostile army; and, being wearied with the fatigues of the engagement and the wounds which he is said to have received in battle, he was supporting himself with his spear, resting by its handle upon the crutch of his saddle, when one Gass, from the parish of Cummertrees, who had fought under him in the engagement, coming up, thrust him through, on account of a sentence which he, as master warden of the marches, had passed upon a cousin of Gass. Upon the spot where Maxwell fell and the execrable deed was committed, this cross is said to have been erected, to perpetuate the remembrance thereof to posterity. It is a handsome pillar of a conoidical, or tapering form, nine feet in height from the socket, with a head consisting of four *fleur de lis* cut out of the solid stone.

CANADIAN IMPROVEMENTS.

In taking a general and comprehensive view of Upper Canada (says Bouchette), and glancing retrospectively to what it was fifteen years back, the accelerated march of its prosperity and improvement is remarkably striking. Within that period, the mass of the country has been surveyed, settlements formed in almost every township, and towns and villages have sprung up with extraordinary energy, in various directions. Canals of an elegance and utility, and of dimensions* unrivalled, if equalled, on this continent, have been opened through the province. The Welland and the Rideau canals remove from the frontier, the internal communication by water, from the remotest British settlements of the St Lawrence, to the sea. The Bulington and Desjardins canals afford important advantages to the fertile district in which they are situated.

The navigation of the lakes and rivers has undergone the greatest amelioration. Eight or ten steamboats, some of them of great elegance, now form several complete and convenient lines of communication between the remote parts of the country. Manufactures and mechanics have also made considerable progress; coarse linens and woollen cloths are successfully manufactured for domestic use by most good farmers; and manufactories of iron are established at Marmora and Charlotteville. Saw and grist mills (there are upwards of five hundred of them), distilleries and breweries, are to be found in all the settled parts of the province. The principal towns in most districts contain proper public buildings, such as churches, court-houses, jails, warehouses, &c.

At York, a provincial bank is established under legislative authority, with branches at Kingston and Niagara. District schools, under the general superintendence of a board, and the immediate direction of trustees, are established throughout the province; and a college, upon the principle of similar institutions in England, has been founded and recently opened in the capital of the colony. The learned professions—the members of which are in general numerous—have also their ornaments; and eight or ten presses issue weekly newspapers, for the most part very intelligently edited, and circulating widely through the province. Post towns are frequent, and afford conveniently the means of communication with celerity and safety.

In fact, Upper Canada is rising in a large geometrical ratio into agricultural and commercial importance; nor can we, in thus contemplating its rapid prosperity, forbear attributing it as well to the ability and efficiency that has almost invariably distinguished the administration of its government, as to the great natural energies and resources of the country.—*The British Dominions in North America, by Joseph Bouchette.*

* Understood as to breadth and depth. The Grand Erie canal is infinitely longer than any of these: but it is only calculated for vessels of inferior burden.

THE CUTTING DIAMOND.

The art of using the diamond for cutting glass has undergone, within a few years, a very important improvement. A glazier's apprentice, when using a diamond set in a conical ferrule, as was always the practice about twenty years since, found great difficulty in acquiring the art of using it with certainty, and at the end of a seven years' apprenticeship, many were found but indifferently skilled in its employment. This arose from the difficulty of finding the precise angle at which the diamond cuts, and or guiding it along the glass at the proper inclination when that angle is found. Almost the whole of the time consumed and of the glass destroyed in acquiring the art of cutting glass, may now be saved by the use of an improved tool. The gem is set in a small piece of squared brass with its edge nearly parallel to one side of the square. A person skilled in its use now files away one side of the brass, until, by trial, he finds that the diamond will make a clean cut, when guided by keeping this edge pressed against a ruler. The diamond and its mounting are now attached to a stick similar to a pencil, by means of a swivel allowing a small angular motion. Thus the merest tyro at once applies the cutting edge at the proper angle, by pressing the side of the brass against a ruler; and even though the part he holds in his hand should deviate a little from the required angle, it communicates no irregularity to the position of the diamond, which rarely fails to do its office when thus employed.—*Babbage on Machinery.*

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

THE LAND OF SCOTT.

THE district which this mighty genius has appropriated as his own, may be described as restricted in a great measure to the counties of Roxburgh and Selkirk, the former of which is the central part of the frontier or border of Scotland, noted of old for the warlike character of its inhabitants, and even, till a comparatively late period, for certain predatory habits, unlike any thing that obtained at the same time, at least in the southern portion of Scotland. Though born in Edinburgh, Walter Scott was descended from Roxburghshire families, and was familiar in his early years with both the scenery and the inhabitants, and the history and traditions, of that romantic land. He was, indeed, fed with the legendary lore of the Borders, as with a mother's milk; and it was this, no doubt, which gave his mind so remarkable a taste for the manners of the middle ages, to the exclusion of all sympathy for either the ideas of the ancient classics, or the literature of modern manners. There was something additionally engaging to a mind like his in the poetical associations which have so long rendered this region the very Arcadia of Scotland. The Tweed, flowing majestically from one end of it to the other; the Teviot, a scarcely less noble tributary; with all the lesser streams connected with these two—the Jed, the Gala, the Ettrick, the Yarrow, and the Quair—had, from the revival of Scottish poetry, been sung by unnumbered bards, many of whose names have perished, like flowers, from the face of the earth which they adorned. From all these associations mingled together, did the mind of this transcendant genius draw its first and its happiest inspiration.

The general character of this district of Scotland is pastoral. Here and there, along the banks of the streams, there are alluvial stripes called *haughs*, all of which are finely cultivated; and the plough, in many places, has ascended the hill to a considerable height; but the land in general is a succession of pastoral eminences, which are either green to the top, or swathed in dusky heath, unless where a patch of young and green wood seeks to soften the climate and the soil. Much of the land still belongs to the Duke of Buccleuch, and other descendants of noted Border chiefs, and it annually supplies much of what both clothes and feeds the British population. Being little intruded upon by manufactures, or any other thing calculated to introduce new ideas, its population exhibit, in general, those primitive features of character which are so invariably found to characterize a pastoral people. Even where, in such cases as Hawick and Galashiels, manufactures have established an isolated seat, the people are hardly distinguishable, in simplicity and homely virtues, from the tenants of the hills.

Starting at Kelso upon an excursion over this country, the traveller would soon reach Roxburgh, where the Teviot and the Tweed are joined—a place noted in early Scottish history for the importance of its town and castle, now alike swept away. Pursuing upwards the course of the Teviot, he would first be tempted aside into the sylvan valley of the Jed, on the banks of which stands the ancient and picturesque town of Jedburgh, and whose beauties have been rapturously described by Thomson, who spent many of his youngest and happiest years amidst its beautiful *braes*. Farther up, the Teviot is joined by the Aill, and, farther up still, by the Rule, a rivulet whose banks were once occupied almost exclusively by the warlike clans of Turnbull and Rutherford. Next is the Slitrig, and next the Borthwick; after which, the accessories of this mountain stream cease to be distinguished. Every stream has its valley; every valley has its particular class of inhabitants—its own tales, songs, and traditions; and when the traveller contrasts its noble hills, and clear trotting *burnies*, with the tame landscapes of "merry England," he is at no loss to see how the natives of a mountainous region come to distinguish their own country so much in poetical recollection, and behold it with such exclusive love. When the Englishman is absent from his home, he sees a scene not much different from what he is accustomed to, and regards his absence with very little feeling. But when a native of these secluded vales visits another district, he finds an alien peculiarity in every object: the hills are of a different height and vesture; the streams are different in size, or run in a different direction. Every thing tells him that he is not at home. And, when returning to his own glen, how every distant hill-top comes out to his sight, as a familiar and companionable object! How every less prominent feature reminds him of that place which, of all the earth, he calls *his own!* Even when he crosses what is termed the height of the country, and but sees the waters running *towards* that cherished place, his heart is distended with a sense of home and kindred, and he throws his very soul upon the stream, that it may be carried before him to the spot where he has garnered up all his most valued affections.

There is one part of Roxburghshire which does not belong to the great vale of the Tweed, and yet is as essentially as any a part of the Land of Scott. This is Liddesdale, or the vale of the Liddel, a stream which seeks the Solway, and forms part of the more westerly border. Nothing out of Spain could be more wild or lonely than this pastoral vale, which once harboured the predatory clans of Elliot and Armstrong, but is now occupied by a race of more than usually primitive sheep-farmers. It is absolutely overrun with song and legend, of which Sir Walter Scott reaped an ample harvest for his Border Minstrelsy, including the fine old ballads of Dick o' the Cow, and Jock o' the Syde.

It may be said, indeed, that, of all places in the south of Scotland, the attention of the great novelist was first fixed upon Liddesdale. In his second literary effort—the Lay of the Last Minstrel—he confined himself in a great measure to Teviotdale, in the upper part of which, about three miles above Hawick, stands Branxholm Castle, the chief scene of the poem. The old house has been much altered since the supposed era of the Lay; but it has nevertheless more of an ancient than a modern appearance, and does not much disappoint a modern beholder. For a long time, the Buccleuch family have left it to the occupancy of the individuals who act as their agents or chamberlains on this part of their extensive property; and it is at present kept in the best order, and surrounded by some fine woods of ancient and modern growth. Seated on a lofty bank, it still overlooks that stream, and is overtopped by those hills, to which, it will be recollected, "the lady" successively addressed her witching incantations. Immediately below the bank is a small collection of cottages, one of which has also a poetical history. It was the residence, upwards of a century ago, of a woman named *Jean the Ranter*, who sold ale, and had, among other children, one daughter of especial beauty. One day, while this bonny lass of Branxholm, as she was called, was spreading clothes upon the banks of the Teviot, she was seen by a young military officer named Maitland, who immediately fell so deeply in love with her, that he was induced to make her his wife. By this strange alliance, which was considered so extraordinary in those days as to be partly attributed to witchcraft on the part of her mother, the bonny lass became the progenitrix of a family of gentry in Mid-Lothian, while the grandson of one of her sisters was lately known at Hawick, under the familiar name of *Willie Craw*, as a crazed poet and mendicant. The story was put into verse by Allan Ramsay, who states, that, when first seen by her lover,

> "A petticoat, and boddice clean,
> Was sum o' a' her claithing"—

and it seems to have been the opinion of this ingenious poet, that dress was the reverse of requisite to set off her native charms.

Not only did this country supply Walter Scott with many of the ideas that enter into his poetry, but also with some of the characters, scenes, and incidents of his still more delightful novels. It is not our purpose to enter specifically into these; but we shall state what we lately ascertained respecting an individual, who appears to have been the original of a character hitherto, perhaps, the most misty and unreal of all his fictitious creations. The person we allude to was an Englishman named Peter Stranger, or Japhet Crook, who, about a hundred years ago, migrated into Eskdale, and, possessing some smattering of scientific knowledge, was enabled to impose upon the Duke of Buccleuch (the son of the Duke of Monmouth), in so far as to induce his Grace to enter into some weighty and expensive operations for the purpose of digging and smelting iron. These operations were conducted at a place not far from the old tower of Gilnockie, where formerly Johnnie Armstrong practised a profession hardly less dishonest, and where there is still a hamlet, termed, from Stranger's operations, the *Forge*.

From what we have heard of the pretensions of this impostor, we entertain no doubt that he must have supplied the idea of Dousterswivel in the Antiquary, like whom he was in due time detected, and obliged to withdraw hurriedly to his native country. The subsequent history of this person was curious. Travelling through England, he fell into acquaintance at an inn with an old gentleman, who, having much wealth, and no near, or at least no dear relations, was somewhat puzzled as to the manner in which he should make his will. Stranger professed to be in exactly the same circumstances, and, by a train of artful devices, prevailed upon the old gentleman to make a will in his favour, while he, at the same time, should return the compliment by bequeathing all his own imaginary property to his friend; so that the longest liver should enjoy the whole. The two wills were formally drawn up at York, and, in a short time, the death of the old gentleman put Peter Stranger into the possession of a large fortune. The brother of the deceased lost no time in coming forward to claim his rights, but after a long litigation it was found that the will could not be invalidated. The fraud, however, was fully proved, and Stranger was condemned to be imprisoned for life, and to have his nose and his ears cut off. It is said that the hardened wretch bore this punishment with unshrinking fortitude, coolly remarking, that "they might peel his head like a turnip—he would not care—so long as they left him his fortune." The case made a considerable noise in England, as is testified by an allusion to it in Pope's Third Moral Essay, addressed to Lord Bathurst:—

> "P. What riches give us, let us, then, inquire:
> Meat, fire, and clothes. B. What more? P. Meat, clothes, and fire.
> Is this too little? Would you more than live?
> Alas! 'tis more than Turner finds they give.
> Alas! 'tis more than (all his visions past)
> Unhappy Wharton, waking, found at last!
> What can they give? to dying Hopkins, heirs?
> To Chartres, vigour? *Japhet, nose and ears?*"

To which last clause, the poet appends the following note:—"Japhet Crook, *alias* Sir Peter Stranger, was punished with the loss of those parts, for having forged

a conveyance of an estate to himself, upon which he took up several thousand pounds. He was at the same time sued in Chancery for having fraudulently obtained a will, by which he possessed another considerable estate, in wrong of the brother of the deceased. By these means he was *worth* a great sum, which (in reward for the small loss of his ears) he enjoyed in person till his death, and quietly left to his executor."

Such was the history of the individual who appears to have given the hint for Dousterswivel. We shall only add, that whether Crook or Stranger were the real name of the adventurer, the latter was that by which he went in Eskdale, and was transmitted, accordingly, to an illegitimate daughter—Nelly Stranger—whom he left in that country, and who lived to a considerable age.

Not far from the same district, the novelist appears to have been supplied with the ground-story of the tale of Guy Mannering. A Dumfriesshire gentleman, whom we shall call Cavers of Gatehill, was married for many years to a Galloway lady, a relation to a celebrated northern peeress, without her having had any children, till at length, during a long stay which he was compelled to make in England, she had a child, who, he was but too well assured, was not his own, and whose birth the lady did not long survive. By the terms of his marriage-contract, this child, whose illegitimacy he could not now prove, was the heiress of his estate—a circumstance repugnant in the highest degree to his feelings, and which he was resolved to use every means in his power to avert. In the hope of keeping the child ignorant of its own destinies, and blinding the world at large to its fate, he placed it under the charge of a poor shepherd, dwelling in the hills of the English border, a few miles from Carlisle. Though he used every means of concealment, the child, as she grew up, was known or supposed to be his, and a young man, of the name of Rugby, in time wrote to Mr Cavers, requesting his permission to marry her. To this letter Mr Cavers paid no attention, and the marriage accordingly proceeded. Rugby set up business as the keeper of a public house in Carlisle, and had two children by his wife, a boy and a girl. Though no attention was paid to the family by Mr Cavers, his wife's relation, the celebrated peeress above mentioned, invariably called at the house in passing to or from England, and latterly took charge of the two children, the former of whom she sent out to India, while the latter, being most respectably educated and set forward in the world, was eventually married to a Welsh bishop.

In the course of a few years, Rugby fell into embarrassed circumstances, and could conceive no better plan of redeeming them than selling to Mr Cavers, for a thousand pounds, the claim which he now knew his wife to have upon the estate of Gatehill. This paction was ratified in the most formal manner; but in the course of a few years more, Rugby became utterly ruined, and both he and his wife died; about the same time Mr Cavers died; and the estate passed quietly into the possession of a distant relation.

When advanced to about thirty or forty years of age, Henry Rugby returned from India, with a small fortune and an impaired constitution. He purchased a small place of residence in Devonshire, where he intended to spend the remainder of his days, without ever once thinking of his native place, which he had left too young to have any recollection of, or suspecting the hereditary claims which he had upon an estate in the south of Scotland. Some time after, he happened, by mere chance, to pay a visit to an East Indian friend, residing in the north of England; and, being fond of shooting, was easily induced by that person to accompany him on a sporting excursion into Dumfriesshire. Fatigued one day with his amusement, he entered the cottage of an old woman, and, while he refreshed himself with a drink of new milk, asked many questions, such as are apt to occur to a stranger, respecting the places in the neighbourhood. He in particular asked the name and proprietor of a handsome seat on the face of a hill at no great distance, to which the old woman replied, that that was Gatehill, and that it belonged to Henry Rugby, although another person was in possession of it. Struck by this information, he made further inquiries at Carlisle, and soon became acquainted with an attorney, who undertook to prosecute his claim before the Court of Session, where, after a tedious litigation, it was affirmed. The intelligence of his success was sent him by an express, and he immediately called together a few friends, to celebrate it by a feast; but, alas for the triumphs of mortals! being tempted to drink rather more than the delicate state of his health in general permitted, he was found dead next morning. The eventual fate of the case before the House of Lords, to which it was appealed, we have not ascertained; but we think there can be little doubt, that, though different in many respects from the tale of Guy Mannering, there was enough of it to have suggested to the imagination of Sir Walter Scott the leading points of that admirable fiction.

(This subject will be concluded in a subsequent article.)

THE BENT OF GENIUS.

It is a very ancient maxim not only that poets are born with a particular constitution of mind, which it is not possible to acquire by any future training, but that there are in all men innate capacities, by the dictates of which, each is directed in the choice of the study or calling to which he addicts himself. By this diversity of talent it is that a proper poise is preserved in the framework of society, and none of its parts allowed to become too strong or too weak for the rest. The stream of mind, diverging into innumerable channels, is thus conducted equally over the whole expanse of human interests, and imparts vigour to all alike, instead of being attracted into a few large currents, each tearing up a deep bed for itself, and manifesting strength indeed, but communicating no beneficial influence to its adjacent borders. Let us take a familiar example to illustrate what is meant. Of what inestimable advantage is it to a country town that the members of its community are all impelled, each in the exercise of his particular qualifications, to follow different professions, whereby one becomes a grocer, another a draper, a third a tailor, a fourth a butcher, and so on, and a variety of conveniences are made of easy access to the whole township! Let us suppose that all the youths of the place applied themselves to the study of medicine, and, as is usual in such situations, conjoined with the practice of physicians the business of apothecaries. The windows in the main street would no doubt soon exhibit a brilliant show; with the sun glittering upon the numberless bottles of many-coloured waters, or when the vivid rainbow hues were displayed by lamp-light, and contrasted with the surrounding darkness, the effect of the gorgeous scene would be overpowering; no city ever offered any thing half so magnificent. But the condition of the people would, nevertheless, be most deplorable. Not an article to be had but "the best patent medicines!" no resource for him that objected to pills, but to take potions; and for him that had a horror of potions, no alternative but pills! Such a consummation is happily prevented, by the endless variety and degrees of intellectual capacity by which some are prompted to high undertakings, while others content themselves with humbler but equally indispensable occupations.

In the allotment of different capacities to the individuals of the human family, there is nothing more startling than in the appointment of different conditions; yet some philosophers have thought it necessary to maintain, that, in point of intellectual endowments, all men come into the world on a level of equality—that the bent of their minds is wholly determined by circumstances—and that every qualification is the result of culture. This doctrine is by them considered to be much more cheering to all who are fired with a noble emulation of excellence; for if we are to sit down in the belief, that, in as far as we ourselves are concerned, our characters are immutable, and that a limit is set to our attainments which it is impossible to surmount, then are we indeed the creatures of accident, condemned to intellectual bondage, and undeserving of any credit for the most honourable or useful actions. In this general view of the case there is something extremely fallacious—for though born to unequal means, no one is precluded from exertion, but, on the contrary, incited to greater efforts, lest those whose natural talents are less, should, by superior diligence, outstrip the more highly favoured—yet, a farther statement of the arguments by which these views are supported, will introduce us to subjects of curious and most interesting inquiry.

It is noticed, from the earliest years of some boys, that their apprehensions are duller than those of their companions; let instructors do what they please, they can never, by the gentlest persuasions or the harshest stripes, quicken their doltish wits to keep pace with apter scholars. But this difference of capacity, undeniable as it is, and observable in all the stages of life, is by no means decisive of the question: it brings us to an early period of human existence, and shows us what the boys are, after being modified by the previous education to which each has been subjected; but it does not exhibit the soul in its naked and native energy, before its efforts were either curbed in one direction or encouraged in another. In the first two years of their lives, children learn a great deal more of what is practically useful, than they do in the same time at any future period of their lives—they learn the use of their senses and their limbs; at first they have no notion of grasping or holding fast; they have no notion of what will hurt them, or of what is harmless, and will seize the edge of a razor as readily as a bunch of feathers; they have no knowledge of the comparative gravity of objects, and sometimes make long and ineffectual attempts to move from its place a weight which it takes the strength of a full-grown person to raise: it would be endless to enumerate all the acquisitions they have to make; and in the course of these, no two children are placed exactly in the same circumstances, or have their faculties exercised precisely in the same manner. If it were possible that they could be so situated and so trained, then we should probably observe similar results in an uniformity of dispositions and of abilities; had they been equally encouraged to pursue one thing and avoid another, their inclinations would have run with the same force in the same channel. But this is not the case; and their characters come to be as various as the seemingly unimportant, but, in reality, most influential events in their little lives. No one can tell how many empires have stood fast, because, in numerous instances, the desire of dominion was checked in infant minds, by fruitless attempts to remove a heavy piece of furniture, or to push back the walls of the chamber, in order to obtain larger scope for their nursery gambols. The mystery which involved the sources of the Nile, and the termination of the Niger, was perhaps prolonged for ages, in consequence of the spirit of adventure being extinguished in more than one child, who, on first venturing a-field, got into sloughs, and escaped, after great consternation and floods of tears, shoeless. The powerful effect produced by such trivial occurrences on the youthful and flexible powers of thought, has never been duly considered, and can never perhaps be properly estimated.

But to go a step higher still—we see that there is a frequent conformity between the mind, and the body which it inhabits. We no more expect to find the fiery energy of the Arab scintillating from the calm eyes of a Dutchman, than that pepper should be produced from reeds in the fens of Holland or of Lincolnshire; and even among men of the same nation we uniformly perceive the varieties of mental character conjoined with corresponding peculiarities of frame. Clumsy limbs and a heavy lumbering figure are not accompanied by vivacity of wit and a penetrating judgment; but small men, "good of their inches," are instinct with activity of mind, as if their souls, condensed in a small compass, were fitted, like a garrison whose posts are not too far apart, to be on the alert at every point. Nay, in the very same person, whatever tends to invigorate the body enlivens the mind in an equal degree. In support of these opinions, many striking facts are adduced; but into these we shall not at present enter.

Whatever truth there may be in these speculations—and they are undoubtedly of great weight as far as they go—the soundness of the popular opinion is not shaken by them. They prove only that ideas are not innate, but are communicated, according to circumstances, from the external world; while they leave uncontroverted the fact, that the capacity or aptitude for entertaining particular classes of ideas is implanted in the mind from the earliest period of its connection with the body. That a sluggish soul for the most part finds a congenial habitation in an inactive body, is apparent enough to the most limited observation. It is also true that a mind so situated is subjected to a disadvantage in depending for its impressions upon an inefficient set of intelligencers, which is the case when the bodily senses are obtuse. But are not the abilities of the workman displayed by the very instruments to the use of which he accustoms himself? If a labourer resorts to ponderous implements, and manifests a predilection for felling trees, we do not usually predicate of him, that, with the same industry and with minuter tools, he would have been as expert in the more ingenious art of engraving upon wood. His occupation is evidently determined by his aptitude for slow, although powerful, exertions of muscular energy, which is something very different from that nicety of touch and manual dexterity which are necessary to turn the lines that are to express the features, or to scoop those hollows that are to give to a miniature landscape its contrasts of light and shade, and to hit off, with precision and ease, the difficult transitions from the one to the other. There is no more reason for supposing an original uniformity in all men's minds, than for alleging that the stamina of the bodily frame and the groundwork of the features at first presented no variety, but were modified and moulded wholly by the foods and drinks which nourished them, and by the pressure of the atmosphere amid which they were developed.

Precocity of genius in particular directions is so frequently manifested, that it is not possible to conceive that it depends in any measure upon circumstances or education. When a lady, who has since made a conspicuous figure in the world, was an infant, her father's residence happening to be within hearing of one of the city clocks, she withdrew her lips from the breast to listen to the hours when they were struck; from which, even at that early period, it was with truth conjectured that the vibration of sound affected, in her, organs peculiarly sensible to musical impressions. How many at the same age were then, and have since been, within range of the same peals, who yet continued to drain their nurses with a total indifference to their loudest reports! And yet, if it were true that children are nothing but what early circumstances

make them, a love of melody should distinguish all those, who, having been born within a certain distance of a church bell, have had the capabilities of their ears aroused by such repeated and sonorous appeals to them. The same girl justified the expectation of her parents by playing to admiration on the piano-forte at five years of age, and, being patronized by the Duchess of Buccleuch, composed music, and published it, and dedicated it to her patroness when she was eight.

It is true that a deficient ear may be to a certain extent rectified, and rendered more susceptible of harmonious modulations of sound. Dr Vandermonde's experiments to correct what is called a false voice proved this very satisfactorily. He conceived that defects in the utterance arose for the most part from some inequality of strength in the organs of hearing, or from some want of delicacy or tension, so that discordant sounds are communicated to the sensorium, in endeavouring to imitate which, our own tones are pitched in an unpleasant key. In accordance with this theory, he took a child whose voice was unmusical into a spacious apartment, and, having stopped one of her ears, made her recede till she no longer heard the sound of a repeating-watch which he held in his hand. Desiring her to remain in the place where this happened, he advanced, removed the cotton to the other ear, and then, resuming his former position, caused the watch again to strike. The child was surprised to find that she again heard tolerably well. Having thus ascertained which ear was the weak one, the other was kept as close as possible, in order to exercise that which wanted strength. The child was requested to sing from time to time, and the other necessary experiments were made to discover whether both ears had been brought to have the same sensibility. In this manner a true voice was obtained in the same proportion that the perception of sound was harmonized. These experiments are exceedingly curious, as proving that an ear for music may be wonderfully improved when it is imperfect, if people will take the necessary trouble while the organs are tender, and susceptible of modification. But we do not learn that any one was ever made a musical prodigy by the use of these means; and we have abundant instances, besides the one already alluded to, of children who have been so, almost without any sort of cultivation. The force of natural genius might be shown to be equally powerful in all other departments of human knowledge; so that the effect produced upon mind, by matter, or, in other words, by external circumstances of every kind, though great, must be pronounced to be only subsidiary; the popular opinion, in this instance, as in many others, being found to maintain its ground against all the ingenuity of speculatists.

A TALE OF TWEEDDALE.

Amidst the hills of that district of Scotland called Tweeddale, there are many lonely vallies, which seem remote from all human ken—little separate regions, where you may loiter for a summer's day without seeing a living thing, save a few straggling sheep, who lift up their heads in seeming wonder as you pass. Or there may rise from your foot a startled hare, or a covey of moorfowl, unused to such intrusion; where no sound reaches your ear excepting the song of the sky-lark, the bleat of the sheep, the hum of the wild bee, and the low murmuring of a burn, stealing along its quiet way to pay its tribute to the Tweed. It was to one of those sequestered spots, being a stranger in the country, that I was one day led by an old man, who undertook to be my guide to the best streams for trout-fishing. But though now deserted by man, as I have described this valley, there had been a time when it was inhabited, as appeared from a roofless and ruined hut, over the walls of which the ivy and the wild-flower had apparently crept for years. I observed to my guide what a lonely dwelling it must have been. "It was so," said the old man; "but love and youth can make any place a paradise; and happiness once dwelt there, though it did not continue; and though the fate of its hapless inhabitants made a great noise in the country at the time, it is now in a measure forgotten, for it is more than fifteen years since a fire was kindled in that lone house." Perceiving by this that something remarkable had happened to the last occupiers of the desolated hut, and being tired with ascending and descending the neighbouring hills, I sat down, and requested the old man, who was the schoolmaster of a village where I had for some days taken up my abode, to gratify my curiosity by repeating to me the story to which he had alluded. The place where I had chosen my seat was a little grassy bank, near the brink of the rivulet, and about forty yards below the site of the little ruin, which stood on the side of a hill; and the old man, having placed himself beside me, began his narration.

"My occupation as a teacher gives me, of course, an opportunity of observing with accuracy the dispositions of the youth I instruct; and I have never met with a girl of more ardent affections, or of better temper, or who possessed more amiable qualities, than Helen Symington. She was the daughter of an honest and respectable weaver in our village, of which, as she grew up to womanhood, she was the pride. When scarce twenty years old, she married William Brydon, a sensible, well-disposed young man, who was principal shepherd to the owner of this property, and came here with him to live in that cottage which is now a ruin, but which was then, by the unwearied industry of Helen, a neat and comfortable habitation; and never, in those early days of her marriage, did lark carol more blithely to the sun, than did she while employed in her household occupations, or, as, passing over the heather with a light step, she carried some refreshment to her William, when detained with his flock in some more distant sheep-walk. Even when left by herself in this wild solitude, she felt no loneliness, for all was peace and joy within and without. William loved her entirely, and her alone; and she knew it, and in that knowledge all her earthly wishes were complete. Yet was this feeling of felicity still increased, when, before the year had completed its circle, she sat, in a summer evening, on yonder little turf seat at the door, with her infant in her arms, watching her husband descending the opposite hill, and drawing nearer and nearer, till at length her baby shared with her in his caresses. The second winter of their abode here was unusually severe, but it was William's care to guard his wife and his child from its inclemency, by many little ingenious contrivances to render their cottage more impervious to the cold; while Helen looked forward each day with longing solicitude to the evening hour which restored him to a participation of its comforts, and seated him by its cheerful hearth. And thus the winter had nearly passed away, and they began to anticipate the varied joys of spring, when the birds would again sing around their cot, and all nature, awakened from its wintry sleep, would start anew into life and joy. The month of February arrived, and the weather seemed so settled and serene, that, for two successive Sabbaths, Helen, with her infant enveloped in her cloak, and accompanied by her husband, had crossed the hills to the parish church. On the second of those Sabbaths, they "took sweet counsel," and, walking together to the house of God, they conversed of a better and a purer world, where they should fear no after parting. And as Helen listened to her husband, who was eloquent on this subject, she thought she had never heard him speak so like a minister, or seen him so full of holy hope. I notice this particularly, as it was a circumstance I shall have occasion to mention again. On the next morning after this conversation, William departed with the sheep from this valley for a distant fair. The weather was still fine when he gathered his flock, and bade farewell to his beloved Helen for three days, promising to return on the evening of the third. He had never been absent from his home all night but twice since his marriage, and that for a single night each time. His wife, however, expressed no fear from being left alone for so unwonted a time; for the fact is, that there is in general more courage in women of her humble rank in life, than in any other, for they are too much occupied to find time for the indulgence of idle alarms; nor do they meet with any encouragement to affect fears till the folly becomes a habit. Neither did William experience any uneasiness on account of the solitariness of the dwelling in which he was to leave her, considering that very circumstance as the principal warrant for her safety.

"The weather, I have said, was fine at the time of his departure, but in our treacherous climate, and especially in these hilly districts, there is nothing more uncertain than a continuance of settled weather at that season of the year; and never did it exhibit more rapid transitions than during the three days of William's absence. Before the shades of the first night had fallen on the hills, the rain had descended their sides in torrents, and swelled the little burn into a river. On the second night, the clouds had disappeared, and a keen frost succeeded, which, ere morning, arrested the water in its course, and transformed the ground for some distance round where we now sit into a frozen lake. Again, another change came o'er the spirit of the storm: dark clouds began to muster, and showers of sleet and snow to fall, till all again was hoary winter. But still, when night came on, there was seemingly, from the quietness of its descent, no depth of snow, though it had fallen at intervals for many hours, and, as the time was now arrived when Helen expected to see her husband, she felt no dread of harm; and no sooner had she put her baby to sleep, than she prepared a change of garments, a warm supper, 'a blazing ingle and a clean hearth-stane,' for her William, and often opened the door to listen and to look out, if haply she might discern his dark figure against the opposite white hill, descending the foot-path toward his home. She was, however, as often disappointed, and returned again to heap fresh fuel on the fire, till she began to feel, first, the heart-sickness of 'hope deferred,' and then the heavy pressure of foreboding evil; and when her baby waked, there were in the melancholy tones of the hymn with which she soothed him to his rest, a soul-subduing pathos; for it has been my lot to hear again that lullaby when it sounded even more deeply affecting than it could then have done. Poor Helen continued all night her visits to the door, till at length, just as morning began to dawn, she heard her name shouted out by the well-known voice of William. Joy came to her heart, for she thought he had seen her, and, though she looked in vain for him, still he was near. But again she heard his voice, and his words fell distinctly on her ear, 'Oh Helen, Helen, I perish.' She flew with the speed of lightning down the bank; but when she approached near to this spot, her progress was arrested, for the ice, from which the water had receded below, would not bear her weight. And then it was for the first time she discovered, through the indistinct glimmering of the dawn, and by his own words, that, on William's having reached the middle of the burn, where the force of the stream below had rendered it hollow, the ice gave way, and he was only kept from sinking by his arms resting on the surrounding part, which was still firm. Again and again did Ellen try in each direction to reach him, in spite of his urgent entreaties to keep off, and his assurances that he had hopes of being able to maintain his position for a length of time, from the manner in which he was wedged between the ice, and its apparent thickness in that place where it had been gurged together, though he feared to make the smallest exertion to extricate himself, lest he should go down. In this extremity there was only one course which gave the agonized Helen any chance of saving the life of her husband, and that was, to seek for aid more efficient than her own. Meantime, William was almost fainting with exhaustion from fatigue, cold, and hunger; and Helen, thinking that if she could supply him with some food, he would be better able to endure his situation till she could procure assistance, she ran to the house, and, putting some of what had been intended for his supper into a small basket, she took a sheep crook, and, having tied a stick to one end of it, she hooked the basket on to the other end, and in this manner conveyed it to him. At the same time she pushed a blanket close to him with the crook, and, having seen him draw it by degrees round his head and shoulders, she returned to the cottage, wrapt her child in a small blanket, and, throwing her cloak around her, took it in her arms; then, having taken a hasty leave of her husband, in words which were half a farewell and half a solemn prayer for his preservation till her return, she set off on her journey of four miles to the next farm-house, for no nearer was there a human dwelling.

"Helen Symington was at all times active, but now a supernatural strength seemed to be given her; and, in spite of her burden, she proceeded swiftly through the snow, surmounting the hills with incredible rapidity, and flying rather than running down their declivities. Thus she proceeded till nearly three of the miles were passed; but the snow, which had ceased falling for some time, now again began to descend thickly, and was accompanied by sudden gusts of wind, which drove it full in her face, and prevented her seeing the different objects by which she marked her way. She wandered on in this manner, endeavouring to avoid the deeper parts of the snow, which the wind was beginning to drift into hillocks on all sides of her; while she was almost driven frantic by the fear of losing her way, and by the cries of her infant. In vain did she endeavour to warm him, by pressing his little limbs close to her bosom, and by doubling and redoubling the cloak over him, regardless of her own exposure to the biting blast. He at length gave over crying, and, fearful that the torpor of death had seized him, and feeling her own strength beginning to fail, despair seemed to seize her, when the snow ceased for a short time, and she found that she had wandered far away from the road to the onstead which she so eagerly sought to reach. But thoughts of her husband again strung her nerves, and she once more regained the right direction. This happened several times; and had she been alone concerned, she must have perished; for nothing but the energy inspired by the faint hope of saving her husband and child, prevented her from lying down to die. But what a gleam of joy shot through her overspent frame, when, on looking up, just as a fierce blast had swept by, she beheld the

farm-house at a short distance! New strength seemed now again imparted to her stiffening limbs; and she reached the door, told her tale, and almost immediately four men, belonging to the farm, were ready to start, with all necessary implements, for extricating William from his singular and perilous situation. Helen's infant, which had been benumbed for many hours, showed little signs of recovery: she however delivered it, though with an aching heart, to the farmer's wife (a benevolent woman, who was herself a mother), and determined, in spite of all advice and opposition, to return to her husband. Nor, had she remained, could she have served the poor infant, who died shortly after she left the house.

"The poor distracted wife, mounted on horseback behind a man, now proceeded on her way with all the speed the animal could exert in its toilsome journey, while her whole soul was absorbed in the one desire of finding her husband alive, of which no hope could have been entertained, but for the depth of the valley, which, from the way that the wind set, might, in a great measure, have occasioned it to escape the drift that was fast blocking up the roads, and transforming plains into hills. But who shall calculate the years of misery which Helen seemed to endure, while this suspense hung over her? She was, as I have said, possessed of deep and ardent feelings, and they were now strained to their utmost tension. After much difficulty in avoiding the deeper wreaths of snow, and in floundering through the less dangerous, the party at length reached the entrance of the valley. All here seemed propitious to their hopes, for the snow was but little drifted. The men who were on foot had, however, by a nearer way, which the horse could not travel, first reached the spot where, sad to tell, though poor William still retained his suspended posture, the snow was drifted over him, and he no longer breathed. They had, however, succeeded in extricating the body, which they bore to the cot, and laid upon a bed before the arrival of Helen, who, with a frantic hope still clinging to her heart, repeated, unweariedly and often, every means to bring him back to life, though foiled in all. Alas, poor girl! her young and ardent heart had loved her husband almost to idolatry, and with him the charm of life was fled. The spring of hope and existence was dried up at the fountain head. The stroke was too heavy for her to bear, and a brain fever was the immediate consequence of her great bodily exertion and mental suffering. For a considerable time her life was despaired of; yet youth, and the natural strength of her constitution, gained a transitory triumph, and some degree of bodily health returned, but the mind had become an utter ruin. She was removed, as soon as it could be safely accomplished, back to our village, and became again an inmate of her father's house, where I have often sat for hours listening to the suggestions of her wayward fancy, where William still reigned paramount. Fortunately, all that had passed since the intensity of her suffering began, seemed quite annihilated in her recollection, for she talked of her husband as still absent at the fair, and still sung to her infant that hymn with which she soothed it to sleep on the first night of her misfortunes, and which has often forced the tears from my eyes, and the sobs from my breast. No tongue can describe the touching melody of her soft and melancholy voice, or the sweet subdued expression of her beautiful countenance, which became daily more wan and delicate, till, at the end of two years, her weakness was so great, that she was unable to rise from her chair, and I was one evening sent for in haste to see her. When I entered her father's house, I was met by the old man, who imparted to me the surprising intelligence that Helen had recovered her senses. I immediately anticipated that a change was about to take place, and had no sooner looked upon her than I was confirmed in my opinion. Sorrow had completed its work, and she was about to pass from our sight for ever. The recollection of her husband's sad fate had returned with her reason. But neither the remembrance of it, of her own sufferings, nor the knowledge of her child's death, which she now knew for the first time, seemed to trouble her, for her thoughts were fixed on that better country where she rejoiced that they were already waiting her arrival, and spoke of the conversation which passed between William and her on the last Sabbath they were together, as an earnest which it had pleased God to vouchsafe of their happy meeting. I am an elder of the church, and it was in that capacity that Helen sent for me to pray with her, which I did with a fervour I have seldom felt. But never has it been my lot to witness an appearance so heavenly as she exhibited when I rose from my knees. She sat in her chair supported by pillows, with her hands clasped, and her dark soft eyes beaming with an expression so holy, that she seemed like some disembodied spirit, which, having been perfected by suffering, had returned to encourage and to comfort those who were still in the vale of tears. When I bade her farewell, and promised to see her next day, it was with a presentiment that I looked upon her for the last time. And so it proved; for I was next morning informed that her spirit had taken its flight about twelve o'clock the night before."

The old man thus concluded his melancholy tale; and, after sitting for some time in silent reflection, my guide again spoke, and, pointing to a deep pool at some distance down the stream, informed me that large trout were sometimes caught there; and having adjusted our fishing tackle, we proceeded to it. But though our sport was unusually good, it did not banish from my mind, during that day, for a single instant, the affecting story of the ill-fated Helen Symington.

REMINISCENCES OF MY TRAVELS.

When a traveller commences to write a history of his journey into the regions he has visited, he usually takes the trouble of informing his readers of the cause of his peregrinations. Following up this excellent practice, I have to premise, that, from my earliest years, I was reckoned a most adventurous boy. When only four years of age, I undertook a journey from our dwelling, in the neighbourhood of Leadenhall Street, to the distant western territory of Hyde Park; and the wonderful sights which there met my eyes having given me an extraordinary thirst after foreign climes, I perused every book of travels I could secure, devouring, in particular, those on Egypt, Abyssinia, and similar countries; and, being afterwards placed in easy circumstances, I determined to devote myself to the investigation of every thing remarkable, whether at home or abroad, and then communicate to the world the discoveries I had made. These delightful anticipations I am now about to fulfil.

From previous information, I had gleaned that he who travels should consider his health of vital consequence; since sickness impedes, and death usually terminates, a journey. Therefore, not intending to have a physician in my suite, nor a medicine-chest in my luggage, I procured a stout umbrella—one that would keep good in any climate, whether to keep off the rain or the powerful rays of the sun, and, by its bludgeon-like appearance when closed, keep respectful those persons who might otherwise become too familiar. Thus, having less to fear than many travellers, I speedily got beyond the bounds of the metropolis, and, after getting so far, endeavoured to ascertain which way the wind blew, by suspending a hair over the face of my pocket-compass. My thermometer stood at 63½. During these scientific inquiries I was accosted by a young man, who wished to know what it was o'clock. This I could not answer; but I added to his stock of information by proving that a pocket-compass was not a time-keeper. This led to friendly intercourse; and together we travelled over the dreary waste of Hampton common. I learned his name was Timothy; that he had left home because he chose; that he had taken leave of no one; first, because he did not like; and, secondly, if he had, his excursion would have been prevented. He seemed like a bird escaped from a cage, and certainly possessed a love of travelling. In the latter particular there was reciprocity of feeling, and we were, consequently, drawn towards each other. But, however chat may make shorter a road, walking after being fatigued is not very conducive to pleasure; we therefore surveyed the immense space before us with dismay. It was on the 1st of June—the year is of no consequence—we were on the confines of Twickenham common, which is bounded on the north-east by the desert of Hounslow, and on the west by the common of Teddington. We ardently hoped that some caravan might pass on our way, not that we were alarmed, but that it would be more pleasant to feel in security while passing any dangerous portion of this expansive country.

I looked round—no human being near me save Tim—behind me stood some of the giant oaks of Bushy Park, and full in the front rose the furzes and the tall poplars of Twickenham. I could not, however, resist taking a sketch of an ancient landmark near the modern road. Tim looked over my shoulder as I placed it in my book, saying, "You might have written God knows how many pages, and I should not have understood it half so well." "You are fond of the arts, Tim," said I. "Not altogether that," replied he; "but because I find reading more difficult." "Ah! I am sorry for that, Tim," said I; "because your usefulness and your pleasures will be considerably abridged." "I am sorry for it," replied Tim. "Pray, Tim," inquired I, "to what does the pronoun *it* refer?" "The usefulness," answered Tim. "That does you credit," said I; "you must seek every opportunity to improve yourself. You may travel with me, rendering all the assistance you can; and I will reward you as I may be enabled." Tim nodded assent. "My pursuits are literary and philosophical." "That's famous!" cried Tim. "Fame may follow," sighed I, "when bread is not required. We do not possess the longevity of a parrot, nor the accommodating appetite of a chameleon. Few and full of sorrow are the days." "Oh!" exclaimed Tim, "many and full of fun would suit me better, Sir." "Be cautious, Tim," said I, "never to lessen the importance of the traveller by becoming a jack-pudding, particularly in those regions through which I intend to pass."

It never occurred to me till now that I had neither spelling-book, grammar, nor dictionary, although it is well known that travellers have so much need of them; consequently, I felt under circumstances rather unpleasant, for I could not be assisted by Tim, even in orthography, nor blame him for being a heedless amanuensis. Well, thought I, as usual, some one must correct my journal, by touching in, and scratching out, by and by. I pursued my journey across the heathy wilds, in the direction of Twickenham, occasionally surveying those immense ranges of country towards Hanworth, and the vast gravelly regions towards Teddington, but found nothing scientifically interesting. There are not any stupendous granite rocks, such as are seen in Upper Egypt—not a sphynx, nor a pyramid, nor a temple with a mummy in its chambers, nor the remains of a sarcophagus, nor an Ibis, nor a serpent with his tail in his mouth. I travelled with my pencil in my hand: both Tim and myself kept our eyes open, excepting those intervals occupied by winking; yet neither of us saw any of those alluvial plains observable in Moldavia—not a fountain, such as are seen in Italy—no remains of architectural grandeur, sculpture, nor inscription—not one jet d'eau, like those common in Bulgaria—no arches nor obelisks, decorated with lines from the Koran, as in Turkey. In fact, there is not the least portion of ancient grandeur in a state of dilapidation, to excite a traveller's enthusiasm, on the extensive route alluded to, or the vast expanse lying before us, or between Hampton and Twickenham.

In different districts of the country, the banks rose rather precipitously to the amazing height of four, sometimes ten feet, formed of gravel, or agrigillaceous earths, in various strata. On the summits of these banks, and in the vallies between, I observed a species of vegetation, which grew in filaments of unequal lengths, and generally of a greenish hue, in all probability the *Festuca ovina* of Linnæus. On this, some huge horned quadrupeds of the Bos species were feeding. On examining more minutely, I found large portions of the soil to be entirely covered with this singular vegetation.

It does not appear that the rhinoceros is to be found in any of the ranges of this country, nor that the crocodile nor alligator inhabit the lakes or pools, of which there are many. During the period I traversed this course, I had not seen one camel nor dromedary; therefore I concluded that the merchants of the bordering countries choose other means of conveying their wares.

On one occasion I saw an immense cloud, of a light sandy colour, rise in the eastern horizon. It could not be a simoom, from its hue; it might have been a sirocco, but the breeze, which was becoming intolerably sultry, fortunately shifted to the north-west, and I escaped. To gratify Tim, I ascertained the latitude and the longitude; yet, how distant our position was from Bassora or Bagdad, I neglected to determine. In vain did I hope some caravan would pass on our line of march; for I had some apprehension from the tribes of wandering natives that might infest the country, and I was compelled to proceed with the utmost care, now moving slowly, then hastily, as circumspection dictated, until, greatly fatigued, I hailed the walls of Twickenham. Tim and I turned towards each other, and piously ejaculated, "thank Heaven."

As I approached the town, I observed what I conceived to be an incontestible evidence of the dawning of genius amongst the natives: it was a figure in which anatomy and character were united, drawn with chalk, on the outworks. The head was formed by a circle, from the lower extremity of which a zig-zag line descended, indicating the vertebræ of the neck and back; a cross line was made a little below the head, for the clavicles; from which, on either side, were drawn lines, evidently the upper and lower arms, at the extremities of which the digiti expanded. A second cross line, at the base of the spinal column, represented the pelvis; from either extreme issued the lower limbs, in tolerable proportion. The whole figure had an air inclining to the heroic, but the lines which described the features were irresistibly comic. The mouth was curved upwards with a grin of confidence; the nose was rather long, encroaching on the upper lip; the eyes were large, removed too far from the nose, and the pupils were so situated as to give an idea of great affection, from their inclination towards each other. I could not learn if this were a delineation of the patron saint, or the guardian angel of the place; it was, notwithstanding, highly gratifying.

I passed on without interruption into the heart of the town. No fortification, moat, or drawbridge; no officers of municipality, no gens-d'arme, no Cossacks, Bostangi, nor constables, to offer impediment while I examined several useful and ornamental objects, and I began to consider that I must have entered a country where science and philosophy were extensively cultivated.

In or near the centre of the town, a machine had been constructed expressly to exhibit the changes of the wind. On the summit of a tall painted staff is a perpendicular rod of iron, on which is made to act a horizontal piece of metal, capable of being moved by the slightest breath of air, and in the form of an arrow; therefore denominated a *weather-cock*. Well, the wind acting on the broad or feathered end of this arrow, its point turns to the quarter whence comes the breeze. The cardinal points are pointed out by the characters E. N. W. S., placed just below the revolving arrow; thus, it is clear that those who know the signification of those characters, and their application to the machine, can guess which way the wind blows. I have ventured to think, if names have reference to uses, this machine might be called a wind-arrow, seeing it has nothing to do with either a cock or the weather.

I also observed a marker of time, placed in an elevated situation to exhibit the hours as they pass. This machine, within, is complicated; externally it has

a circle, on the outer portion of which Roman numerals, from one to twelve, are placed; three and nine being horizontal, six and twelve perpendicular, to each other. On the centre a sort of spear revolves, pointing to the hour with great regularity; but to distinguish any hour of the day, the sun is very essential, for during the visit of the sun to our antipodes, the hour is said to be of the night. Well, this machine is presumed by the natives to be acted upon by intellectual determination, which its face is to signify, the features being the index of the mind. I confess I could discover neither of these, notwithstanding many individuals very sagely declared the time was not truly told, by which I learn the machine is not infallible. It, however, pays great attention to public information, for those who cannot see, may hear the hour announced by its hammering on a bell the number of blows required. At the time of my patiently investigating the usefulness of this machine, I saw it was near twelve A.M., and therefore prepared both eyes and ears for the enjoyment, because I was informed "the chimes would play." All occurred as foretold, correctly as the calculation of an eclipse.

These "chimes" or chimings are mechanical performances of certain pieces of music by numerous hammerings upon suspended bells, the effect of which is not so sonorous as gongs, nor so shrill as cymbals, but resembling the jangle of stones rattled in tin-kettles. which, in great variety of tones, produce cadences very surprising. Those bells are not suspended solely to hammer melodies upon; for to each of these ponderous musical instruments a large wheel is attached, from which a stout rope is pendant, and, on particular occasions, a number of the natives assemble to pull those ropes, by which the wheels are moved, and with them the bells. Now, in the hollow of each bell, a knob of iron, called a clapper, is suspended, which, as the bell is moved, falls with considerable force against the side; and the result of these pullings and clapperings is a succession of astounding clangs, which, being multiplied and aggravated into distracting uproar, is called by the natives a "*merry peal*," "*changes*," and "*triple bob-majors*." It was not until I had almost been stunned by these bob-majorings that I began to doubt if the natives possessed a musical taste; yet I proceeded to examine an inclosed area, in which the tower or depositary of these bells stood, and found it to be a burial-ground. I copied several inscriptions; others, on which the scythe of Time having cut deeper than the characters, perhaps may be deciphered by those who depend more on imagination than demonstration. I saw many hieroglyphics and sarcophagi, but not a mummy was visible, nor one that I could purchase. I was therefore deprived of the pleasure of removing a body from its interment.

I had been so fully occupied in my researches as to have forgotten Tim, and he had been so wanting of employment as to have forgotten himself in a sound sleep; but as he appeared much refreshed, I was led to think rest as conducive to health as antiquarian pursuits.

The colossus of British literature said, a vessel was a prison, with a chance of being burned or drowned. Tim agreed in the correctness of the Doctor's remark, and nothing but a love of enterprise could have urged me to quit the solid earth. Timidity should never form any part in the composition of a traveller. Although discretion is said to be the better part of valour, caution and fear are so nearly allied, that I regret never having obtained a perfect method of discovering how the distinction may be ascertained. Of one particular I was certain, viz. that heedlessness of personal danger is one of the greatest charms narration can possess: this determined me to embark. I agreed with a captain whose vessel was ready. My luggage, Tim, and myself, were quickly on board. The sails expanded to the gentle breeze, and we quitted port in gallant trim. The history of my voyage of discovery must, however, be left till another opportunity.

BIOGRAPHIC SKETCHES.

HENRY CLAY.

"Were one of the richest men in the world to arrive in New York, no matter how splendid his retinue or equipage, it would excite no attention, and but little remark; whereas, let a person of eminent intellectual character appear—any great orator, for instance such as Mr Clay—the whole population would be roused into a state of excitement."—*Stuart's America.*

In giving some facts in the life of this distinguished individual, we have but one object in view; and that is, to show what can be accomplished by native resources of mind, unaided by the fostering care of guides and teachers. Mr Clay has undoubtedly strong original powers, an intuitive genius, rapid perceptions, and a vigorous imagination. He has also been placed in circumstances which compelled him to act. Still he is a self-taught man. To collegiate discipline, and academic guidance, he is not in the least indebted for his extraordinary attainments. Far beyond many, also, who have educated themselves, he has the graces and delicacies which are generally acquired only in the halls consecrated to study. He has not only the enthusiasm and wildness of a Kentuckian, but the beauty and gracefulness of classic lands. He has the strong, native sense of a backwoodsman, combined with the amenity and polish which are required in the ancient seats of learning. We regard this as a striking and most valuable fact. Mr Clay will exert, doubtless, considerable influence in future time, and after his death, as a model of oratory. The events of his life, the circumstances in which he has been placed, as well as the native qualities of his mind, naturally point him out as an attractive example for the youthful heart to dwell upon. The generosity, the frankness, the enthusiasm of his character, will win their way, where simple, solid, sterling excellence would find no place. Mr Clay has been the warm and eloquent advocate of the independence of the new Southern Republics, and of emancipated Greece. With two or three exceptions, he has manifested himself to be superior to local views and temporary interests, and to be actuated by high regard for the welfare of the whole country, and of future times.

HENRY CLAY was born in Hanover County, in the state of Virginia, on the 12th of April 1777. His father, a clergyman of considerable talent and high respectability, died while Henry was yet a child. At an early age, the lad, having a common school education, was placed in the office of Mr Tinsley, clerk of the high court of chancery, at Richmond, Virginia. In this situation he met occasionally with the distinguished men of the state; and at length, by his amiable deportment, and his striking displays of intellect, attracted the attention, and gained the friendship of Chancellor Wythe, and Governor Brooke, who by their joint advice persuaded him, at the age of nineteen, to undertake the study of the law. To this pursuit he applied himself with great industry and ardour. Soon after being admitted to practice, in the twenty-first year of his age, he removed to Lexington, in the state of Kentucky. Instead of entering immediately upon his professional course, he still confined himself to his legal studies, with the determination of making himself thoroughly master of the great principles of law, before he assumed the responsibility of practice. In taking this course, he showed a remarkable indication of good sense and of sound judgment, especially as there were many things in the circumstances of a new country calculated to excite and call forth, prematurely, his distinguished powers. He wisely laid the foundation, deep and broad, on which he was to build his superstructure of reputation and usefulness. Up to this period, he had never made an effort at public speaking, and was wholly unconscious of his own oratorical powers; although it is said that his style of conversation was universally admired by his associates for its extreme correctness and elegance. The first exhibition of his powers of extemporaneous eloquence was made under peculiar circumstances. Soon after his removal to Lexington, he joined a debating society in that place, but continued, for some weeks, to attend its meetings without offering to take part in its discussions. On one occasion, however, when the vote on an interesting question, which had been the subject of debate, was about to be taken, Mr Clay remarked, in a low but audible whisper, that the subject did not appear to him to have been exhausted. This remark was overheard by several of the members, who, from their high opinion of his powers, had long wished to persuade him to participate in the debates of the society, and they addressed the chairman simultaneously, "Do not put the question yet, Mr Clay will speak." The attention of the society was now, of course, directed to Mr Clay, who, not having sufficient confidence to resist the appeal, arose under extraordinary embarrassment, and commenced his speech by saying, "Gentlemen of the Jury." The members of the society were unwilling to increase his agitation by seeming to take notice of his mistake, and he repeated it several times, in a stammering tone, till, at length, he gradually gained confidence from his own efforts, and, finally, concentrating all his vigorous and disciplined powers upon the subject in debate, he surprised his audience with a beauty and compass of voice, an exuberance of eloquence, and a force of argument, worthy of a veteran orator. His reputation as a speaker was at once established. He immediately became a leading champion in all the debates of the society. It is very evident from this circumstance, that Mr Clay had well employed his time previously. He did not depend upon his genius alone, but upon the results of patient reading and consecutive thinking. The Lexington bar was at that time, undoubtedly, the ablest in the western district of the United States, consisting of George Nicholas, John Breckinridge, James Brown, James Hughes, William Murray, and other eminent men. Notwithstanding the number, experience, and strength of these competitors, Mr Clay soon came to be entrusted with more suits than any rival practitioner. Though well acquainted with the law, during the early years of his practice he was not, in this respect, distinguished beyond some of his competitors. In legal science he had superiors, but, in eloquence and persuasion, none. Though capable of applying the abstract principles of law with great ingenuity and force, his genius was still better adapted to discussions in which the natural powers of intellect were principally called into exercise. The commencement of Mr Clay's political life may be dated as far back as the year 1797. The people of Kentucky were about to call a convention to frame a new constitution for the state; and one feature of the plan which had been submitted to them was a provision for the final emancipation of the slave population. The strongest prejudices of a majority of the people in every part of the state were arrayed against the measure. Mr Clay was aware of this fact, but his sentiments and feelings were on the side of emancipation; and, without taking a moment's heed to his popularity, he entered into the defence of his favourite policy with all the unquenchable ardour of his nature. His vigorous pen was busy in the public journals, and his eloquent voice was raised in almost every assemblage, in favour of the election of men to the convention, who would contend for the extinction of slavery. The struggle was a fierce one; but the advocates of slavery prevailed, and the young champion of liberty and equal rights, who had made the friends of slavery tremble for their ancient prerogatives, became unpopular on account of the part which he had acted. The true principles of slavery were not then understood. The idea of emancipation was new. It alarmed the prejudices of the multitude, and Mr Clay's powerful vindications of it were regarded by many rather as the brilliant but wayward efforts of a young votary of ambition, than as the results of a calm and deliberate conviction of right. But his sincerity in opposing negro servitude has been manifested, with one or two exceptions, in all his public acts. Very frequently, when a coloured man brought an action at law for his liberty, Mr Clay volunteered his services as advocate, and, it is said, never failed to obtain a decision in his client's favour.

The subsequent career of Mr Clay is well known. He has now, for the third time, a seat in the senate of the United States. On the first day of his appearance as a member of the House of Representatives, in 1812, he was appointed speaker by a vote of nearly two to one, over two opposing candidates. To this office he was uniformly re-elected so long as he continued a member. During all this period, including seasons of unprecedented political strife, not one of his decisions was ever reversed, on an appeal from the chair, notwithstanding the energy with which he always exerted his authority. Mr Clay was one of the commissioners who negotiated the treaty of peace between the United States and Great Britain, in 1814. He performed the duties of secretary of state, during the administration of Mr Adams, from 1825 to 1829. He has thus been connected with nearly all the great political questions which have agitated the people of this country for the last thirty years. Hardly any individual has exerted a more extensive influence. Of some of his public efforts, and of the measures which he has advocated, there are different views, according to the circumstances in which different individuals may have been placed. No one will deny to him, however, the possession of most distinguished gifts of nature, and of education; it is therefore more a matter of regret that he has sadly tarnished his character by having been repeatedly concerned in the odious practice of duelling.

Mr Clay has repeatedly expressed himself unequivocally and nobly in behalf of the desolate and outcast Indians and Africans. He thus speaks of the American Colonization Society. "Let us not be disheartened by the little which has been accomplished in the brief space of thirteen years, or by the magnitude and difficulties of the splendid undertaking. In the execution of vast schemes, which affect the happiness and the condition of a large portion of the habitable globe, time is necessary, which, in the estimation of mortals, may appear of long duration, but which, in the eyes of Providence, or in the computation of the periods of national existence, is short and fleeting. We may boldly challenge the annals of human nature for the record of any human plan for the melioration of the condition, or the advancement of our race, which promises more unmixed good in comprehensive benevolence than that of the Colonization Society, if carried into full operation. Its benevolent purposes are not confined to the limits of one continent, nor to the prosperity of a solitary race. They embrace the two largest portions of the earth, with the peace and happiness of both descriptions of their present inhabitants, and the countless millions of their posterity. The colonists, reared in the bosom of this republic, with a knowledge of the blessings which liberty imparts, although now unable to share them, will carry a recollection of them to benighted Africa, and light up in time her immense territory. And may we not indulge the hope, that, in a period of time not surpassing in duration that of our own colonial and national existence, we shall behold a confederation of republican states, on the western shores of Africa, with their congress and their annual legislatures, thundering forth in behalf of the rights of man, and causing tyrants to tremble on their thrones? Confiding in the approving judgment of Divine Providence, and conscious of the benevolence and purity of our intentions, we may fearlessly advance in our great work. And when we shall, as soon we must, be translated from this into another existence, is the hope presumptuous, that we shall then behold the common Father of the white and the black, the Ruler of the universe, cast His all-seeing eye upon civilized and regenerated Africa—its cultivated fields—its coasts studded with numerous cities, and adorned with temples dedicated to the religion of His Redeeming Son—its far famed Niger, and all its great rivers lined with flourishing villages, and navigated by that wonderful power which American genius first applied; and that, after dwelling with satisfaction upon the glorious spectacle, he will deign to look with approbation upon us, His humble instruments, who have contributed to produce it!"*

* Lives of Self-taught Men. Boston, 1831.

POPULAR MORALS.

ANIMAL AND VEGETABLE KINGDOMS.

Having advanced proofs of the existence of a Supreme Being, drawn from various works of creation, and quite apart from Revelation, we now conclude the evidence, by noticing the proofs which may be drawn from the vegetable and animal kingdoms. On this branch of the subject, our authority, Mr Sullivan, proceeds as follows :—

"We are next to notice the works of the Creator in the vegetable kingdom. We include in this all that vegetates, that is, all that grows on, and has a connection with, the earth, by roots.

It is within the notice of most persons that the variation of the seasons is occasioned by the earth's motion round the sun, and the gradual elevation of one pole, and the consequent depression of the other. As there is one region around the centre in which there is perpetual summer, so there is at the poles, alternately, endless winter; and the year is divided into one long day in which the sun never sets, and one long night in which he is never seen. Between this unchanging summer and endless winter, every variety of climate, and of heat, and of cold, and of vegetable productions, is to be found. We must leave to the researches of young aspiring minds to trace out the connection which necessarily exists between this variety, and the enterprise, employment, comfort, improvement, and happiness, of the human race. It would be an easy and pleasing labour to show, that from these sources may be drawn innumerable proofs of the wisdom and goodness of the Creator, in adapting man to use the products of his bounty, and in adapting these products to his use. Still more pleasing would it be to demonstrate, that, principally from this variety of vegetable product, the intercourse and consequent refinement of mankind is directly, or remotely, derived. In short, that, from the vegetable kingdom, more than from any other, and all other sources together, in some form, varied as it may be by art and science, come all the commercial dealings of nations. But this is only incidental to the illustration intended to be made.

It is not our purpose to intrude into the department of natural history. This is a source, no doubt, of pure religious emotion, and of pious reverence, in all its varieties and divisions. We only allude to it, to illustrate the object in view; we do not treat of it, though we know not of any study which is better adapted to enlarge and elevate the mind, and improve the heart of man, than that of the natural world, when engaged in and pursued with the conviction, that we are perusing the volume which God has opened for our instruction, intending thereby to disclose himself through means adapted to our earthly condition.

The vegetable world has this in a manner so peculiar to itself, that it is every where, in every grade, from first formation to decay, pleasing and beautiful to the human mind. Even those vegetable substances which contain, by some unknown law, qualities which are poisonous, pain-imparting, or life-destroying to man, are nevertheless beautiful in their growth and developement. There are general laws prescribed to the vegetable, as there are to the animal kingdom. To these laws, all that is nourished by the earth, refreshed and fed by moisture from the clouds, or warmed and expanded by the beams of the sun, must submit and conform. Yet so varied is vegetable being, that if its varieties were not organized and fitted to render submission and obedience, they could have no place in the scale of creation.

The most imposing object in the vegetable kingdom is the solemn forest. Single trees on a plain, or a sufficient number to form a grove, are objects of beauty, and, consequently, of pleasure. The dark close forest carries the mind back through an indefinite lapse of time, and conveys to it a sentiment of the actual presence of the work of the Creator, as it came from his hand unchanged by any act of man. With this seeming stamp of originality on it, yet the long enduring forest, which appears ever the same, is silently and hourly submitting to the laws of nature, ever varying and changing; and though life, among its members, like life among the members of the human family, has its limits; and within some definite term, not one of all that are seen will remain; yet it is still the forest, to the human eye. From the most deep-rooted and long-enduring of this vast assembly, down to the many perfect vegetables which are invisible to the naked eye, there are general laws of beginning, continuing, and ending the term of life. Yet between these extremes there are many genera, or kinds, capable of definite and well-understood classification. Among these classes each has its own order of being; and these are again subdivided, and known by distinctions of form, internal structure, and in foliage, in flowers, in fruits, in juices, and fragrance. Each of them seems to have been given for some purpose, pleasing, convenient, or necessary to the animal kingdom. This is the inexhaustible treasury for the supply of life, for the restoration of health, for the rejoicing of the senses, for daily necessities, and luxurious gratification.

The continuance of vegetable life, unaided by human ingenuity, is provided for by natural causes. They bear about the germinating influence; yet, however close the neighbourhood of various orders may be, there is no confusion from age to age, nor is the order of nature ever deranged or impaired. It is this regularity of the laws of the Creator that we are called on to reverence. It is the adaptation of vegetable to animal life that commands our gratitude, while it adds another to the many proofs of One infinite and adorable Mind.

On a sphere so variegated as we know our own to be, and forming as we see it does, from its atmosphere, its waters, its minerals, its vegetables, a place fitted for use, and intended to be used, the purpose of Creation would seem to have failed, if it were not inhabited. All those animals which are inferior to man have been most diligently examined, and divided into classes by learned naturalists. The several genera and the species belonging to each have been accurately defined. It is foreign to our purpose to go into detail in this department of natural history. The present purpose will be accomplished if attention can be awakened to some general truths, which prove in this, and in all other parts of created being, the original and continuing presence of the Author of the Universe.

The first fact that strikes us is the exact order which prevails throughout animated being. Each family of the animal kingdom has its peculiar place assigned to it; to that place it is perfectly adapted, and to none other. In that appropriate sphere it comes into being, finds its own share in the created world; in that it continues, and in that it expires. All its instincts, propensities, faculties, pleasures, aversions, enmities, and wars, have their own peculiar objects. For each of these innumerable classes, from the elephant to the smallest mite that the microscope discloses to us on the dried fruit, or the purest lily's leaf, and in the transparent drop of spring water, there are laws of being, far more definite and far more faithfully obeyed than any which proud intellectual man can make and enforce.

It has been objected that it is inconsistent with divine benevolence that some animated beings are necessary to others as food. A moment's reflection will show that this objection cannot be maintained consistently with obvious laws. If some sorts of animals did not prey on others, the common food must be vegetable. Suppose all animals and insects were left to increase in numbers, as we know they would do, and all were to find food from vegetable products, how long would it probably be, before all of them would perish for want of food? Supposing existence a benefit, and considering the numbers that escape destruction, it will be found that this provision, so complained of, is consistent with general laws, and, consequently, with the benevolence of the Deity. In the ocean, if the same law as to food did not prevail, its inhabitants would soon come to an end. It is known that one fish may produce millions of fish. If the increase were permitted according to this scale, and some fish were not consumed by others, it seems that the whole would perish for want of food.

Let us examine two or three instances of the organization of animals. Seeing is necessary to all animals, because all of them are, in some way, connected with objects which are external to them. The law of vision depends on general laws, connected with light, and on the action to which rays of light are subjected, in passing through substances which permit this passage. It might, therefore, seem to us that there must be one sort of construction of the eye adapted to act with reference to one uniform and invariable law of nature. The principle on which vision depends must be the same, in all eyes, that is, on having the image of the object seen transferred through some medium to the sensitive nerve adapted to receive it. The general law, therefore, is this: the existence of the object seen must be in such a relation to the animal seeing it, that its image can be impressed, by the help of light, on the proper space in the interior of the eye. But that which excites our wonder is, the endless variety, among the different orders of being, by which the eye is adapted to its duty, and the means given to preserve it, in a fit state for use. The exceeding sensitiveness of the eye would expose it to irreparable injury, and it might soon be destroyed, if such means were not given. In the human form, in which the hand appears, the injuries to the eye may be remedied by the use of that member.

Among animals which have not that member, nature has provided other means to this end. Birds, generally, and many animals, and the horse among others, have a third eye-lid, the constant action of which may be easily observed, and so curiously adapted to use, that it can be passed over the outer surface of the eye in almost every instant, and by its action all offending substances are wiped away. On examination it is found that this eye-lid moves on mechanical principles well understood, but in this instance marvellously applied.

The keenness of vision in birds of prey, which see at very great distances, and also at very short ones, requires another conformity to the general law. The eye of these animals is, therefore, so constructed, that it can, by means of pliable scales on the outside of the ball of the eye, and by muscles drawn over them, so diminish or enlarge the size of the eye, that it will perform its duty as to an object, however near and distant it may be. This power of vision enables birds to see, from their airy elevation, far beyond the reach of the human eye, over a wide extent, and to discern their food, and with surprising sagacity they submit themselves to the gravitating power, and arrive at the earth's surface with a rapidity which would seem to be necessarily followed by destruction from the contact. This keenness of vision seems to enable them to know whether the object seen is living or dead, though the position of the body may be the same in either case.

Another variation is seen in the *fixed* eye of the insect race, and in the position of it. One or two instances will sufficiently illustrate this. In the common fly are seen two small round projections at the side of the head. These projections contain many thousands of lenses disposed in rows, each one of which is capable of transmitting an impression of outward objects. A German naturalist counted 6236 in the two eyes of a silk worm. Another naturalist counted 14,000 in the eyes of a drone fly, 27,000 in the eyes of a dragon fly. It has been proved by actual experiment with the help of glasses, that each one of these lenses was capable of receiving an independent and distinct impression. The inference seems necessarily to be, that the retina of these insects may receive, at the same time, some thousands of impressions without any confusion, which is far more wonderful than the single impression made on the retina of our own species, and on those of other animals, who have two eyes with a retina for each.

As we have no other purpose than to awaken curiosity and thought in relation to the natural world, we must leave this inexhaustible subject to the inquiring and well disposed. They may feel assured that the thoughtless hours which they pass in early life may be made instructive and happy, if they will examine the natural world, not as a mere show, but as proofs of that Power and Benevolence by which themselves and the minutest insect were alike gifted with existence."

ODDS AND ENDS OF SUBJECTS.

HORNED WOMEN.

An extract from an American journal went the round of the newspapers in 1827, concerning a *horn* which had grown out of the head of a woman of that country. Such a wonderful natural product, although justly described in the journal alluded to as of "very rare occurrence," is not unknown among us in Scotland; for, in the Anatomical Museum of the Edinburgh University, there are preserved four horns, which had grown out of the heads of four different females. One of them is about seven inches in length, as thick as the little finger, of a crooked shape, and has appended to it a label, bearing the following inscription:—"This horn was cut by Arthur Temple, chirurgeon, out of the head of Elizabeth Low, being three inches above the right ear, before thir witnesses, Andrew Temple, Thomas Burne, George Smith, John Smytone, and James Tweedie, the 14th of May 1671. It was a-growing seven yeares, her age 50 yeares." It is rather odd that all these ornaments graced the heads of ladies. But such excrescences have not always been so conveniently placed, as we learn from Sir Robert Sibbald's History of Fife, a curious book published about the beginning of last century. "A person of quality," says that author, "a lady of great age in this shire, had a horn growing out of her toe, and put her from walking; it was cut off by Dr H., and she was freed of pain, and walked."

OVER-FEEDING.

Mr Abernethy agreed with the opinion entertained by Franklin, who said that nine-tenths of the diseases were caused by over-feeding. That learned surgeon, in one of his lectures in 1827, thus addressed his hearers:—"I tell you honestly what I think is the cause of the complicated maladies of the human race; it is their gormandizing and stuffing, and stimulating their digestive organs to an excess, thereby producing nervous disorders and irritation. The state of their minds is another grand cause; the fidgetting and discontenting yourselves about that which can't be helped; passions of all kinds—malignant passions and worldly cares, pressing upon the mind, disturb the cerebral action, and do a great deal of harm."

METHOD OF OBTAINING FLOWERS OF DIFFERENT COLOURS ON THE SAME STEM.

Split a small twig of elder-tree lengthways, and having scraped out the pith, or soft part of the wood, fill each of the apartments with seeds of flowers, of different sorts, but which blossom about the same time: surround them with mould, and then, tying together the two bits of wood, plant the whole in a pot, properly prepared. The stems of the different flowers will thus be incorporated so as to exhibit to the eye only one stem, throwing out branches covered with flowers analogous to the seed which produced them.

DILUVIAL REMAINS.

In a very curious article, by Caleb Atwater, Esq. published in Silliman's Journal, in January 1827, it is said, that fossil plants which are now the natives of torrid climates have been found in considerable numbers in the state of Ohio, America, and in the vicinity of Ohio river. Among these plants are the bread-fruit tree, the species of palm which produces the cocoa-nut, and the bamboo. The writer states, that he has in his possession the perfect impression of the cassia and the tea-leaf, found in the rocks of that region. The impressions of the bread-fruit tree show the flowers fully expanded and entire, and the author avers that these specimens of these fossil plants are so perfect and faithful to nature as to dispel all doubts

of what they once were. The largest trees are found mostly in sandstone. "The supposition," says the author, "that these tropical plants were carried northward by the ocean, is disproved by the fact that some of the trees, or rather the roots, and parts of their roots, and parts of their trunks, stand upright, evidently on the spot where they grew, and others, with every root entire, lie to all appearance where they fell when turned up by the roots. Again," asks the writer, "if floated from tropical regions, how happens it that their flowers were uninjured? These show all their original beauty of form; they are fully expanded, and could not have been transported from any considerable distance. Scarcely a day could have intervened between the period in which they were in full bloom, and that in which, by the catastrophe which long since overwhelmed our globe, they were embalmed in the spot where they are now found."

SAVING KNOWLEDGE.

Instead of cutting off the whole head of a cauliflower, leave a part on, the size of a gooseberry, and all the leaves; second and even third heads will be formed; and thus they may be eaten for two or three months: when, by the present practice, by cutting the head off completely, the bed of cauliflowers are gone in two or three weeks.

LEARNED LADIES.

The following clever bit is from Blackwood's Magazine:—"You shall hear a biped insist on having young ladies taught chemistry, and botany, and natural philosophy, and so on, that they may be fit to become wives to men like himself—himself as great a gapus as gapes—whose knowledge of chemistry gives him reason to suspect that an acid is something infernally sour—whose botanical eye can with difficulty distinguish a dockan—and who in natural philosophy is contented with the old definition of thunder, 'the conjection of sulphur congeals the matter.' Suppose the blockhead were to lay hold of such a wife, what could he make of her? She must forsooth be scientific, in order to be a fit companion for HIM! that, when he returns from business into the bosom of domestic privacy, there may be a partner worthy of HIM—of a man of his fine feelings, and cultivated understanding, and wide range of political, poetical, and philosophical information. How else could he live? His soul must be fed as well as his stomach; and if his better half be not as good as his worse, he dies. The poor prig does not know, that, with all his zeal for female education, he could not do a more fitting, and consistent, and congenial thing, than to marry his cook, all whose natural talents are at least equal to his own, and some of them much more highly cultivated. But we have no personal feelings towards this individual in particular, and are anxious that our observations be considered applicable to the majority of men at large. 'If the majority of our females were well instructed, they would be far before their fathers and husbands, and that would never do. Changes must begin with men, or we shall have all confusion.' Are there twenty men in Edinburgh, ten in Glasgow, five in Paisley, two and a half in Aberdeen, and one and a quarter in Dundee, entitled to a learned wife?"

WHEN TO KILL A LION.

The following curious circumstance is related in Thompson's Travels in Southern Africa:—"I was told here that a lion had just killed an ox, and had been shot in the act. It is the habit of the lion, it seems, when he kills a large animal, to spring upon it, and, seizing the throat with his terrible fangs, to press the body down with his paws, till his victim expires. The moment he seizes his prey, the lion closes his eyes, and never opens them again until life is extinct. The Hottentots are aware of this; and on the present occasion one of the herdsmen ran to the spot with his gun, and fired at the lion within a few yards distance, but, from the agitation of his nerves, entirely missed him. The lion, however, did not even deign to notice the report of the gun, but kept fast hold of his prey. The Hottentot re-loaded, fired a second time, and shot him through the head. This fact, being well authenticated, seemed to me curious, and worthy of being mentioned."

NARRATIVE OF THREE DESERTED CHILDREN.

"I will record in this place," says Mr Flint, in his Travels in America, "a narrative that impressed me deeply. It was a fair sample of the cases of extreme misery and desolation that are often witnessed on the Mississippi river. In the Sabbath school at New Madrid we received three children, who were introduced to that place under the following circumstances: A man was descending the river with these three children in his pirogue. He and his children had landed on a desert island, on a bitter snowy evening in December. There were but two houses, which were at Little Prairie, opposite the island, within a great distance. He wanted more whisky, although he had been drinking too freely. Against the persuasions of his children, he left them, to cross over in his pirogue to these houses, and renew his supply. The wind blew high, and the river was rough. Nothing could dissuade him from this dangerous attempt. He told them that he should return to them that night, left them in tears, and exposed to the pitiless pelting of the storm, and started for his carouse. The children saw the boat sink before he had half crossed the passage: the man was drowned. These forlorn beings were left without any other covering than their own scanty and ragged dress, for he had taken his blanket with him. They had neither fire nor shelter, and no other food than uncooked pork and corn. It snowed fast, and the night closed over them in this situation. The elder was a girl of six years, but remarkably shrewd and acute for her age. The next was a girl of four, and the youngest a boy of two. It was affecting to hear her describe her desolation of heart, as she set herself to examine her resources. She made them creep together, and draw their bare feet under their clothes. She covered them with leaves and branches, and thus they passed the first night. In the morning, the younger children wept bitterly with cold and hunger. The pork she cut into small pieces. She then persuaded them to run about, by setting them the example. Then she made them return to chewing corn and pork. It would seem as if Providence had a special eye to these poor children, for, in the course of the day, some Indians landed on the island, found them, and, as they were coming up to New Madrid, took them with them."

SINGULAR CAPTIVITY.

Mr James Boag, timber merchant, Johnstone, while breaking up a log of American wood, of about twenty-four feet in length, and twenty-eight inches square, in the spring of 1827, discovered in the very centre of it a hollow, in which were a considerable number of living bees, a quantity of honey, and a few larvæ of bees. The imprisoned insects were longer, and of a more attenuated frame than the free tribes that roam over the hills and vallies of Britain. Every care was taken to preserve some of the interesting foreigners alive, but they all died in a short time after exposure to the influence of the atmosphere, hardly tasting the sweets of liberty till consigned to non-existence. The log contained several of these hollows of different dimensions, and in all of them a number of living bees. Some inches of solid timber intervened between each, precluding the possibility of communication between the hapless inhabitants of the various cells. Their incarceration may be attributed to the growth of the tree, which had probably closed up their ports of egress while they were buried in their long winter sleep.

It is to be regretted, in days so prolific of auto-biographies, that one of these trans-Atlantic exiles could not have furnished the booksellers with a narrative of his sensations ere he died. The Bee Family, or a Voice from the Hollow Tree, by an American Wood-ranger, would have formed an amusing addition to our stock of adventure by sea and land.

NATIONAL PHYSICAL FORCE OF ANIMALS.

The account given by M. Dupin, of the physical force of the animals of France, affords a great number of interesting observations. We remark, that the whole animal force of the kingdom is only equal to four times the physical force of the people; while in Britain, the whole animal is equal to eleven times the physical force of the people; whence it follows, that in France the labourers are three times less assisted by animals than the labourers of Britain. In Britain, they have one horse for every ten inhabitants; in France, one for every thirteen. The diligences, or stage-coaches, except on a few roads, travel at the rate of only two leagues an hour, while in England, the same conveyances travel at the rate of three, and even four.

PASSION OF THE INDIANS FOR SPIRITUOUS LIQUORS.

At the treaty of Chicago, in 1821, the commissioners ordered that no spirits should be issued to the Indians, and informed them, in their own manner, that the bungs were driven into the barrels. A deputation of the chiefs was sent to remonstrate against this precautionary measure, and at its head was Topnibe, the principal chief of the Potawatomie tribe, a man upwards of eighty years of age. Every argument was used to convince them that the measure was indispensable; that they were exposed to daily murders; and that, while in a state of intoxication, they were unable to attend to the business for which they were convened. All this was useless, and the discussion only terminated by the peremptory refusal of the commissioners to accede to their request. "Father," said the hoary-headed chief, when he was urged to remain sober, and make a good bargain for his people, "Father, we care not for money, nor the land, nor the goods. We want the whisky. Give us the whisky."

PROGNOSTICS OF THE WEATHER DRAWN FROM ANIMALS.

In a late number of the Journal, we gave some prognostics drawn from animals, under the title of Animal Barometers, of which the following may be regarded as a continuation. These have, from long observation by several meteorologists, been found to afford pretty certain indications of atmospherical changes:—

1. When the bats appear more numerous than ordinary, and fly abroad longer than usual, they announce fine and warm weather on the following day. The contrary is the case when they are fewer than usual, and when they take refuge in houses, and cry.

2. The owl, when it is heard crying in bad weather, is the forerunner of fine weather.

3. The croaking of ravens in the morning indicates the same.

4. It is a symptom of approaching rain and storms, when ducks and geese fly here and there in fine weather, and dive into the water.

5. When the bees make short excursions from their hives, it is a symptom of rain; and it is equally so when they come in swarms to the hive before night, and without being completely laden.

6. If the pigeons return late to the pigeon-house, they announce rain for the following day.

7. It is a sign of bad weather, when the sparrows chirp frequently, and invite each other to flock together.

8. When the hens roll themselves in the dust more than usual, it is a symptom of coming rain; and it is an indication of the same when the cocks crow in the night at extraordinary hours.

9. It is a sign of bad weather, when the swallows skim the surface of the water or the ground; and when they hawk very high in the atmosphere, it is a sure indication of continued drought.

10. A storm is approaching when the flies sting and become more troublesome than usual.

11. When the gnats assemble before sunset, and form a circling mass, they announce fine weather.

12. If the frogs croak more than usual, and if the toads come out in great numbers from their holes in the evening—if the worms appear on the surface of the soil—if the moles labour more than usual—and if the oxen and the turkeys collect together, these prognosticate almost evident certainty of rain.

13. When the cattle in the fields, especially the sheep, are sharper than usual after the grass, rain is not far distant.

14. When cats lick their paws frequently, and rub them over their faces, it is a sure indication of rain.

15. When cattle congregate, and remain in close masses, in an inactive state, it is an indication of the approach of thunder.

PROGNOSTICS DRAWN FROM TERRESTRIAL BODIES.

1. If the flame of the lamp sparkles, or if it forms an excrescence, there will be, in that case, a strong probability of rain.

2. The same happens when the soot loosens and falls down the chimnies.

3. If the coals in the grate blaze more than usual, or flame with more activity, it is a sign of wind.

4. On the contrary, when the flame is steady and uniform, it is a sign of fair weather; when the flame is low and blue, it is a certain indication of frost.

5. If the sound of bells is heard from afar, it is a sign of wind, or of a change of weather.

6. If pleasant or offensive smells are condensed, that is, become stronger, they indicate rain.

7. The frequent change of wind is the forerunner of a violent storm.

8. If salt, marble, iron, or glass, become moist—if the wood of doors and windows smells, and becomes distended—and if the corns on the feet become painful, these are symptoms of rain or a thaw.

9. Those winds that begin to blow in the day time, are always more violent, and last longer, than those that begin during the night.

10. The frost that begins with wind lasts longest.

11. If the wind does not change, the weather seldom changes.

12. If distant objects become more than usually distinct, and appear nearer than usual, it is a certain precursor of rain.

JOE MILLER.

Mr Mathews, in his celebrated Monopolylogue, entitled, "Mathews' Dream, or Theatrical Gallery," gives the following curious and not generally-known anecdote of the well-known Joe Miller, for the veracity of which he pledges himself:—

"It is a fact not generally known," says he, "that Joe Miller, who has fathered all our jests for the last half century, never uttered a jest in his life. Though an excellent comic actor, he was the most taciturn and saturnine man breathing. He was in the daily habit of spending his afternoons at the Black Jack, a well known public-house in Portugal Street, Clare Market, which was at that time frequented by most of the respectable tradesmen in the neighbourhood, who, from Joe's imperturbable gravity, whenever any risible saying was recounted, derisively ascribed it to him. After his death, having left his family unprovided for, advantage was taken of this *badinage*. A Mr Motley, a well-known dramatist of that day, was employed to collect all the stray jests then current in town. Joe Miller's name was prefixed to them; and from that day to this, the man who never uttered a jest has been the reputed author of every jest, past, present, and to come."

THE APPLE.

It is difficult to find adequate terms to set forth the value of the advantages which have accrued to mankind from the cultivation of this justly high-prized fruit. In the woods and hedges of England, the crab and weilding apples are every where found; crooked, hostile, rigid in figure and quality; with numerous small austere fruit, which even the hog will hardly eat; but, transplanted into a garden, and subjected to the corrections of the horticulturist, they have, in the course of time, been divested of their savage character, forming a goodly tree, and yielding crops of goodly fruit, fit for many healthful purposes of life. Many of the newest sorts have been spontaneously produced, and a great number by the art of fertilizing the flowers of one with the pollen or dust of another. One circumstance in the history of the apple must not pass unnoticed here, viz. the deterioration of the old sorts, which regaled and were the boast of our forefathers a century ago. It is the opinion of an eminent orchardist, that, as the apple is an artificial production, and, as such, has its stages of youth, maturity, and

old age, it cannot, in its period of decrepitude, be by any means renovated to its present state, either by pruning or cutting down, changing its place, or by transferring its parts to young and vigorous stocks; and that, in whatever station it may be placed, it carries with it the decay and diseases of its parent. This is the most rational account which has been given of this indisputable fact; and though its accuracy has been called in question by some naturalists, the general failure is in our own orchards, and the difficulties in forming new ones with the old favourite sorts, is a decisive proof that such deterioration exists. It is, therefore, the chief object of the modern pomologist to obtain, from seeds of the best weildings, new varieties, wherewith to form new and profitable orchards, and which may be expected to continue in health and fertility, as the old sorts have done, for the next century. The preservation of this useful fruit is now brought to great perfection, by keeping them in jars, secure from the action of the air; but there is one method of preserving them for culinary purposes, which, as it is not practised in this country, may be noticed here. Any good baking sort, which is liable to rot, if peeled and cut into slices about the thickness of one-sixth of an inch, and dried in the sun, or in a slow oven, till sufficiently desiccated, may be afterwards kept in boxes, in dry places, for a considerable time, and only require to be soaked in water for an hour or two, before using.

SUNDAY AMUSEMENTS.

In an old magazine, printed about the year 1789, the writer, speaking of the persons whose habit it was to resort to the various tea-gardens near London, on a Sunday, calculates them to amount to 200,000. Of these, he considers that not one would go away without having spent half-a-crown, and, consequently, the sum of L.25,000 would have been spent in the course of the day: twenty-five thousand multiplied by the number of Sundays in a year, gives, as the annual consumption of that day of rest, the immense sum of L.1,300,000. The writer calculates the returning situation of these persons as follows:—Sober, 50,000; in high glee, 90,000; drunkish, 30,000; staggering tipsy, 10,000; muzzy, 15,000; dead drunk, 5000.—Total, 200,000.

LINEAL CONSANGUINITY.

It is, at the first view, astonishing to consider the number of lineal ancestors which every man has within no very great number of degrees, and so many different bloods is a man said to contain in his veins as he hath lineal ancestors. Of these, he has two in the first ascending degree, his own parents; he hath four in the second, the parents of his father, and the parents of his mother; he hath eight in the third, the parents of his two grandfathers and two grandmothers; and, by the same rate of progression, he hath one hundred and twenty-eight in the seventh, one thousand and twenty-four in the tenth, and at the twentieth degree, or at the distance of twenty generations, every man has above *a million* of ancestors, as common arithmetic will demonstrate.

GIGANTIC FLOWERS.

The Krubut, or Great Flower of Sumatra.—To this amazing plant has been given the botanical appellation of *Rafflesia Arnoldi*. The first, or generic name, is in honour of the late Sir Stamford Raffles, governor of Sumatra; and the second, or specific name, in memory of Dr Arnold, who discovered the plant in 1818. It is one of the most extraordinary of vegetable productions. It is a parasite, growing in the woods, on the roots and stems of those immense climbing plants, generally of the genus *Vitis*, which are attached, like cables, to the largest trees in the forest. The flower constitutes the whole of the plant, there being neither leaves, roots, nor stems. It is a true parasite, growing out of another plant, in the manner of the mistletoe, and not on the decayed surface of the plants, as the common fern on the trunks of old oak pollards. The flowers, so far as is discovered, are of one sex, and only the male has been sent to England. The breadth of a full-grown flower exceeds three feet; and the petals, or blossom leaves, are of a subrotund shape, and measure twelve inches each, from the base to the apex; and it is about a foot from the insertion of one petal to the opposite one. That part which is considered the nectarium, and situated in the centre of the flower, would hold twelve pints of water: the pistils, which are abortive, are as large as cows' horns, and the weight of the whole is calculated at about fifteen pounds.

The flower fully blown was discovered in a jungle, growing close to the ground under bushes, with a swarm of flies hovering over the nectary, and apparently laying their eggs in its substance. The colour of the fine petals is a brick-red, and covered with protuberances of a yellowish-white. The smell is that of tainted beef. The structure of this plant is too imperfectly known to admit of determining its place in the natural system of botany; but Mr Robert Brown, one of the first botanists in the world, thinks it will be found to approach the passion-flowers.

The first appearance of the plant is a round knob, which, when cut through, exhibits the infant flower enveloped in numerous bracteal sheaths, which successively open and wither away as the flower enlarges; until, at the time of full expansion, there are but a very few remaining, which have somewhat the appearance of a broken calyx. It takes three months from the first appearance of the bud to the full expansion of the flowers. The fruit has not yet been seen by botanists, but is said by the natives to be a many-seeded berry. The female flower differs little in appearance from the male, further than being without the anthers of the latter.

In the observations of Mr Brown on the *Rafflesia*, he remarks, that it is not common for parasitic plants to fix indiscriminately on the roots or branches of their stocks, as is supposed to be the case with the *Rafflesia*, and that plants parasitic on roots are chiefly distinguishable by the imperfect developement of their leaves, and the entire absence of green colour, and their embryo not only minute, but apparently imperfectly developed. The modes of union between a parasite and its supporter or stock, vary in different genera and species of this class of vegetables. Some, as in the mistletoe and *Rafflesia*, depend on the stalk for nourishment, during the whole of their existence; others, as the common broom rape, are originated in the soil, and, afterwards, when they have attached themselves to their stock, and in their more advanced state, produce roots of their own. In some cases the connection between the parasite and the stock is such as can only be explained in the supposition that the germinating seed of the parasite excites a specific action in the stack; and the result of which is a formation of a structure, either wholly or in part derived from the root, and adapted to the support and protection of the undeveloped parasite; analogous, therefore, to the production of galls by the puncture of insects. On this supposition may be explained the connection between the flower of the *Rafflesia* and the root from which it springs.

The Hydrangea Hortensis.—This inimitable plant is one of the most superb in nature. The Earl of Selkirk had one in his fine garden on the beautiful domain of St Mary's Isle, which excited the admiration of all florists, was, before the year 1827, several times cut down, and as often started into fresh luxuriance; and in August of that year was in full and extraordinary bloom, measuring round the extremities, as near as possible, thirty-two feet, and displayed *five hundred and twenty-five* flowers, and, what is perhaps equally surprising, several of which measured not less than two feet in circumference.

VALUE OF AN AFRICAN WIFE.

Some English settlers in South Africa, in a hunting excursion across the frontier, were entertained at a kraal of the Amatymba Caffres. The chief inquired how many wives an Englishman usually had, and how many cattle were required to be paid for one. He was told that no man, not even the king himself, was allowed to have more than one wife; and that property was not given *for* them, but, on the contrary, expected *with* them. "You are a people of strange customs," said the Caffre; "among us, no man can procure a tolerable wife for less than ten good oxen, and our chiefs sometimes pay sixty cattle for one of superior qualities. Your women, I fear, make but indifferent wives, since no one will pay for them, and their relatives must even pay the man to marry them off their hands."

EXTRAORDINARY PRODUCE.

In the year 1827, there grew on the farm of Bents, parish of Kirkmichael, Dumfriesshire, a root of rye, size of a Portugal onion, from which sprung sixty-six stalks, each provided with a well-filled head. It was allowed to ripen, and when pulled up, the grains were counted, and found to amount to the amazing number of *four thousand and ninety-six* pickles—perhaps the greatest quantity ever produced from one grain of rye. Mr Crow discovered the plant early in the season, and many witnessed the phenomenon when growing.

FUNERAL CEREMONIES OF THE ARABS.

The Arabs, who set little value on the lives of mankind, respect their remains, and take the utmost care of their interment; the want of it they consider one of the greatest misfortunes that can happen, and they die with composure when they are certain of leaving some one behind them to bury them. The severest punishment, therefore, among them is to be cut to pieces, and thrown to the dogs. Their funeral ceremonies, as far as I have had an opportunity to observe them, are as follow:—Scarcely has the Arab breathed his last, when his body is carefully washed; after which it is wrapped up in a winding-sheet of white cloth, reserved by the Arabs for that purpose. This cloth is manufactured in the town of Arabia; but they set a much higher value upon that which is brought them by pilgrims from Mecca, and which has been blessed by the principal Iman. This benediction is expensive, it is true; but the singular favours annexed to it make them forget what it costs. As soon as the dead body is purified, it is laid upon a kind of litter, and is carried to the place of interment, either on horseback, or by the friends and relations of the deceased. While the men are employed in digging the grave, the women squat down in a circle around the body, which they feel and uncover, and afterwards converse together with much indifference; but every now and then they break off their discourse, to give vent to their lamentations, to ask the body questions, to beseech it, in the most earnest manner, to return again and take up its abode amongst them. "Why," say they, "hast thou quitted us?" Did we not prepare thy *courcouson* well? Alas! shall thy children behold thee no more? At present, since thou hast plunged them into sadness and woe, nothing remains for them but to sigh and to weep. Ah! return again with us; nothing shall be wanting to thee. But thou hearest us no more; thou no longer givest us an answer to our words; thou hearest only our sighs," &c., and other expressions of the same kind, which I have often made the Arabs translate to me, whilst I was assisting at these mournful ceremonies. These dismal lamentations, which display a natural and pathetic eloquence, would have a powerful effect in moving the hearts of the spectators, did they not see these very women, a moment after, throw aside that external appearance of the deepest grief, talk and laugh together, and afterwards return to their former wailings. During these tender complaints, they tear their hair, and open the veins of their temples with their nails, while the blood trickles down, mingled with their tears, and exhibits an appearance of the deepest despair. When the grave is finished, the body is deposited in it on its side, and with the face turned towards the east. One of their *papas* puts into its hand a letter of recommendation to Mahomet; after which a kind of arch is formed over it with branches of trees, in order that the earth may not touch it. When the grave is covered with earth, other branches of trees are laid over it, with a quantity of large stones, to prevent savage animals from devouring the body in the night time. In the middle of the stones, an opening is left where they deposit earthen vessels, and other family utensils; but this is only done to Arabs of a certain rank. Before they quit the grave, they erect in the middle of it a kind of funeral flag, which is generally a piece of the clothes of the deceased, fixed to the end of a stick. When the ceremony is finished, each returns home with the greatest tranquillity, and without showing, in their exterior appearance, any signs of the melancholy duty they had been discharging. The nearest relations and friends of the deceased go, from time to time, and visit his tomb. They remove some stones from it, and in part uncover the body, to see that the person has not returned to life; and when the smell convinces them of the contrary, they renew their wailings and lamentations as above described. Some scatter a little lime over the stones, to make this rude tomb look somewhat brighter. On every holiday the Arabs go in crowds to visit the tombs of their dead, and to bedew them with their tears.—*Poiret's Travels*, 1773.

PORTRAIT PAINTING.

A portrait painter in large practice might write a pretty book on the vanity and singularity of his sitters. A certain man came to Copley, and had himself, his wife, and seven children, all included in a family piece. "It wants but one thing," said he, "and that is the portrait of my first wife—for this one is my second." "But," said the artist, "she is dead, you know, sir; what can I do? she is only to be admitted as an angel." "Oh, no! not at all," answered the other; "she must come in as a woman—no angels for me." The portrait was added, but some time elapsed before the person came back: when he returned, he had a stranger lady on his arm. "I must have another cast of your hand, Copley," he said: "an accident befell my second wife; this lady is my third, and she is come to have her likeness included in the family picture." The painter complied—the likeness was introduced—and the husband looked with a glance of satisfaction on his three spouses. Not so the lady; she remonstrated; never was such a thing heard of—out her predecessors must go. The artist painted them out accordingly, and had to bring an action at law to obtain payment for the portraits which he had obliterated.—*Life of Copley, Family Library.*

ON A SLEEPING CHILD.

From "Sonnets, by Edward Moxon." 1830.

Sleep, infant Pilgrim! Over thee one bends,
Too anxious for thy being, thee to rob
Of one sweet dream. Surveying thee, the throb
Of future years steals o'er me; yet hope blends
Her lilies with fear's dark contrasted flowers.
Long may the former bloom for thee, meek child,
And oft repeated be these slumbers mild
Which now so softly lull thy cherub hours.
Thou, like a flow'ret of the virgin May,
In lusty beauty puttest forth a ray,
Which time will brighten till thy noon arrive,
As summer to the offspring of the field.
Storms thence against thee their wild course will drive,
And, like the flower, thou to their strength must yield.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 65. SATURDAY, APRIL 27, 1833. PRICE THREE HALFPENCE.

TEA AND SUPPER.

"I hate your immense loads of meat; that's country all over. Something nice and a little will do."—GOLDSMITH'S *Essays*.

SUCH was the saying of the exquisite Beau Tibbs; and whether with or without a cautious regard to the scrankiness of his larder, whether from real taste or from economy, there was certainly much propriety in the remark. The more formal the party—the more immense the preparation—the more weighty the load of meat and vessels—just so much less chance is there of that light-hearted hilarity, that social and cordial union, which forms the charm of a miscellaneous party. From a conviction of this, but without any positive knowledge of what does constitute a pleasant meeting, many persons abjure dinner-parties, as liable to all the objections we lately stated against them, and seek for ease and felicity in invitations styled technically *at homes*, which implies tea and supper. No doubt such people are safer here. Tea and supper generally require candles, by which there is always more sociality than under the business-like thing called day-light. This is so much in favour of the hopes of the inviters. Then, tea and supper always implies the drawing-room in the first instance, where there is likely to be a little more ease than in the fixed parallelogram of sitters, which distinguishes the dining-room. This is so much more. *Between* tea and supper, moreover, there is more variety of conversation, more variety of amusement, and a greater chance of the various divisions of the company becoming coherent, and agreeable to each other, than in any part of the penitential solemnity styled a dinner. All these advantages, however, will be in a great measure lost, if a proper attention be not paid to the selection of the guests. A meeting of Blacks and Whites, and Slaters and Wrights, all in pairs, called together for the mere commercial purpose of clearing off so many debts, and unrelieved by any admixture of good talkers and good singers, would freeze the nectar, and poison the ambrosia of the immortal gods.

A dinner-party is generally gone into with one's eyes open: a tea and supper party is often a matter into which one is betrayed. Some day, your wife mentions to you, quite in what Mrs Pringle called an overly way, that she happened to meet her old friend Mrs Nicholson on the street that day, and, not having seen her for a good while, had asked her to come up next Friday night, bringing the Misses Nicholson along with her—just in an easy way. This passes as a very simple matter, and there is no more thought about it for some time. However, meeting a friend or two of your own whom you have not seen for a long while, and recollecting that there is to be somebody with you next Friday at any rate, and that you will therefore be unable to attend to any business that evening, why, you ask your two friends to come too, as it will make little difference whether your guests be three in number or five: besides, as your wife sagely remarks, "these two young gentlemen will be company to the Misses Nicholson." That afternoon you are informed by Mrs B., that, recollecting a particular school acquaintance, whom she had not seen for many years, but who was now spending a few days in town with Mrs Armstrong, she had sent to invite her with the said Mrs Armstrong, and Mrs Armstrong's son and niece, for the same evening. The affair now begins to look serious, and you half think, with Bucklaw, in the Bride of Lammermuir, that it will be as well just to make a night of it. Having ultimately resolved upon this course, you set your wits to recollect others whom it would be "as well" to invite on the present occasion, and "so," as Mrs B. remarks, "be done with all parties for the winter." "Since we are to have so many at any rate," says your truly wise helpmate, "it will be best to make up a good set when we're at it—for, in an evening affair, you know, a few more does not make much difference." There is then a hurry-skurry issue of notes to this one and that one, whom you were not at all thinking of inviting till this opportunity occurred, and who, good souls! would far rather stay at home than thus be dragged at the chariot-wheels of your conveniency. Some can come, and some cannot; and, on summing up the acceptances, and finding that one or two more could still be taken in, why, in all probability nothing will please Mrs B. but she will call upon several formerly omitted individuals—the very newest, or the most forgotten of your acquaintance—and ask them in an easy way, "as it is now too late to send notes." Thus, instead of simply having the Nicholsons, in a quiet way, as you first thought, you get packed to the door with a brilliant assemblage, the half of whom are hardly known to either you or your spouse, but are mutually supposed to be each other's acquaintance, and who are no more amalgamable into a friendly composition, than the company at a sale or a picture exhibition.

In such *soirees* as this, the whole affair becomes a painful kind of *solemnity*, rather than what it ought, or is expected to be. Instead of cultivating, as you desired, a better acquaintance with certain persons, and enjoying with them an interchange of ideas and feelings, such as friendship demands, you see them all the while (if you see them at all) in a kind of masquerade. No one appears in his natural character. The manners are stiff and artificial—unirradiated by a single trait or *escape* of real human character. The conversation, from the mutual non-acquaintance of the individuals, is necessarily general, referring to all kinds of hack exhausted subjects, such as the theatres and the picture exhibitions: if any man alludes to a somewhat more extraordinary public amusement which has just come to town, the whole catch at it, like drowning people grasping at straws, and seem to take a sincere interest in it, while, in reality, they are only anxious to relieve the desperate dulness of the scene they are involved in. In fact, a request to snuff the candles is often a relief on such occasions; and if any one can tell about such a thing as Mackenzie's theory of the weather, his neighbours hang upon his blessed lips, like an excited multitude when addressed by a popular orator. One might become quite *distingué* on such occasions by a jest upon a cheese-paring. Any thing—any thing will do—only let some one speak something loud enough to be heard by the rest. How fortunate on such an occasion is the recent occurrence of some great public transaction, even though it be of the nature of a calamity or accident, which may supply a few points of remark to the unhappy assemblage. If you had not had that—so run your thoughts at the end of the evening—you would have had nothing, and the whole affair must have been passed in something little short of absolute silence. From this difficulty of conversation, people often sit for hours at a supper-table, eating and drinking of the very best productions of the earth, and yet all the time inwardly experiencing the most awkward and the most unpleasant sensations. They begin to think themselves trepanned into some ridiculous scrape or dilemma, and see the full force of honest Sancho's wish—that he might be permitted to eat garlic and crusts behind a door, rather than feast in public. But all this is nothing to the attempt usually made to get some one to sing. Horace said, nearly two thousand years ago, that no *private* singer could ever be got to sing when asked, but that, when not asked, they never give over *—and the same thing is seen in our own day. Often have we seen half an hour spent, in a stiff miscellaneous party, like that we have been describing, before either lady or gentleman could be prevailed upon to waken the awful echoes of such a scene with a song: every one, regularly as asked, becomes suddenly affected by a grievous catarrh, or, as Signor Corri used to call it, "a leetle horse at de trot;" and unless some one can tell upon another, which is not likely in such a collection of strangers, there is no finding out a singer either by physiognomy or phrenology. At last, perhaps, some unhappy young creature in gauze or muslin is badgered out of all resistance, and fairly forced to squeak up some modern sentimental ditty, which she occasionally practises confidently enough to her piano-forte at home, though here she is like to sink into the earth at the very thought of whispering it. Up it goes, however—the most miserable caterwauling that ever was heard. Probably the song implies some passion of no small vehemence, or describes a situation in the highest degree moving. The contrast, then, between the meaning of the words, and the poor, peepy, fainting, tremulous, expressionless voice in which they are given—not to speak of various break-downs in the most emphatic parts of the performance—produces such a depressing effect upon the audience, as surpasses all description. You all feel that you have been instrumental in making a fellow-creature ridiculous, and, if you have any real generosity, execrate yourselves for the very pity which you find yourself called upon to bestow upon her.

Upon such *enjoyments* as these, the wealthy and the easy in circumstances annually expend much money, without giving either themselves or others the least real pleasure—the expenditure being solely dictated by a desire of *showing off*, or of proving their wealth and dignity before certain persons, whose good word may elevate the spenders in the scale of society. The sacred idea of hospitality and social intercourse is thus abused, that the vulgar idea of opulence may be advanced: the most valuable products of nature are brought forward and liberally distributed, not that they may cheer or recreate the individuals called together—whether thrown over the throats or under the feet of these individuals is a matter of indifference: the only object is, that, *by their being used*, something may be argued in favour of the parties bringing them forward. We have often thought that if the money thus expended in regaling those who are already in no need of regalement, were bestowed upon the poor—or if even a fifth part of it were so expended—the condition of the humbler classes of society would be much alleviated, while the giving class would not experience the least decrease of real comfort. At the same time, it might reconcile the poorest man to his condition, to see how much of the wealth he perhaps envies is spent under the influence of an infatuation from which he is exempt, upon feasts which, unlike Mercy, bless neither the giver nor the receiver, and are just a means of rendering a certain number of persons miserable in themselves, and odious to each other, for a certain number of hours. The crust of the labourer carries with it a relish and a blessing which rarely befall costly banquets, and there is often more real joy and social mirth over the humble potation which one embrowned hand will pass to another in the intervals of a grinding toil, than over the most delicious liquors which "respectable people" think

* Omnibus hoc vitium est cantoribus, inter amicos,
Numquam, rogati, &c.

they may innocently indulge in, while they censure and bewail the infinitely smaller indulgences of the poor. There is a balance of comfort in this, which shows that Providence has more nearly equalised the happiness of various classes of its creatures than is generally imagined.

The *improvement* which we promised upon this subject must now be attended to. It has been shown, we think, that there is no pleasure in either dinners or later and lighter entertainments, if the object be merely to give meat and drink to certain persons, or to sacrifice money in compliment to them. Some higher moral views must enter into the design. We must have the wish of increasing or keeping alive a kindly intercourse with certain fellow-creatures, whom we hold in esteem, and from whose company we experience advantage. We must aim rather at social intercourse than at either eating or drinking; above all, the idea of flattering or pleasing them by a large expense on their account, must be discarded. If we really desire to see such persons in our house, so as temporarily to form *one family with them*—for there is the secret of hospitality—we must invite them to such an entertainment as our own family may be supposed to partake of on the *better days of the week*—or perhaps a *little better* than even that—but in no case much; and then they will be at their ease with us, will enter into all the familiar converse which gives home its habitual charm, and will afterwards, in their own secret minds, respect us for the moderation of our style of living. It is also necessary that they should be invited in such parcels as are convenient to us, and agreeable to themselves. Persons of the same order in the world, and, if possible, acquainted a little with each other, but, above all things, likely to take well to each other when they have been made acquainted, ought to be selected. One alien character has often spoilt the best concocted parties; and it is equally unfortunate when the individual is much above, as when he is much below the general level. It may not also be amiss—especially if you are not yourself of a sprightly turn—to have some clever person, who may act as what the Germans call a *spruche sprecher*, or sayer of smart things, and so make up for your own quiescence, and that of other individuals in the company. A man of this kind becomes like a golden string to bind the incoherent members of the association together, and his good offices are too commonly necessary in this sombre island. Music is another means of amusing a miscellaneous party: few are not susceptible of pleasure from this source, and it is in general easily provided. Cards we consider, upon principle, as a vicious means of wasting time, not to speak of other evils which beset them. But as it were vain for us to attempt their expulsion from society, we neither recommend nor forbid them.

By proceeding upon moderate views like the above, we believe that entertainments of various kinds may be given, without producing much discomfort in any quarter, and with the chance of much increasing, for the time, the happiness of all parties. But it is almost vain to legislate upon the subject. Even those who may allow the force of our observations are still likely to be so much under the trammels of custom, that they will go on rendering themselves and others miserable by large showy feasts, merely because it is what society looks for. So long as human nature is liable to appreciate the means above the end, mahogany will be loaded with unenjoyed viands, and men and women reduced below the ordinary standard of cheerfulness, by being obliged to sit around it for a certain length of time, looking with a certain silly arrangement of the facial muscles, and talking (if they talk at all) at a certain degree of smallness and nonsensicality. Evil principles in the hearts of men we could hope to correct; but any thing that bears the sacred impress of custom, although in the most trivial details of life, makes us despair.

NATURAL HISTORY.

QUADRUPEDS.

We come now to treat of the fourth order of quadrupeds, called by Cuvier Feræ, or animals whose four legs are formed for walking; they have three kinds of teeth, with teats on their abdomen, varying in number, and having a single membranaceous stomach, and short intestines.

The species of this order live chiefly on animal matter, and this more exclusively, as their molar teeth are formed for cutting. The species which have these teeth partly or wholly formed with tubercles on their surface, subsist more or less on vegetable substances; while, on the contrary, those which have sharp points on their upper surface, live chiefly upon insects, and also on the smaller kinds of animals. Their lower jaw is articulated crosswise, and shuts like a hinge, which prevents it from having a horizontal action, the motion being limited to opening and shutting, that is, they cannot grind their food like man, or animals of the horse, cow, and the sheep kind. The predominating sense of the order seems to be smell.

The first family of this order are insectiverous animals, having their fore-feet armed with stout nails; the hind feet have always five claws, and the soles of their feet bearing upon the ground when walking or standing. The fore-feet have also usually five toes, although to this there are some exceptions. The surface of the grinding or molar teeth is always crowned with sharp tubercles; the canine teeth in some of the species are sometimes very long, and at others very short. Their bodies are either covered with hair or prickles.

The Hedgehog inhabits most of the temperate countries of Europe, frequenting hedgerows and thickets. Their usual food is fruit, roots, snails, insects, and flesh; they are also very fond of eggs, and will sometimes enter a hen-house, and drive the hen from her nest, and devour the eggs. That they feed on flesh is denied by some naturalists even to the present day, which we think the more surprising, as Buffon stated this fact. He says, speaking of tame ones, "they ate caterpillars, beetles, and worms, and were also very fond of flesh, which they devoured either boiled or raw." It has now been satisfactorily proved that they prey upon live animals, as Mr Woodcock, surgeon, Bury, Lancashire, found one with a live toad in his mouth, the head and one of the legs of which were consumed: and, in 1819, a labouring man of the name of Copland, on the lands of Terraughty, Dumfriesshire, overheard a sound which led him to believe a hare was in jeopardy from the attack of some unknown enemy; the squeaking, however, soon terminated; and, after searching carefully in all directions, he detected a leveret lying dead by the side of a hedgehog. He had, however, coiled himself into the form of a ball on hearing footsteps advancing. Copland was so enraged at the sight, and being convinced the poor leveret had been burked by the hedgehog, that he instantly despatched him with a hatchet which he had in his hand. Mr Lane, gamekeeper to the Earl of Galloway, mentioned, in 1818, having seen a hedgehog cross a road, carrying on his back six pheasants' eggs, which he had pillaged from a nest hard by.

The hedgehog is not that stupid animal which many suppose it to be, as it has been trained to some curious tricks, and also becomes very domesticated. Mr Sample, of the Angel Inn, at Felton, Northumberland, had a tame hedgehog, which turned a spit as well in every respect as the dogs of that name which have been trained to the occupation.

Plutarch mentions a curious incident of a citizen of Cyzicus, who acquired the reputation of being an astonishing meteorologist. He discovered that a hedgehog generally has its burrow open at various points; and, warned by an instinct of an approaching atmospherical change, he stops up the opening next the quarter from whence the wind is to blow, and thus could predict to a certainty to which quarter the wind would shift.

The Mole.—Nature, ever wonderful in the adaptation of her forms to the situation which she intends an animal to fill, has given to the mole a formation which admirably fits it for burrowing, and digging its way under the ground. The bones of the animal are articulated together, so that there are no projections, and the whole are covered by a thick coat of very close-set velvety fur. The fore-feet of the animal are extremely large in proportion to its body, and in the form of the palms of the human hand, being broad and naked, and provided with very large broad nails, concave on the under side, and united to the bones; in place of a thumb, they have a large and strong bone under the skin; the hind-feet are very small, with five slender toes, and a small thumb on the inside. The mole digs with astonishing rapidity, and if surprised while it is out of the earth, it disappears in a few seconds.

Moles are very savage in their nature, and will attack animals much larger than themselves. An experiment was tried to ascertain the courage of one, by confining it in a glass case, along with a viper and a toad; the mole killed both, and devoured part of each.

Mr Arthur Bruce records, in the Linnæan Transactions, a circumstance which appears to have been before unknown—that of the mole being addicted to swimming. We shall give the account in his own words:—"On visiting the Loch of Clunie, which I often did, I observed in it a small island at the distance of one hundred and eighty yards from the nearest land, measured upon the ice. Upon the island, the Earl of Airlie, the proprietor, had a small castle and shrubbery. I remarked frequently the appearance of fresh mole-casts, or hills. I for some time took them for those of the water mouse, and one day asked the gardener if it was so. 'No,' he said; 'it was the mole; and that he had caught one or two lately.' Five or six years ago, he caught two in traps, and for two years after this he had observed none. But, about four years ago, coming ashore one summer's evening in the dusk, he and the Earl of Airlie's butler, they saw at a short distance upon the smooth water some animal paddling towards the island! They soon closed with this feeble passenger, and found it to be the common mole, led by a most astonishing instinct from the castle hill, the nearest point of land, to take possession of this desert island. It had been at the time of my visit, for the space of two years, quite free from any subterraneous inhabitant; but the mole has, for more than a year past, made its appearance again, and its operations I have since been witness to."

In the Magazine of Natural History, Mr H. Turner mentions a circumstance similar to the above account: he says, "Last summer and autumn (1831), I visited a river at the bottom of the Botanic Garden of Bury St Edmund's, several times very early in the morning, and late in the evening, for the purpose of procuring a specimen of the kingfisher, to preserve, which is frequently to be met with here. One morning, as I sat very quietly, I observed a mole come out of an osier holt and run across a grass path, and take to the water: when it was about half across the river, I ran to the edge of the water, and the mole then made a perceptible attempt to dive, but merely immersed his nose in the water for half a minute, and rapidly gained the shore, and soon disappeared in a hole of the bank. A few mornings afterwards I saw it take to the water as before, but as I remained perfectly still, I observed its unrestrained actions. It was nearly four minutes in swimming six yards, and appeared as if it rather enjoyed its morning's bathing. I mentioned this to an old mole-catcher, as I thought it rather singular, who replied, "I've seen 'em swim across rivers of a devil and all of a width."

The mole shows changes of weather. The temperature or dryness of the air governs its motions as to the depth at which it lives or works. This is partly from its inability to bear cold or thirst, but chiefly from the necessity of following its natural and ordinary food, the common earth-worm, which always descends as the cold or drought increases. In frosty weather, both worms and moles are deeper in the ground than at other times, and both seem to be sensible of an approaching change to warmer weather, before there are any perceptible signs of it in the atmosphere. When it is observed, therefore, that moles are casting hills through openings in the frozen turf, or through a thin covering of snow, a change to open weather may be shortly expected.

The cause of this appears to be: the natural heat of the earth, being for a time pent in by the frozen surface, accumulates below it; first incites to action the animals, thaws the frozen surface, and at length escapes into the open air, which it warms and softens, and, if not counterbalanced by a greater degree of cold in the atmosphere, brings about a change Changes from frosty to mild weather, caused by the ascent of heat from the earth, are often so evident, that the circumstance needs no confirmation. Stronger proof, if proof were necessary, cannot be given than the common appearance of frost or snow remaining longer upon ground having a stratum of rock beneath, than upon that where there is none. Old foundations of buildings which have not been dug out are easily traced by the same appearance; and any subterraneous solid body, as large stones, drains, planks, or pieces of timber, may be discovered in the same way; and even a plank laid across a ditch, at such times, will remain covered with snow for many hours after the snow on the ground is all melted and gone.

This sufficiently accounts for the activity of the mole before a change of weather, and deserves to be noticed by the meteorologist among the other prognostics of the weather.

The mole is frequently of much more use to the agriculturist than he imagines, as it drains his lands by natural means, and destroys worms. Mr James Hogg, the Ettrick Shepherd, makes the following remarks on this subject:—"The most unnatural of all persecutions that ever was raised in a country, is that against the mole—that innocent and blessed little pioneer, who enriches our pastures annually with the first top-dressing, dug with great pains and labour from the fattest of the soil beneath. The advantages of this top-dressing are so apparent, and so manifest to the eye of every unprejudiced person, that it is really amazing how our countrymen should have persisted, now nearly half a century, in the most manly and valiant endeavours to exterminate the moles from the face of the earth. If a hundred men and horses were employed on a common-sized pasture farm, say from fifteen hundred to two thousand acres, in raising and conveying manure for a top-dressing of that farm, they would not do it so effectually, so neatly, or so equally, as the natural number of moles on that farm would do themselves."

Moles have openings placed for air at certain and very uniform distances.

The mole is a cruel, voracious beast, satisfied only with animal substances, and easily killed by hunger. None of them can remain more than twelve hours without food, and, even after an interval of six hours, they are much exhausted. Although worms and insects are their ordinary food, if they can catch a bird, a small quadruped, or a frog, they precipitate themselves on it with fury, open the belly, devour the entrails, pulling the edges of the wound asunder, and penetrating as far as possible into the body with

being diverted from their purpose by the presence of man, or noise. They do not even spare their own species; and if two are shut up together without food, there will shortly be nothing left of the weakest but its skin, slit along the belly.

THE HERMIT OF MANOR.

So lately as December 1811, there died, in the vale of Manor, in Peeblesshire, an aged individual, who had exhibited, during his life, nearly all the features and habits of the extinct species called a *hermit*. The name of this person was David Ritchie. He was deformed, and a pauper; yet he possessed a strength of mind and a strength of sentiment, together with a share of literature, and, in some things, good taste, such as singled him out not only from his fellow men in that pastoral district, but from the herd of the human race. He was born of poor parents, in the parish of Stobo, adjacent to Manor, about the year 1740—his father's name being William Ritchie, and that of his mother Annaple Niven. He had himself the impression that his deformity was owing to carelessness on the part of those entrusted with his keeping in infancy; but this must have been a mere appliance, suggested by self-love, for the gratification of wounded vanity, as his personal defects bore the decided appearance of being inherited from nature. They were confined to his limbs, which were not only shorter than usual, but were bent outwards in such a way as to resemble rather the fins of the turtle than the locomotive enginery proper to the human being. The other parts of his body displayed not only a fully-developed, but an extremely muscular and powerful organization—a circumstance, however, which only aggravated the repulsive singularity of his appearance. David's physiognomy was of a piece with the unnatural structure of his person. His visage was long, meagre, and attenuated; his features large and prominent; his chin projecting far beyond the upper part of his face. From the tip of the latter feature, indeed, to his forehead, his countenance exhibited a progressive slope backwards. His complexion was coarse, hairy, and of a tan colour; and the only redeeming points of his grim aspect were his eyes, which were black, animated, and expressive. When, to the personal qualities just enumerated, we add a voice of a most unearthly pitch and compass, resembling more the utterance of the screech-owl than the tones of humanity, our readers will be at no loss to figure to themselves an object sufficiently disgusting. We have thought it proper thus to describe, at the outset, the extraordinary animal economy of this individual, as an acute sense of it, operating upon a mind peculiarly sensitive, seems to have been the chief, if not the sole cause of that misanthropic disposition which he displayed through life.

David was sent, while yet young, to Edinburgh, to learn the trade of brush-making; but whatever inclination he may have had to follow out that occupation, he soon found his residence in the midst of a populous community altogether intolerable. A propensity not only to slight and contemn, but actually to persecute those unfortunate creatures, whose mental or corporeal functions have been "curtailed of their fair proportions" by nature or accident, seems ever, we are sorry to say, to have been a characteristic of the younger portion of our northern community. The extraordinary physiognomy and person of David, accordingly, soon procured for him such a degree of notoriety, generally manifested, too, without the smallest sympathy or regard for the poor creature's feelings, that he speedily abandoned the town, and fled (if we may use such an expression in speaking of him) to his native hills, his heart bursting with the bitter sense of insulted manhood, without the ability either to bear or to retaliate—filled at once with rage against his tormentors, and disgust at his own misshapen features and person, which thus cruelly excluded him from the pale of social life, and resolved to separate himself for ever from all intercourse or communion with his fellow men.

How David subsisted for some time after his return to his native place, we never heard; but he probably found a shelter in his father's cottage, for we have been informed, that almost immediately after the death of the latter, he began to erect his future hermitage. The place he pitched on was a patch of wild moorland, lying at the bottom of a steep bank, on the farm of Woodhouse, in the vale of Manor, Peeblesshire. Whether David asked or obtained the leave of the proprietor for this proceeding, does not seem quite clear; but certain it is, that the latter, so far from molesting him in his possession, ordered his servants to give him every assistance he might require in the construction of his habitation. Of such aid, however, David availed himself as little as possible, seemingly taking a pride in being the fabricator of his own abode, which, although small, he put together with an extraordinary degree of solidity, the walls consisting of alternate layers of large stones and turf. He covered his miniature dwelling with his own hands, with a neat thatched roof. The door was only three feet and a half high, beneath which he could with ease stand upright. After the completion of his dwelling, David next proceeded with the cultivation of his little garden, which was partly scooped out of the bank behind, and which he had previously enclosed with a strong stone wall. His horticultural labours did equal credit to his taste and industry, and in a short time it was stocked with all sorts of flowers, herbs, and culinary vegetables, as well as fruit-trees. His feet being of no use to him in the process of digging, he forced the spade into the earth by applying his breast to it. He soon after procured some bee-hives, which he tended with great care, and these speedily became to him a source of considerable emolument, as well as amusement. David's hermitage, both from its own romantic and beautiful appearance, and the singular character of its inhabitant, soon attracted numerous visitors; and it would appear, that to these the poor man evinced much pride and gratification in showing off the results of his taste and handiwork—always providing that they addressed him without any marks of either surprise or disgust at his appearance, and in the courteous manner due to one who had something to show. Among his visitors was the late Dr Adam Ferguson, Professor of Moral Philosophy in the University of Edinburgh, and historian of the Roman republic, who resided at the neighbouring mansion of Hall-yards. In the year 1797, Sir Walter Scott, then a young barrister, paid a visit to the venerable professor, with whose family he was at all periods of his life very intimate; and, among other curiosities of the district, he was taken to see the dark hermit of Woodhouse. On this occasion, he was accompanied by Mr (now Sir) Adam Ferguson, the eldest son of the professor, who has been so kind as to communicate to us the particulars of the interview. It may be mentioned, once for all, that David afterwards figured as a fictitious character in one of the celebrated novels of his visitor, under the name of *Elshender the Recluse*.

At the first sight of Mr Scott, the misanthrope seemed impressed with a sentiment of extraordinary interest, which was either owing to the lameness of the stranger—a circumstance throwing a narrower gulf between this person and himself, than what existed between him and most other men—or to some perception of an extraordinary mental character in this limping youth, which was then hid from other eyes. After grinning upon him for a moment with a smile less bitter than his wont, the dwarf passed to the door, double-locked it, and then, coming up to the stranger, seized him by the wrist with one of his iron hands, and said, "Man, ha'e ye ony poo'er?" By this he meant magical power, to which he had himself some vague pretensions, or which, at least, he had studied and reflected upon till it had become with him a kind of monomania. Mr Scott disavowed the possession of any gifts of that kind, evidently to the great disappointment of the inquirer, who then turned round and gave a signal to a huge black cat, hitherto unobserved, which immediately jumped up to a shelf, where it perched itself, and seemed to the excited senses of the visitors as if it had really been the familiar spirit of the mansion. "*He has poo'er*," said the dwarf, in a voice which made the flesh of the hearers thrill within them, and Mr Scott, in particular, looked as if he conceived himself to have actually got into the den of one of those magicians with whom his studies had rendered him familiar. "Ay, *he* has poo'er," repeated the recluse; and then, going to his usual seat, he sat for some minutes grinning horribly, as if enjoying the impression he had made; while not a word escaped from any of the party. Mr Ferguson at length plucked up his spirits, and called to David to open the door, as they must now be going. The dwarf slowly obeyed; and when they had got out, Mr Ferguson observed, that his friend was as pale as ashes, while his person was agitated in every limb. Under such striking circumstances was this extraordinary being first presented to the *real* magician, who was afterwards to give him such a deathless celebrity.

Although the care of his bees and the cultivation of his garden appeared, in the eyes of his humble neighbours, to be Davie's sole occupation, he had a private source of amusement within his solitary dwelling, to which they themselves were in a great measure strangers—namely, in books. Improbable as it may seem, this poor decrepit creature's favourite author was no other than the sentimental Shenstone, whose love-pastorals he confessed to afford him the most intense delight. Next to Shenstone in his favour was Milton's Paradise Lost, large portions of which he could repeat by rote; and his nice perception of the beauties of many of the sublimer passages is said to have been altogether extraordinary, considering his origin, education, and rank in life. In addition to these volumes, he had got a copy of "Tooke's Pantheon," and had his head confusedly stored with all the mysteries of the heathen mythology. Davie had likewise at his command the library of his kind benefactor, Dr Ferguson, who reckoned him a man of great capacity and originality of mind. He possessed, moreover, a keen relish for the beauties of nature, and would sit for hours gazing upon the varied landscape before him in a reverie of deep admiration; and in this lonely source of enjoyment it would almost seem as if Providence kindly intended a sort of compensation for that bar which excluded him from all participation in the social joys of humanity. His habitual and deeply rooted misanthropy, however, counteracted any beneficial effects which this affection for the pure aspect of nature might have had in mollifying down the asperities of his temper and disposition; and he awoke from these temporary reveries with a bitterer feeling of disgust with himself, and a more malignant feeling of hatred towards his fellow-creatures. The sense of his deformity haunted him like a phantom, and poisoned the very springs of his existence. This ever-present consciousness of his bodily inferiority frequently came upon him overpoweringly, even when in his mildest moods, and the workings of his agony are described to have been perfectly frightful. The same cause rendered him jealous in the extreme of every one that came near him, and he watched their every word and look for a mark of contempt towards himself. A lady who had known him from infancy, having gone one day to visit him in company with another lady, he took them through his garden, and was showing them, with much pride and good humour, all his tastefully-assorted borders, &c., when they happened to stop near a plot of cabbages which had been injured by caterpillars. Davie, observing one of the ladies smile, instantly assumed his savage scowling aspect, rushed among the cabbages, and dashed them to pieces with his stick, exclaiming, "I hate the worms, for they mock me!" Another lady, likewise an old acquaintance and generous friend, having called one day at his cottage, David, whilst ushering her into the garden, glanced back at her with one of his jealous looks, when, imagining that he saw her spit, he turned upon her fiercely, exclaiming, "Am I a toad, woman! that ye spit at me—that ye spit at me!" and drove her out of the garden with insult and imprecations. His expressions and threats when roused to anger were horribly savage, and altogether original. His dislike to children, which he acquired in youth, from their propensity to molest him, continued till the day of his death.

His cottage falling into disrepair about the year 1802, Sir James Nasmyth kindly ordered a new one to be erected for him and his sister, a poor helpless creature of imbecile mind, at a short distance from the site of his former abode. This cottage had two apartments; but although David consented to live under the same roof with his sister, he would neither permit her to come into his room, nor even to enter the house by the same door, and separate ones were accordingly made. The only living creatures, indeed, besides his bees, whose society Davie could tolerate, were the black cat above mentioned, and a dog, to both of which he was much attached. A large addition was also made to Davie's garden, all of which he trenched to the depth of two feet and a half with his own hands.

What withthe small pittance he and his sister received from the parish—they being for many years the only persons who got relief from the parochial funds—the produce of his bees and extra vegetables, and the numerous gratuities in money, food, and clothes, which he received from his neighbours and visitors (besides living rent free), David had even more than enough to satisfy all his little wants. A *meal-pock* always hung for him in the parish mill, and never failed to receive a multure from every grist. It must be mentioned, as a fact consistent with his misanthropic character, that although he scrupled not to accept of pecuniary donations, he never testified any particular gratitude to his benefactors for their bounty, or seemed to think himself at all under an obligation to them. He had a strange pleasure in wandering out in the dark, and is said to have spent whole nights amongst the ruins of old buildings, and other fancied haunts of spectres. Nevertheless, he was extremely superstitious, especially on the subject of witchcraft, to protect himself from which he had his garden well stocked with *rowan-trees*. He was supposed to entertain certain peculiar points of religious belief, but was frequently heard to speak of his existence in a future state with a fervour amounting to tears.

There was nothing very uncommon in the style of his dress when he went abroad, either to Peebles or any of the neighbouring farmers' or gentlemen's houses, which practice he altogether left off for many years before his death. He usually wore an old slouched hat out of doors, and a cowl or woollen night-cap at home. His feet, to fit which with shoes was beyond the ingenuity of any rustic artificer, were wrapt in pieces of leather or cloth. He always walked with a sort of pole or pike-staff considerably longer than himself.

David Ritchie died in December 1811, after an illness of three days, being reckoned at that time considerably above seventy years of age. About L.20 were found in his chest after his death, the half of which was restored to the parish. He had become penurious and miserly in his latter years; the only article on which he was ever known to expend any money being *snuff*, in which he indulged to excess. During his life, David had cherished and expressed a great desire to be buried in a romantic and beautiful spot on the Manor water, called Woodhill. His alleged reasons for this predilection were his antipathy to being huddled up in the kirkyard with the "*common brush*," as he expressed it, and his aversion to have "the clods clapped on him by such a fellow as Jock Somerville, the *bellman*," whom he mortally detested, on account, as some thought, of a resemblance which that obnoxious individual bore to himself in personal deformity. David changed his mind, however, on his deathbed, and he was "gathered to his fathers" in the churchyard of Manor.

Davie's sister, with whom he never could agree, survived him for many years. The poor creature, whose derangement increased much after her brother's death, continued to reside in the lonely cottage during the day, but was taken care of at night by some kind individuals in a neighbouring hamlet. The notoriety

which her moorland habitation acquired after the publication of the "Black Dwarf," caused her much annoyance by the questions put to her regarding her brother, by the idle and curious who flocked to the spot. "Will they no let the dead rest?" she would mutter to herself, after one of these interrogatory scenes; "what gars the fólk speir sae mony questions about us? Our parents were poor, but there was nae ill anent them." She was still further concerned when some one told her that her brother was introduced into a play; meaning that his fictitious representative was brought upon the stage in the drama formed out of the novel by Mr Terry. Her old acquaintance, Sir Adam Ferguson, paid her a visit soon after, and was saluted in the following terms:—"Oh, Maister Audam, isn't this an awfu' like thing? they say they're acting my brother Dauvit in Lunnon. Will they no let the dead rest in their graves?"—an appeal far from deficient in pathos. With that kindly and benevolent sympathy of heart which was one of his distinguishing qualities, Sir Walter Scott, in his introduction to the novel, in the late edition, expresses much concern at what the old woman suffered on account of his having made free with her brother. But he ought, at the same time, to have considered, that, if he thus occasioned her a little verbal persecution, the grievance was amply compensated by the pecuniary donations that were liberally showered on her by her interrogators, and which secured for her helpless old age many comforts which she might otherwise have wanted.

During the twenty years that have elapsed since the death of the hermit, his garden has been permitted to run almost entirely to waste; but we are fortunately enabled to present something like a catalogue of the numerous flowers and plants which it once contained, in the following lines, by Mr Thomas Gentle, gardener, Peebles, in which the writer has, with much ingenuity, and great simplicity of expression, put a whole *hortus siccus* into metre and rhyme:—

Old David reared the curious Christmas rose,
That in the month of January blows—
Batchelors' buttons—lilies, pure as gold—
Ground-ivy, twined in many a lengthening fold—
Myrrh—balm—thyme—and fair southernwood and mint,
Plants less desired for elegance than scent—
Blue violets—daisies—polyanthus red,
Under the leaves of deadly nightshade hid—
Tall shepherd's club—French William—blue monk's hood—
The modest primrose, native of the wood—
Green periwinkle, sage, and calomile,
That creeps along the surface of the soil—
Pennyroyal—millfile—Solomon's seal—
Fair flower-de-luce—French lilies—and speedwell—
Valerian—orpia—cransbile—scurvy-grass—
And tulips of the common kind and class—
Grey horehound—tansy—wormwood—bitter rue—
Wild agrimonia—and white feather too.
Famed star of Bethlehem, and Jacob's ladder,
With gardeners' garters, striped like any adder—
Carnation—poppies—catchflies—saxifrage—
And honesty, no favourite of this age—
Queen's jellyflower—campanula—fox-glove,
High stalks with white, and purple stalks above—
Red and white double roses—wallflower fine—
And many sorts of pretty columbine—
Walk-robin—hyssop—blue-glass—hellebore—
Coast Mary—beateny—and borage hoar—
St Johnswort—saving tree—and butcher's broom—
And yellow aconites, an early bloom—
Small dog-tooth violets—cowslips—golden rod—
Allicampane, with leaves more red and broad—
And a majestic Turkey-rhubarb bush—
Tall Scottish thistle—and the clothier's brush—
And small sweet-scented lily of the vale,
Mingling its sweetness with the passing gale.

BIOGRAPHIC SKETCHES.

DANIEL DE FOE,

The Author of "Robinson Crusoe."

"FEW things, in an ordinary life," says the *Edinburgh Review*, "can come up to the interest which every reader of sensibility must take in the author of Robinson Crusoe. 'Heaven lies about us in our infancy,' and it cannot be denied that the first perusal of that work makes part of the illusion. The roar of the waters is in our ears—we start at the print of the foot in the sand, and hear the parrot repeat the well-known sounds of 'Poor Robinson Crusoe! Who are you? Where do you come from, and where are you going?' till the tears gush, and, in recollection and feeling, we become children again! One cannot understand how the author of this world of abstraction should have had any thing to do with the ordinary cares and business of life; or it almost seems that he should have been fed, like Elijah, by the ravens. It is well, however, to be assured that he was a man of worth as well as genius; and that, having to contend all his life with vexations and disappointments, with vulgar clamour and the hand of power, yet he did nothing to leave a blot upon his name, or to make the world ashamed of the interest they must always feel in him."

DANIEL DE FOE was born in 1661, in the parish of St Giles, Cripplegate, in the city of London. His name was properly Foe, and he only added the *De* when grown up to manhood. His father was James Foe, a respectable butcher, of dissenting principles; and his grandfather, whose younger son his father is supposed to have been, was a yeoman of the same name, farming a small estate of his own at Elton, in Northamptonshire, and possessing the opposite principles of a cavalier and high-churchman.

By his father, the author of Robinson Crusoe was educated with the view of his becoming a dissenting clergyman: his chief preceptor was Mr Charles Moreton, who kept a dissenting academy at Newington Green, and subsequently emigrated to America. Whether from an unsettled disposition, or his father's inability to supply the necessary expenses, he never finished his education as a minister; but he nevertheless had acquired a knowledge at the academy of five different languages, of mathematics, natural philosophy, logic, geography, and history. His learning, however, is very plausibly supposed to have been superficial, and in which character it is spoken of by his contemporary, the poet Gay. The glory of De Foe was not destined, however, to arise from any modification of existing knowledge, but from the nervous common sense, and the power of describing imaginary beings under all the semblance of reality, with which he was endowed by nature.

The dissenting principles, which consisted in a denial of certain forms and powers assumed by the church of England, together with some dim but aspiring views respecting civil liberty, took such a fast hold of the mind of De Foe, that they never left him from the beginning to the end of his career. Entering into life at the end of the reign of Charles the Second, when both civil and religious tyranny were coming to a height, he could hardly fail, with such a mind and temperament as he possessed, to throw himself at once into the turmoil of polemical warfare. Accordingly, at the age of twenty-one, he wrote a satire upon the church clergy, styled "Speculum Crape-Gownorum." When only three years older, he took a more practical step against the church, by joining the rebellion of the Duke of Monmouth, which was very speedily put down. De Foe narrowly escaped being taken prisoner, and returning to London, eluded the wide-sweeping and bloody revenge with which the government visited the actors in that unfortunate movement. He soon after embarked in business as a sort of agent between the London hosiers and the country manufacturers, and, being free by birth, took up his living as a citizen of London. This happened in 1687-8, on the eve of the revolution, a crisis when neither stockings nor citizenship could keep De Foe from pen and ink; and accordingly he joined the numerous assailants of the tottering power of King James. Of the revolution, he was not only a supporter—he hailed it with enthusiastic joy, and ever after observed the 4th of November, the anniversary of the landing of the Prince of Orange, as a holiday. In October 1689, when King William and Queen Mary paid their first ceremonial visit to Guildhall, Daniel De Foe appeared conspicuously in the procession as one of a royal regiment of volunteer horse, made up of the chief citizens (chiefly dissenters), and who, gallantly mounted and richly accoutred, made a very great show. He admired the character of King William to a degree of enthusiasm, and, unlike the generality of the English people, retained a warmly grateful sense of his services to British liberty and freedom of conscience. As an exposure of the absurd cry that the king was a foreigner, De Foe wrote his poetical satire, entitled, "The True-born Englishman," a piece which, though deficient in polish, is a masterpiece of good sense and just reflection, and shows a thorough knowledge both of English history and of the English character. It is, indeed, a complete and unanswerable exposure of the pretence set up by the English to a purer and loftier origin than all the rest of the world, instead of their being a mixed race from all parts of Europe, settling down into one common name and people. King William was so much gratified by this publication as to extend his personal friendship to the author, who was often closeted with him during the latter part of his Majesty's life. His pen, however, added more to his celebrity than his fortunes. Having engaged in the Portuguese and Spanish trade, he lost a vessel by shipwreck, and, from one cause or other, miscarried in business of two or three descriptions. Like most falling men, he committed some errors in attempting to retrieve his affairs. They could not, however, have been very unpardonable, as he was not made bankrupt, and his creditors agreed to take his own personal security for the composition. What is still more to his credit, after being fully discharged he continued to pay to the extent of his power, to the amount of some thousand pounds. The fact is equally characteristic, that, while in this state of depression, he occupied himself in projecting ways and means for the government, which obtained him a small place and other countenance, and restored him to comparative competence.

The death of King William in 1701 made matters much for the worse with De Foe. Under Queen Anne, the high church system waxed more and more furious and intolerant, till, in the end, a university preacher was able, with impunity, to lead an infatuated mob through the streets of London, pulling down the dissenters' places of worship, burning their private dwellings, and making it unsafe for one of that profession to be seen abroad. The established clergy, in general, cherished the most embittered feelings towards the dissenters, and desired to see them subjected to very severe penalties. De Foe marked, with an exact eye, the extravagant notions which the heat of the time had engendered in the minds of these men, and, under the title of "The Shortest Way with the Dissenters," brought out a pamphlet, in which he caricatured the whole under a semblance of the most serious earnest—insomuch that, at first, the pamphlet was highly extolled by the clergy as a more than usually uncompromising demonstration of their favourite views respecting the people.

When it was at length discovered that the author was only burlesquing the sentiments of the clergy, he was immediately denounced as one of the most profligate of men; nor were even his own brethren, the dissenters, so sure of the propriety or expediency of his satire as to stand up in his defence. A prosecution for seditious libel, in which the accusers hypocritically overlooked the real, as opposed to the apparent tendency of the pamphlet, was instituted against him. He was moreover cheated into a plea of guilty, by the expectation of a pardon, when, to the eternal disgrace of justice, a sentence followed, inflicting a triple appearance in the pillory, a fine of two hundred merks, imprisonment during the queen's pleasure, and sureties for good behaviour for seven years. The firmness of character of this extraordinary man was strikingly exemplified by the fortitude with which he endured the ignominy of the first part of his sentence, and the total ruin of his affairs (and at the time he possessed a wife and six children), which followed a prosecution so merciless. Instead of yielding to despondency, his elastic mind fell back upon its resources, and, besides the immediate production of his caustic satire, termed "A Hymn to the Pillory," during his imprisonment, which lasted nearly two years, he commenced his celebrated journal, "The Review;" published a collection of his works; kept up a pamphleteering warfare on various public topics with all his usual activity; and in no respect showed any mental yielding to his fallen fortunes. Pope, in his Dunciad, has made an ungenerous allusion to the circumstances:

"See where on high stands unabashed De Foe."

But without any wish to depreciate the merit of this poet, it may be said that De Foe had ten thousand times more real glory in enduring the honourable dishonour of the pillory for an effort in behalf of humanity and toleration, than what the author of the Rape of the Lock had in any single transaction of his crazy and capricious life.

It is a remarkable fact that De Foe was condemned for patriotic conduct under a Whig ministry, and that he was released and consoled by a Tory one. On the accession of Harley and Bolingbroke to power, the former interceded for and obtained his liberation, and prevailed upon the queen to supply the money for his fine and expenses. This can scarcely be called a disinterested proceeding, as the object evidently was to buy off a writer of whom the new cabinet had some reason to stand in dread. De Foe accepted from Harley the charge of acting as a confidential agent, at Edinburgh, in the transactions of the Union between Scotland and England—a duty which he is allowed to have discharged with activity and zeal, and chronicled in his "History of the Union" with much ability. It does not appear that he either employed his pen, or gave his personal services, in behalf of any of the expressly Tory measures of this celebrated cabinet; he only abstained from writing against it, which was the least that his obligations to Harley would allow him to do. He had, besides, another and equally cogent reason for doing little at this time in behalf of the popular cause. The popular cause was hardly true to itself. The mass of the community were led away by the insane cry of "the church is in danger," from the pursuit of their own proper objects, into a defence of others with which they had nothing to do. De Foe, whose mind went always in the van of the age, suffered more from the party which he led than from that which he opposed; so that it could hardly be wondered at if he at last drew off from active combat, and contented himself with merely cherishing in his own bosom those abstract principles which he considered his fellows not yet fitted to realize. Having published a pamphlet, in which he ironically urged the people to bring in the Pretender by a caricatured use of all the Jacobite arguments, he was prosecuted for it by a co-patriot, named William Benson, who, being utterly unable to see the real drift of the *jeu d'esprit*, conceived that the author was in league with the disinherited Stuart, and endeavoured to bring him to trial accordingly for high treason. It was only through the friendly zeal of the Tory Harley, and his representations to Queen Anne, that De Foe was released from Newgate, whither he had been committed on the judges' warrant for writing something in defence of his pamphlet, after its presentation to the grand jury, and his being compelled to give bail to appear for trial. Such was the perseverance of his enemies on this occasion, that his ministerial friends thought it most advisable to cover him by a formal royal pardon, to which event he has alluded with considerable humour.

De Foe's defence of a proposed commercial treaty with France, on grounds which exhibit the clearness of his ideas on that subject to great advantage, brought on a still greater torrent of enmity and abuse; until at length the accession of George the First, which he had strenuously supported, by depriving him of every species of protection, drove him from politics altogether. His spirit seemed at last to give way to so much unrelenting enmity, and a slight fit of apoplexy ensued—an event which rendered an appeal which he soon after published, in defence of

his conduct and writings, more particularly impressive.

At the verge of three score, struck with one fit of apoplexy, and tormented with the gout and stone, this persecuted, but most virtuous and ingenious man, retired to Stoke Newington, and turned to an employment which might rather have been expected to engage him in the bloom and verdure of life—namely, the writing of romances. His Robinson Crusoe, which was among the first, appeared in 1719, and immediately obtained that degree of public favour which it has ever since maintained. The original idea was communicated to him by a Scottish mariner, named Alexander Selkrig, who had accompanied Captain Woodes Roger upon his voyage round the world, and been left for three or four years upon the uninhabited island of Juan Fernandez in the Pacific Ocean. It has a merit which does not belong to any of the other romances of De Foe; for while these in general refer to the very lowest and most profligate characters in social life—such as pickpockets, sharpers, and women of various degrees and kinds of infamy—and are, therefore, of very questionable moral tendency, this legend of the lone and melancholy sea is a complete abstraction from all polluting scenes, depending for its interest solely upon the sympathy which we feel for a human being placed in such an extraordinary situation, and the ingeniously minute and well conceived train of circumstances and adventures which the author has imagined for his hero. "The great beauty of this fiction," says a recent Reviewer, "consists, not in the hero, but his situation, and the admirable manner in which he is made to adapt himself to it. Human sympathy attends his every action, and the simple and natural pathos of a plain unsophisticated man on the sublimity and awfulness of perfect solitude, moves more than would all the feeling and eloquence of Rousseau, had he attempted a similar story. No wonder this tale is translated into all the European languages, and even into Arabic, as we are informed by Burckhardt, although that people possess a Crusoe, in 'Hai Ebn Yokdan,' of their own." It will be in vain, this critic thinks, to contend for the same merit in Moll Flanders, Captain Singleton, Colonel Jack, and other romances produced by De Foe—yet they show, equally with Crusoe, that first-rate sign of genius, the power of imagining a character within a certain range of existence, and throwing into it the breath of life and individualization, which was a pre-eminent mental characteristic of De Foe. This was also shown in various works of fiction, which he produced as veritable histories and biographies, such as the Citizen's Account of the Great Plague of London in 1665, the Memoirs of Captain Carleton, and others. The most acute readers have been deceived by the amazing appearance of natural probability borne by these works. Even in his lowest romances there are touches here and there which charm us by their exquisite simplicity and truth—as, in "Colonel Jack," where the boy hero and his companions are sitting at a three-half-penny ordinary, and are delighted, even more than with their savoury fare, to hear the waiter cry, "Coming, gentlemen, coming;" when they cry for a cup of small beer; and also where we are told, as a notable event, that "about this time the Colonel took upon him to wear a shirt."

Notwithstanding the number and success of his publications, De Foe, we lament to add, had to struggle with pecuniary difficulties, heightened by domestic afflictions. To the last, when on the brink of death, he was on the verge of a jail; and the ingratitude and ill-behaviour of his son in embezzling some property which De Foe had made over for the benefit of his sisters and mother, completed his distress. He was supported in these painful circumstances by the assistance and advice of Mr Baker, the celebrated naturalist, who had married his youngest daughter, Sophia. The subjoined letter gives a melancholy but very striking picture of the state of his feelings at this sad juncture:—

"Dear Mr Baker,

"I have your very kind and affecc'onate letter of the 1st: But not come to my hand till the 10th; where it had been delay'd I kno' not. As your kind manner, and kinder Thought, from which it flows (for I take all you say to be as I always believed you to be, sincere and Nathaniel like, without Guile), was a particular satisfacc'on to me; so the stop of a Letter, however it happened, deprived me of that cordial too many days, considering how much I stood in need of it, to support a mind sinking under the weight of an afflicc'on too heavy for my strength, and looking on myself as abandoned of every Comfort, every Friend, and every Relative, except such only as are able to give me no assistance.

"I was sorry you should say at the beginning of your Letter, you were debarred seeing me. Depend upon my sincerity for this, I am far from debarring you. On the contrary, it would be a greater comfort to me than any I now enjoy, that I could have your agreeable visits with safety, and could see both you and my dearest Sophia, could it be without giving her the grief of seeing her father *in tenebris*, and under the load of insupportable sorrows. I am sorry I must open my griefs so far as to tell her, it is not the blow I received from a wicked, perjur'd, and contemptible enemy, that has broken in upon my spirit, which as she well knows, has carryed me on thro' greater disasters than these. But it has been the injustice, unkindness, and, I must say, inhuman dealing of my own son, which has both ruined my family, and, in a word, has broken my heart; and as I am at this time under a weight of very heavy illness, which I think will be a fever, I take this occasion to vent my grief in the breasts who I know will make a prudent use of it, and tell you, that nothing but this has conquered, or could conquer me. *Et tu! Brute!* I depended upon him, I trusted him, I gave up my two dear unprovided children into his hands; but he has no compassion, and suffers them and their poor dying mother to beg their bread at his door, and to crave, as if it were an alms, what he is bound under hand and seal, besides the most sacred promises, to supply them with; himself, at the same time, living in a profusion of plenty. It is too much for me. Excuse my infirmity, I can say no more; my heart is too full. I only ask one thing of you as a dying request. Stand by them when I am gone, and let them not be wrong'd, while he is able to do them right. Stand by them as a brother; and if you have any thing within you owing to my memory, who have bestow'd on you the best gift I had to give, let them not be injured and trampled on by false pretences, and unnatural reflections. I hope they will want no help but that of comfort and council; but that they will indeed want, being too easie to be manag'd by words and promises.

* * * *

"It adds to my grief that I must never see the pledge of your mutual love, my little grandson. Give him my blessing, and may he be to you both your joy in youth, and your comfort in age, and never add a sigh to your sorrow. But, alas! that is not to be expected. Kiss my dear Sophy once more for me; and if I must see her no more, tell her this is from a father that loved her above all his comforts, to his last breath.

"Your unhappy, D. F.

"About two miles from Greenwich, Kent,
"*Tuesday, August* 12, 1730."

From this scene of sorrow we must now hasten to an event that dropped before it the dark curtain of time. Having received a wound that was incurable, there is too much reason to fear that the anguish arising from it sunk deep in his spirits, and hastened the crisis that, in a few months, brought his troubles to a final close. The time of his death has been variously stated; but it took place upon the 24th of April 1731, when he was about seventy years of age. Cibber and others state that he died at his house at Islington, but this is incorrect. The parish of St Giles, Cripplegate, in which he drew his first breath, was also destined to receive his last. This we learn from the parish register, which has been searched for the purpose, and farther informs us that he went off in a lethargy. He was buried from thence, upon the 26th of April, in Tindall's Burying-ground, now best known by the name of Bunhill-Fields. The entry in the register, written probably by some ignorant person, who made a strange blunder of his name, is as follows: "1731. April 26. Mr Dubow. Cripplegate." His wife did not long survive him.

THE DEAD-LETTER BOX.

When residing on the coast of Malabar, in the year 1820, I had occasion to be much with Captain Graham, who was at that time adjutant of one of the king's regiments stationed in India. The head-quarters were in a small island connected with the mainland by a ledge of rocks, which were dry at low water, so as to allow the passage of people on foot, or in palankeens; and the house which Captain Graham occupied lay at the farthest point of the island, between two small clumps of cocoa-nut trees. The situation was uncommonly pleasant, being open on all sides to the breeze from the sea, and enjoying from its verandah a broken view of the surrounding bay, which appeared in glimpses through openings among the palm trees. The little Arab prows, flitting up and down on the water like butterflies, or gliding from island to island, with their white bleached sails and turbaned seamen, were often seen and lost as they passed these openings, and gave an appearance of romance to the scene which rendered its quietness doubly agreeable.

On calling on Captain Graham one morning, I found him seated in his verandah, busied among a chaos of regimental papers, report books, accounts of stores, and other matters, which, with the assistance of a Purvo, or Hindoo clerk, he was arranging and putting up in separate bundles. After the usual compliments, he pushed aside some of the litter of papers which had gathered on the sofa, and gave me a seat beside him. "The regiment has shifted its quarters frequently of late," he said, "and our depot of records has not missed its share of the jolting of long marches, so that it has got into sad confusion. The colonel has sent this morning for some papers, for which I had to turn over the whole archives of office. We have now found almost the whole of them, so that I will be able to join you in a few minutes. I received some English papers this morning, which Hybutty will bring for you." The clerk, a tall graceful-looking man, with a white muslin frock fastened round the waist, and a red turban (the dress of his caste), went, with a look of great submission, and brought the papers; but I had seen them before, so that I began to look about me for some other amusement; and observing a drawer lying at my foot, marked the "*Dead-Letter Box*," I began to turn over its contents. They consisted chiefly of letters from England to men belonging to the regiment who had died in India, and were many of them of a very uninteresting character. Numbers had their directions so ill written, that it was surprising how they had ever found their way to India, or, being there, how the Hindoo clerks of the post-office had contrived to discover their owners. Several of them (from this cause, I supposed) were marked, *mis-sent to China*, or other places. Some were unsealed, torn, and crumpled; others were lying sealed, as they had arrived from England. I glanced into some of the former, chiefly to soldiers from their relations at home, and was struck with the melancholy contrast between the reality and the hopes of the writers, who always seemed to consider their friends as alive and well, whereas they had often been dead before their letter was written, and always before it arrived in India.

There was one packet, consisting of three or four letters, tied up together with a piece of twine, and all addressed to the same person. The hand-writing of these was greatly superior to that of most of the others; and I was reading the address half aloud—"Lieutenant George Moxley"—when Captain Graham turned round, with a gesture of inquiry. "I have been looking at the letters in this box," I said, "and this one I think is addressed to 'Lieutenant George Moxley.'"

Captain Graham appeared a good deal interested, and said, "Poor fellow! he is dead several years ago. His death had something affecting in it, and made a greater impression on me, as he came from the same neighbourhood with myself. He was extremely anxious to do well here, hoping to be able to assist some friends who were not in the best circumstances at home."

"This is a letter from his sister, I believe," said I.

"We may read it," said Captain Graham; "the whole melancholy story is over now."

I took the letter accordingly: it was written in a beautifully delicate female hand, and signed "Anne Moxley." I read it aloud.

"My dear George—Your last letter gave us all great pleasure. Papa received it while we were at breakfast, and read it quite through to himself before he told us any thing of the contents. But I saw at the first by his looks that it was agreeable to him; and when he read aloud your affectionate recollections of us all, you may be sure that we shared in his pleasure. We had been very anxious about you for some time, particularly as we learned from Captain Bingham's letter that your company had been ordered to a station which is reckoned unhealthy. I think I never saw papa so much pleased, as when he found that you were well, and in good spirits. Robert was quite elevated with the account of your travels and adventures, and says he will go to India too. But mamma looked grave and unhappy at his talking; and I think, notwithstanding that you are so much pleased with your condition and prospects, she still regrets that you had not remained in some situation, even of less promise, at home. My dear George, how much both she and my father think of you, and how much—how very much—of their happiness depends on your being well! The effects of your letter upon the whole of us remind me of nothing so much as a fine sunny day in spring upon the birds in the garden. We were all happier; and I could have fluttered about among the bushes, and sung songs myself. Little Alice, who was so little when you left us, is grown a tall girl now, and plays and sings beautifully. You recollect how you used to scold me for mangling your favourite '*Tuttitaiti.*' I am sure you would be delighted if you heard her play it. She took more pains with it than any other, after she heard that I used to tease you by neglecting it.

"Robert is at Mr Griffith's academy, and papa gets good accounts of his progress. He makes very pretty drawings in pencil; they are really good. I was going to send you his sketch of the wooden bridge which joins the two willow trees leaning across the water, but he has scratched all the back with mathematical triangles, and spoiled it. But I will have him to make another for you, and will send it the first time a parcel can be forwarded.

"I think papa is not so cheerful as he was wont to be; it may be only my fancy; but I often see him pacing about in the garden, and looking anxious; and I am sure some letters which he received lately made him uneasy. Mamma looked very earnestly while he was reading one of them; but when she saw that it attracted my attention, she spoke of some indifferent matters, and neither papa nor she said any thing afterwards about the letters to us.

"I had arranged to go a little jaunt this summer with Grace Fairley to her relations, near Wigan; but the anxiety which I see in papa throws a kind of damp on my spirits, and I don't think I can go, though it will disappoint Grace. I would like much better to stay a week or two with the Fairleys themselves—they are so quiet and agreeable; and, with Grace's liveliness, it would remind me of the time when you used to go with me, and we were all so happy together. I believe Grace thinks of those days as well as I—a visit, when you and I used to go by ourselves, put

her in better spirits than I ever see her in now, with all their company.

"Aunt Haxton is——"

"The rest of Miss Moxley's letter is about relations," I said; "we need not read it; but here is one from her father."

"Read that," said Captain Graham.

"It is not long," I replied, and began to read.

"My dear George—Your sister's letter will tell you how much we were gratified to hear that you were well, and in good spirits. There is nothing which can cheer our homely fire-side so much as to know that you are pleased with your prospects, and have been able to recommend yourself to the attention of gentlemen who can be of use to you. The patronage of Colonel Bruce does you much honour; and I was glad to see the manner in which he spoke of you in a letter to his brother, with whom I had some acquaintance many years ago. Your night expedition, to make a survey of the fort of Kaladroog, seems to have recommended you strongly to his attention; but though I told your mother that he had noticed you, I remained (as you have done) silent as to the adventure itself, which was not of a nature to amuse mothers. I hope his friendship will be of advantage to you; and in India, as I dare say you have seen by this time, nothing assists the prospects of young men, even of the steadiest habits, so much as the countenance and protection of gentlemen of his character.

"You are already aware of the disappointment we met with in your uncle's business; his affairs are not yet wound up, so that we are not informed of the total loss, though I am afraid it will be considerable. I have not, of course, been able to conceal it from your mother, whose distress, both on her brother's account and our own embarrassment, affects her spirits a good deal. It was lucky that your letter arrived at the time it did, as it has served to restore her, in some measure, to her wonted composure and cheerfulness, though I am quite sure that you must have made a great sacrifice in sending the very considerable remittance which it inclosed. I applied it, as you requested, to the expenses of Robert's education, who, I am glad to say, makes very fair progress. In mathematics, he is quite beyond the lads of his age.

"As your sister will write you a long letter, I shall add little more. I hope that you may continue prosperous, and, above all, that you be such, both towards God and man, as to merit prosperity.—I am your affectionate father, SAMUEL MOXLEY."

"The remaining letter," I observed, "is signed *Robert Fairley*,"

"Poor Moxley's school-acquaintance and intimate friend," replied Captain Graham; "we were all three educated together, but Fairley had no occasion to come to India."

I proceeded to read the letter, which was in a different strain from the others.

"My dear Moxley—I suppose this letter will reach you at the foot of some Indian rock, with a castle on its shoulder, which you are going to take by surprise from its black tenants. What a strange lad you are! Who would have thought that the quiet George Moxley, who was known here for nothing but his skill in useless languages, should undertake such adventures? I heard Mr Bruce read the letter which he received from his brother, concerning your night expedition in the disguise of a Jagee, to take a survey of the fort of Kaladroog, and was quite surprised at your clever management; it is very lucky that Jagees are not required to speak to every one that asks questions, else you might have been puzzled a little. But is it possible that you were dyed black? What a figure you must have made!—naked, with a rope about your waist, and a wig powdered with ashes! If masquerades were in fashion, you would have drawn some attention here in that costume. And then your return next night with a party of soldiers to scale the rock, and take the Indians and their black prince in their beds. I can't pardon you for being so cunning, George: you should have appeared in the morning before the gates of their castle with your band of heroes, and blown your horn, like a good knight and true, to invite the sable warriors to equal combat, or to deliver up their enchanted fortress. I believe, however, this was not Colonel Bruce's opinion. He gives you great credit for the saving of time you caused him at the beginning of the rains.* Pretty soldiers you, to be afraid of a shower! I have always heard that our Indian army was tender of its health, and here is a proof of it. However, as Colonel Bruce was pleased, and every body else seems satisfied, I suppose I must allow you some credit too.

"But to have done with this: Our old friend Mrs Griffiths is dead, and has left, as was expected, the greater part of her property to Grace. It is very considerable indeed; and I am glad of it, for your sake as well as hers. I can see that Grace has nearly the same thoughts herself. And I can assure you, that my mother and the whole of us retain our high esteem for you, and will be glad if your expected furlough can be procured. Mr Bruce knows of the arrangements for your marriage, and will use his interest with his brother both for your sake and ours.

"I was at Glenskeach during the shooting season, and had excellent sport—though not to be compared with tiger hunting, I suppose. However that may be, I hope you will be able to make the experiment with us next year, and, by so doing, add to the pleasure of more than one old friend.—I am, &c.

"ROBERT FAIRLEY."

After reading the letters, I held them in my hand for a few moments with a feeling of regret and sorrow: "And the object of all these regards—this affectionate son—this kind brother—this favoured lover and friend—died shortly after?"

"He was dead while these letters were in writing," replied Captain Graham, looking at the date of one of them. "After the enterprise which he carried through so gallantly at Kaladroog, he rose rapidly in the good opinion of all the superior officers; and it was arranged that he should receive the appointment of aid-de-camp to the governor. In the meantime, however, he was ordered with a detachment upon a separate service, near Barodah: his party had to march for several days along the banks of the Nerbuddah, one of the most unhealthy aguish tracts in India—hot and stifling in the day-time, and after nightfall, damp and chilling in the extreme. Moxley, however, knew the precautions necessary in such a climate, and had sense enough to attend to them; but after several fatiguing marches, the encampment was discovered one night to be on fire, and alarm immediately spread that it was caused by the enemy. Mr Moxley's activity and previous arrangements prevented any serious damage, and the enemy (if it was their work) found no opportunity of profiting by the confusion. The fatigue, however, and exposure, threw him during next day's march into a brain fever, and he was carried in that state to Baroach. He lay for several weeks in a state of madness, accompanied by symptoms which every day threatened his life. After recovering a little, he was brought to Bombay for change of air and medical attendance: I was at Goa at that time, and when I arrived at the presidency, he was much recovered, being able to see his friends, and to speak a little, though still incoherently, at times. I was too much occupied to see him for some days, but he at last sent for me, and I was to call at his tent on the esplanade next morning. I went accordingly, and on alighting from my palankeen, was astonished to find no servant in attendance but a little Hindoo boy, while every thing about the tent seemed to be in confusion! 'Where is your master, Sunder?' I said. 'Oh, sahib,' cried the lad in a scream between terror and grief, 'Moxley sahib bhaug-gya.'—'Bbaug-gya! you little fool,' I replied, 'Mr Moxley run away! what do you mean?' The poor boy could do nothing but reiterate his assertion that his master had run away; and as I saw that there was no more to be learned from him, I was leaving the place, when one of my palankeen bearers, who had met an acquaintance at a neighbouring tent, came up and informed me that my friend had actually disappeared that morning, no one could tell how. His servants, on entering his apartment, found his bed deserted, and a quantity of clothes thrown in confusion about the floor; a book which he had been reading the night before, was gone, but his watch was in its usual place, and every thing else undisturbed. I hurried immediately to Dr Lamb, the medical gentleman who had been attending Mr Moxley, and found there his Parsee servant, and one or two of his friends, on the same errand with myself. Dr Lamb was not at home; but, from circumstances mentioned by the Parsee, we were led to conjecture that some relapse of mania had affected Mr Moxley, and that he had escaped from his tent in that state. But where to seek for him? We hurried away in different directions; and, after spending an anxious day, galloping about among the villages and cross roads, I learned at last that some country people had seen a European gentleman, unattended and in disordered dress, that morning on the road to Mahim. I hurried immediately in that direction, thinking that he might have gone to Tanrah, a military station in the island of Salsette. I could not, however, arrive there before midnight; but, just as I had passed the causeway which joins the islands of Bombay and Salsette, I met a native, who told me that a white man had been seen that afternoon going up an opening in the jungle (wild thickets), and he was afraid he would fall a victim to the tigers. I shuddered at the idea, but knew not what to do, as it was now far in the night, and I had with me only one servant, besides being very slightly provided with arms. On inquiry, I found, that, by following a certain track, I should arrive at an Indian village, where assistance of some kind might be procured. The road was one of the most dismal I ever travelled, for it was at this time the season of the rains; and after dark, it came a storm of thunder and lightning, accompanied with such a deluge from the clouds as almost blinded us. I knew no step of the way; and though the road was illuminated at times by gleams of lightning, which showed us a kind of open track through the rocks and brushwood, still we were so much dazzled by the flashes, that the darkness after each appeared tenfold thicker, and more bewildering. I never was more perplexed, and, considering that the life of my poor friend depended on the expedition I should make, I can hardly express my feelings. After travelling in this way for more than two hours, and losing our road more than once among the trees, a sudden and vivid flash of lightning threw a glare upon every thing about us, and I saw in the momentary light that we had just passed to one side of a row of cottages, and were leaving them. On calling at one of the huts, we found a boy asleep in the corner of a kind of verandah attached to it; we wakened him, and found that the people of the place were Indian-Portuguese, and that we had luckily stumbled upon the house of their Padré, or priest. The boy got a light, and the Padré soon made his appearance; he was a venerable old man, perfectly black, with hair as white as wool. I had some difficulty in explaining to him our object, from my ignorance of Portuguese and Mahrattee, his native languages; and, what you will think strange in an Indian village, I was obliged sometimes to have recourse to Latin, as a tongue which we could use in common. When he comprehended my situation, the old man expressed the greatest sympathy, and said that some of his people would go with us in the morning. 'But can nothing be done now?' I said. 'It is impossible,' replied he; 'the jungle is infested by tigers; and the darkness, besides, is such, that the people could not keep together, even if they knew where to go, or if your poor friend could answer their signals.' I felt that his reasoning was unanswerable, and was obliged to acquiesce. He sent for one or two of his people, to whom he gave directions to be ready early in the morning; and some of them, in the meantime, kindled a fire to dry our wet clothes.

"You may easily imagine the anxiety and impatience with which I waited for morning. As soon as light appeared, the people were dispatched in different directions along the track which we supposed Mr Moxley had taken. The village lay in a small hollow of the woods, from which the surrounding hills were seen at a distance rising in abrupt and barren shelves; the jungle or woodland only running up the slanting ravines in their sides, where there was some depth of soil. The path which Mr Moxley was supposed to have taken led along one of these, and we searched it in every quarter, but in vain. The day was calm, and excessively hot, as is not unfrequent after rain, so that I began to be exhausted and feverish, while anxiety agitated me to a degree I can hardly express. We had yet seen nothing giving the smallest clue to success; and as the natives have a kind of instinctive dread of approaching the beds of gigantic reeds, which are supposed to be the couching places of the tiger, there were many spots which I could not get examined. I was beginning utterly to despair, when one of the people called out, 'A tiger—a tiger!' and he and his comrades made a rush towards some precipitous rocks, which we had been skirting for the last quarter of an hour. I went after them in the same direction; but as I knew they were easily alarmed, and believed that it might be only some chance rustling of the long hard grass which they had heard, I stopped at intervals, being ready to fire in case of any real danger. While I was waiting in this manner, I heard one of the villagers call me in a hurried voice, 'Sahib, sahib, hidhur ao!' (Sir, sir, come here!) On following him round the thicket, I saw two of the people standing before a kind of low opening in the face of the rock, to which the man led me. The place within could hardly be called a cavern, as the day-light glimmered back to its farthest extremity, and I could see a white object lying or sitting on the floor within. Conjecturing (as the men had done) that this must be my friend or his lifeless remains, I rushed into the place, and, to my astonishment, saw Mr Moxley sitting on a ledge of the rock with a book on his knee, apparently reading with perfect composure. When I came quite near, he lifted up his head, and, after looking at me for a moment, said, with a kind of feeble smile, 'Ah, Graham, you are here at last! Why did you not come when I sent for you yesterday?' The strange wandering expression which accompanied these words, showed me too truly the state of his mind; and his pallid ghastly features indicated a weakness, of which he himself seemed totally unconscious.

"I was delayed at the adjutant-general's office," I said; "but I hope you have not been worse?"

"They promised me a furlough, and I dreamed last night that we had set sail; is that true?"

"Only a dream," I said.

"Ah, Graham," he said, again looking up, "what brought you and Miss Fairley to this strange place? The camp was on fire again last night."

"I had by this time put my arm round his shoulder, and he leant on me without an effort to support himself. I sent one of the men in the meantime to the village to procure some means of conveyance from the woods; and while he was gone, I endeavoured to get our patient, who had had no nourishment for two days, to take a little milk and rice bread, which we had brought (the only food to be procured in the village). He looked at it a little, without seeming to comprehend what we wished, and then, with great difficulty, swallowed a few drops of the milk. He seemed to revive a little, and said,

"I should wish to see my father."

"I could not make any answer; and, after a few moments, he continued—

"I am dying, Graham; what will become of them all?"

"He appeared a little collected while he said these words; but raising himself up, as if looking earnestly

* The rains in India are so heavy and continued when they set in, that no military operations can be carried on afterwards for four months, and an army which attempts to keep the field rarely escapes destruction.

at one of the men coming in from the mouth of the cavern, he said,

"Anne, Anne! I thought Grace Fairley would have come with you."

"In a few minutes he sunk back on the shelving rock; and though he lived for some time, he did not again speak. I carried the remains of my poor friend to the village, on one of the rude couches used by these people, made of four poles laced together with coir ropes; and he was buried next day near the Portuguese village in that wild district."

LITERARY HISTORY OF THE BIBLE.

THE SEPTUAGINT AND VULGATE.

It has generally been admitted, that the SEPTUAGINT, which, as has been explained, is so called from the number SEVENTY, or, more properly, SEVENTY-TWO interpreters, who were said to be employed in the formation of it, was the first Greek version of the Old Testament. No mention has been made of any that preceded it, and it cannot be deemed probable that Ptolemy would have taken so much pains to procure a version of the Jewish law, had any other previously existed: and it is equally improbable he should have been unacquainted with it, had it existed at a time when, with the assistance of Demetrius, he was procuring Greek books from every part of the world. It is plainly affirmed by Philo, that before his time the law was not known in any language but the original. The acquaintance with Jewish customs and Jewish history, which many Heathen writers, before the reign of Ptolemy, have manifested, has led many persons to conclude that they must have derived their knowledge from a Greek version of at least parts of the Old Testament. Yet we may account for the knowledge of Jewish customs, &c. which these writers display, without supposing that they obtained it from any Greek version; for we have direct evidence that Aristotle, at least, had intercourse with the Jews, for the purpose of gaining information respecting their law; and as the philosophers were certainly acquainted with the doctrine of the Gymnosophists and of the Druids, who had not any written law, so we may suppose they obtained their knowledge of the Jewish religion from personal intercourse with individuals of that nation.

At first, it is probable, the Law only was translated, for there was no need of the other books in the public worship; no other part of the Scriptures but the Law having been in early times read in the synagogues. But afterwards, when the reading of the Prophets also came into use in the synagogues of Judea, in the time of the persecution under Antiochus Epiphanes, and the Jews of Alexandria, who in those times conformed themselves to the usages of Judea and Jerusalem in all matters of religion, were induced hereby to do the same; this caused a translation of the Prophets also to be there made into the Greek language, in like manner as the Law had been before. After this, other persons translated the rest for the private use of the same people; and so that whole version was completed which we now call the Septuagint; and after it was thus made, it became of common use among all the churches of the Hellenistical Jews, wherever they were dispersed among the Grecian cities.

When the Hebrew language had ceased to be the vulgar tongue, the version of the SEVENTY was read in the synagogues, even in Judea itself. It is true, this was not universally done; there was a sort of division among the Jews about it; some were for having the Scripture read only in *Hebrew*, and were, therefore, called *Hebrews* or *Hebraizers;* whilst others read it in *Greek*, and were called *Hellenists*, that is, *Grecians* or *Grecizers*, as has been already observed. As the number of the latter was greater than that of the *Hebrew-Jews*, and the Apostles preached most frequently to them, it is not to be wondered at, as St Jerome observes, that the passages of the Old Testament which are quoted in the New, are sometimes borrowed from thence. It is thus seen that this version preceded the publication of the Gospel; and it has been authorised by the use which the Apostles made of it, as well as the whole church. It seems very evident, however, from various passages, as Parkhurst has remarked, that the writers of the New Testament, in their citations of the Old, did not intend either literally to translate the Hebrew, or to stamp their authority on the SEVENTY translation, but only to *refer us to the Original Scriptures.*

The Septuagint version was continued in public use among the Jews for more than three hundred years; but as it grew into use among the Christians, it went out of credit with the Jews. In the twelfth year of the Emperor Adrian, A.D. 128, Aquila, a native of Sinope, a city of Pontus, published a new Greek version of the Old Testament. This man, who had been a Christian, and afterwards became a Jew, is supposed to have undertaken this work in opposition to the Christians, not only that the SEVENTY might be superseded, but that a new version might be given of those passages on which they relied most in their controversies with the Jews. The Hellenistic Jews received this version, and afterwards used it every where instead of the Septuagint; and, therefore, this Greek translation is often made mention of in the Talmud, or Compendium of Jewish Doctrines, but the Septuagint never. The Emperor Justinian published a decree, which is still extant among his institutions, whereby he ordained, that the Jews might read the Scriptures in their synagogues, either in the Greek version of the SEVENTY, or in that of Aquila, or in any other language, according to the country in which they should dwell. But the Jewish doctors having determined against this, their decrees prevailed against that of the emperor, and, within a little while after, both the Septuagint and the version of Aquila was rejected by them; and ever since, the solemn reading of the Scriptures among them, in their public assemblies, has been in the Hebrew and Chaldee languages. "The Chaldee," says Prideaux, "is used in some of their synagogues even to this day, and particularly at Frankfort, in Germany."

Not long after the time of Aquila, there were two other Greek versions of the Old Testament Scriptures made; the first by Theodotion, who lived in the time of Commodus, the Roman emperor, and the other by Symmachus, who flourished a little after him in the reigns of Severus and Caracalla. The former is supposed to have belonged to Ephesus, and fell into the heretical errors of Ebion and Marcion, to which sect Symmachus also belonged, being by birth a Samaritan, and by profession first a Jew, then a Christian, and, lastly, an Ebionite heretic. They both of them undertook the making of their versions with the same design as Aquila did, although not entirely for the same end; for they all three entered on this work for the perverting of the Old Testament Scriptures. Aquila, however, did it for the serving of the interest of the Jewish religion, the other two for promoting the interest of the heretical sect to which they belonged; and all of them wrested the original Scriptures in their versions of them, as much as they could, to make them speak for the different ends which they proposed. From the circumstances, therefore, under which these versions were made, it may be inferred that their authority cannot be very great, though, from the fragments of them which have been collected, we may derive considerable assistance in understanding particular portions of the Old Testament.

In speaking of the ancient versions of the Bible, it must be observed, that there are two in the Syriac language—the Old, which is a translation of the Old Testament from the *Hebrew*, and the New, which is a translation of the New Testament from the *Greek*. This last is, beyond contradiction, the most ancient that ever was formed in the Christian church. It is that which the Christians in the east, called *Maronites*, make use of in their worship; and they, as well as the other Syrian Christians, boast very much of its antiquity; for they allege that one portion of it was made by the command of Solomon, for the use of Hiram, king of Tyre, and the other part by the command of Abgarus, king of Edessa. It is certain this version was of considerable antiquity, and was in all likelihood made within the first century after Christ, and had for its author some Christian of the Jewish nation that was thoroughly skilled in both the Hebrew and Syriac languages; and as it is amongst the oldest translations that we have of any part of the Scriptures, so it is the best, without any exception, that has been made of them by the ancients into any language whatsoever. This last character belongs to it in respect of the New Testament, as well as of the Old; and, therefore, of all the ancient versions which are now consulted by Christians for the better understanding of the Holy Scriptures, as well of the New Testament as of the Old, none can better serve this end than this old Syriac version, when carefully consulted and well understood. To this purpose the very nature of the language gives much assistance; for, it having been the mother-tongue of those who wrote the New Testament, and a dialect of that in which the Old was first given, many things of both are more happily expressed in it through this whole version than can well be done in any other language.

The language of princes generally becomes, in time, the common language of their subjects. The conquests of Alexander made the Greek tongue universal; and by the same means the Latin tongue extended itself, with the Roman empire, all over the world; so that, at length, there was scarce a nation where, by the help of this language, you might not make yourself understood.

It is not known who was the author of the first Latin version of the Scriptures; but St Augustine, a celebrated bishop of the Latin church, about A.D. 400, tells us that there soon appeared a great number of them. "We know them who translated the Scriptures into *Greek*," says he, "and the number of them is not great; but the number of the *Latin* translators is infinite. When the faith came to be established, the first man who found a Greek copy, notwithstanding the little knowledge he had of the two languages, boldly undertook a translation of it." From another passage of his writings it has been generally concluded, that there was one particular version, called "the Italian," in higher estimation than the rest, and which was the authorised version of the Roman churches. However this may be, it is certain the Latin church was in want of a version of the Scriptures formed directly from the Hebrew, as all the Latin translations in existence at that time had been taken from the SEVENTY. St Jerome, who was contemporary with St Augustine, was in every respect best suited, of any of the learned men of that time, to the task of making a new translation, which he accordingly undertook. He began by correcting some books of the Old Testament in the Latin Bible, particularly the version of the Psalms, and marked those passages wherein any difference existed between the Latin version, the Greek of the SEVENTY, and the Hebrew original. He had early applied himself to the study of the Hebrew language, and at different periods had the assistance of five Jewish teachers; he had access also to the works of Origen, who published what is called the *Hexapla*, that is, the Bible in *six* different languages. From these he must have derived considerable assistance in the work he undertook—that of translating into Latin all the books of the Old Testament, to which he added a corrected edition of the common version of the New.

This work of St Jerome is still used in the Roman Catholic church, and is known by the name of the *Vulgate*; for which some have gone so far as to claim the authority and infallibility of an inspired production. At first, however, his version was not generally received; for although many were pleased with it, because it was more consonant to the original, and a more literal translation than that of the SEVENTY; yet others, and among the rest Augustine, considered it a rash attempt, and calculated to diminish the authority of the Greek version. It was approved of by the Jews as conformable to their text, and was received into the church gradually and by tacit consent, rather than by the sanction of public authority.

Nevertheless, the *Vulgate* which we have at present, and which the celebrated Council of Trent declared to be authentic, is not the pure version of St Jerome; it has in it a great deal of the ancient *Italian;* but it cannot now be discovered by whom, or at what time, this mixture was made. Some think that St Jerome has no part at all in the present Vulgate; and it is certain that the *Psalms* in it are not his. Nevertheless, the Latin version comes nearer to the *Hebrew* and is more perspicuous, than the *Septuagint*. Since the time of the Council of Trent, namely, in 1589 and 1592, corrected editions of the Vulgate have been published under the authority of the Popes Sixtus the Fifth and Clement the Eighth.

DEER HUNTING IN AMERICA.

[BY AUDUBON.]

The different modes of destroying deer are probably too well understood and too successfully practised in the United States; for, notwithstanding the almost incredible abundance of these beautiful animals in our forests and prairies, such havoc is carried on amongst them, that, in a few centuries, they will probably be as scarce in America as the great bustard now is in Britain

We have three modes of hunting deer, each varying in some slight degree, in the different states and districts. The first is termed *still hunting*, and is by far the most destructive. The second is called *fire-light hunting*, and is next in its exterminating effects. The third, which may be looked upon as a mere amusement, is named *driving*. Although many deer are destroyed by this latter method, it is not by any means so pernicious as the others. These methods I shall describe separately.

Still Hunting is followed as a kind of trade by most of our frontier men. To be practised with success, it requires great activity, an expert management of the rifle, and a thorough knowledge of the forest, together with an intimate acquaintance with the habits of the deer, not only at different seasons of the year, but also at every hour of the day, as the hunter must be aware of the situations which the game prefers, and in which it is most likely to be found, at any particular time.

Illustrations of any kind require to be presented in the best possible light. We shall therefore suppose that we are now about to follow the *true hunter*, as the still hunter is also called, through the interior of the tangled woods, across morasses, ravines, and such places, where the game may prove more or less plentiful, even should none be found there in the first instance. We shall allow our hunter all the agility, patience, and care, which his occupation requires, and will march in his rear, as if we were spies, watching all his motions.

His dress, you observe, consists of a leather hunting-shirt, and a pair of trowsers of the same material. His feet are well moccassined; he wears a belt round his waist; his heavy rifle is resting on his brawny shoulder; on one side hangs his ball-pouch, surmounted by the horn of an ancient buffalo, once the terror of the herd, but now containing a pound of the best gunpowder; his butcher knife is scabbarded in the same strap; and behind is a tomahawk, the handle of which has been thrust through his girdle. He walks with so rapid a step, that probably few men, besides ourselves, that is, myself and my kind reader, could follow him, unless for a short distance, in their anxiety to witness his ruthless deeds. He stops, looks at the flint of his gun, its priming, and the leather cover of the lock, then glances his eye towards the sky, to judge of the course most likely to lead him to the game.

The heavens are clear, the red glare of the morning sun gleams through the lower branches of the lofty trees, the dew hangs in pearly drops at the top of every

leaf. Already has the emerald hue of the foliage been converted into the more glowing tints of our autumnal months. A slight frost appears on the fence-rails of his little corn-field. As he proceeds, he looks to the dead foliage under his feet, in search of the well-known traces of a buck's hoof. Now he bends toward the ground, on which something has attracted his attention. See! he alters his course, increases his speed, and will soon reach the opposite hill. Now he moves with caution, stops at almost every tree, and peeps forward, as if already within shooting distance of the game. He advances again, but how very slowly! He has reached the declivity, upon which the sun shines in all its growing splendour; but mark him! he takes the gun from his shoulder, has already thrown aside the leathern cover of the lock, and is wiping the edge of his flint with his tongue. Now he stands like a monumental figure, perhaps measuring the distance that lies between him and the game which he has in view. His rifle is slowly raised, the report follows, and he runs. Let us run also. Shall I speak to him, and ask him the result of this first essay? Assuredly, reader, for I know him well.

"Pray, friend, what have you killed?" for to say, "what have you shot at?" might imply the possibility of his having missed, and so might hurt his feelings? "Nothing but a buck." "And where is it?" "Oh, it has taken a jump or so, but I settled it, and will soon be with it. My ball struck, and must have gone through his heart." We arrive at the spot, where the animal had laid itself down among the grass in a thicket of grape-vines, sumachs, and spruce-bushes, where it intended to repose during the middle of the day. The place is covered with blood, the hoofs of the deer have left deep prints in the ground, as it bounced in the agonies produced by its wound; but the blood that has gushed from its side discloses the course which it has taken. We soon reach the spot. There lies the buck, its tongue out, its eye dim, its breath exhausted: it is dead. The hunter draws his knife, cuts the buck's throat almost asunder, and prepares to skin it. For this purpose he hangs it upon the branch of a tree. When the skin is removed, he cuts off the hams, and abandoning the rest of the carcase to the wolves and vultures, reloads his gun, flings the venison, enclosed by the skin, upon his back, secures it with a strap, and walks off in search of more game, well knowing that, in the immediate neighbourhood, another at least is to be found.

Had the weather been warmer, the hunter would have sought for the buck along the *shadowy* side of the hills. Had it been the spring season, he would have led us through some thick cane-brake, to the margin of some remote lake, where you would have seen the deer, immersed to his head in the water, to save his body from the tormenting attacks of moschettoes. Had winter overspread the earth with a covering of snow, he would have searched the low damp woods, where the mosses and lichens, on which at that period the deer feeds, abound, the trees being generally crusted with them for several feet from the ground. At one time he might have marked the places where the deer clears the velvet from his horns by rubbing them against the low stems of bushes, and where he frequently *scrapes* the earth with his fore-hoofs; at another, he would have betaken himself to places where persimons and crab-apples abound, as beneath these trees the deer frequently stops to munch their fruits. During early spring, our hunter would imitate the bleating of the doe, and thus frequently obtain both her and the fawn; or, like some tribes of Indians, he would prepare a deer's head, placed on a stick, and creeping with it amongst the tall grass of the prairies, would decoy the deer within reach of his rifle. But, kind reader, you have seen enough of the *still hunter*. Let it suffice for me to add, that by the mode pursued by him, thousands of deer are annually killed, many individuals shooting these animals merely for the skin, not caring for even the most valuable portions of the flesh, unless hunger, or a near market, induce them to carry off the hams.

The mode of destroying deer by *fire-light*, or, as it is named in some parts of the country, *forest-light*, never fails to produce a very singular feeling in him who witnesses it for the first time. There is something in it which at times appears awfully grand. At other times, a certain degree of fear creeps over the mind, and even affects the physical powers, of him who follows the hunter through the thick undergrowth of our woods, having to leap his horse over hundreds of huge fallen trunks, at one time impeded by a straggling grape-vine crossing his path, at another squeezed between two stubborn saplings, whilst their twigs come smack in his face, as his companion has forced his way through them. Again, he every now and then runs the risk of breaking his neck, by being suddenly pitched headlong on the ground, as his horse sinks into a hole covered over with moss. But I must proceed in a more regular manner, and leave you, kind reader, to judge whether such a mode of hunting would suit your taste or not.

The hunter has returned to his camp or his house, has rested and eaten of his game. He waits impatiently for the return of night. He has procured a quantity of pine-knots filled with resinous matter, and has an old frying-pan, that, for aught I know to the contrary, may have been used by his great grandmother, in which the pine-knots are to be placed when lighted. The horses stand saddled at the door. The hunter comes forth, his rifle slung on his shoulder and springs upon one of them, while his son, or a servant, mounts the other, with the frying-pan and the pine-knots. Thus accoutred, they proceed towards the interior of the forest. When they have arrived at the spot where the hunt is to begin, they strike fire with a flint and steel, and kindle the resinous wood. The person who carries the fire moves in the direction judged to be the best. The blaze illuminates the near objects, but the distant parts seem involved in deepest obscurity. The hunter who bears the gun keeps immediately in front, and after a while discovers before him two feeble lights, which are produced by the reflection of the pine-fire from the eyes of an animal of the deer or wolf kind. The animal stands quite still. To one unacquainted with this strange mode of hunting, the glare from its eyes might bring to his imagination some lost hobgoblin that had strayed from its usual haunts. The hunter, however, nowise intimidated, approaches the object, sometimes so near as to discern its form, when raising the rifle to his shoulder, he fires and kills it on the spot. He then dismounts, secures the skin and such portions of the flesh as he may want, in the manner already described, and continues his search through the greater part of the night, sometimes until the dawn of day, shooting from five to ten deer, should these animals be plentiful. This kind of hunting proves fatal, not to the deer alone, but also sometimes to wolves, and now and then to a horse or a cow, which may have straggled far into the woods.

Now, kind reader, prepare to mount a generous full blood Virginian hunter. See that your gun is in complete order, for, hark to the sound of the bugle and horn, and the mingled clamour of a pack of harriers! Your friends are waiting you, under the shade of the wood, and we must together go *driving* the light-footed deer. The distance over which one has to travel is seldom felt, when pleasure is anticipated as the result: so, galloping we go pell-mell through the woods, to some well known place, where many a fine buck has drooped its antlers under the ball of the hunter's rifle. The servants, who are called the *drivers*, have already begun their search. Their voices are heard exciting the hounds, and unless we put spurs to our steeds, we may be too late at our stand, and thus lose the first opportunity of shooting the fleeting game, as it passes by. Hark again! The dogs are in chase, the horn sounds louder and more clearly. Hurry, hurry on, or we shall be sadly behind!

Here we are at last! Dismount, fasten your horse to this tree, place yourself by the side of that large yellow poplar, and mind you do not shoot me! The deer is fast approaching. I will to my own stand, and he who shoots him dead wins the prize.

The deer is heard coming. It has inadvertently cracked a dead stick with its hoof, and the dogs are now so near it that it will pass in a moment. There it comes! How beautifully it bounds over the ground! What a splendid head of horns! How easy its attitudes, depending, as it seems to do, on its own swiftness for safety! All is in vain, however: a gun is fired, the animal plunges and doubles with incomparable speed. There he goes! He passes another stand, from which a second shot, better directed than the first, brings him to the ground. The dogs, the servants, the sportsmen, are now rushing forward to the spot. The hunter who has shot it is congratulated on his skill or good luck, and the chase begins again in some other part of the woods.

A few lines of explanation may be required to convey a clear idea of this mode of hunting. Deer are fond of following and retracing the paths which they have formerly pursued, and continue to do so even after they have been shot at more than once. These tracks are discovered by persons on horseback in the woods, or a deer is observed crossing a road, a field, or a small stream. When this has been noticed twice, the deer may be shot from the places called *stands* by the sportsman, who is stationed there, and waits for it, a line of stands being generally formed so as to cross the path which the game will follow. The person who ascertains the usual pass of the game, or discovers the parts where the animal feeds or lies down during the day, gives intimation to his friends, who then prepare for the chase. The servants start the deer with the hounds, and, by good management, generally succeed in making it run the course that will soonest bring it to its death. But, should the deer be cautious, and take another course, the hunters, mounted on swift horses, gallop through the woods to intercept it, guided by the sound of the horns and the cry of the dogs, and frequently succeed in shooting it. This sport is extremely agreeable, and proves successful on almost every occasion.—*From Audubon's American Ornithology.*

APRIL.

On April, in old kalendars, is drawn
A gallant hawker pacing on a lawn,
Holding a bell'd and hooded fowl of prey,
Ready to loose him in the airy way.
For daily now descends the solar beam,
And the warm earth seems in a waking dream;
Insects creep out, leaves burst, and flowers rise,
And birds enchant the woods, and wing the skies;
Each sentient being a new sense receives,
And eloquently looks, to each, it lives.

APRIL, whose name is derived from a Latin word, signifying *to open*, is celebrated by writers as one of the most delightful months in the year. "April," says the author of the *Mirror of the Months*, "is spring—the only spring month that we possess—the most juvenile of the months, and the most feminine—the sweetest month of all the year; partly because it ushers in the May, and partly for its own sake, so far as any thing can be valuable without reference to any thing else. It is to May and June what 'sweet fifteen,' in the age of woman, is to passion-stricken eighteen, and perfect two-and-twenty. It is worth two Mays, because it tells tales of May in every sigh that it breathes, and every tear that it lets fall. It is the harbinger, the herald, the promise, the prophecy, the foretaste of all the beauties that are to follow it—of all, and more—of all the delights of summer, and all the 'pride, pomp, and circumstance' of glorious autumn. It is fraught with beauties that no other month can bring before us, and

'It bears a glass which shows us many more.'

Its life is one sweet alternation of smiles and sighs and tears, and tears and sighs and smiles, till it is consummated at last in the open laughter of May."

By the same writer we are directed to observe, "what a sweet flush of new green has started up to the face of this meadow! and the new-born daisies that stud it here and there, give it the look of an emerald sky, powdered with snowy stars. In making our way to yonder hedgerow, which divides the meadow from the little copse that lines one side of it, let us not take the shortest way, but keep religiously to the little footpath; for the young grass is as yet too tender to bear being trod upon; and the young lambs themselves, while they go cropping its crisp points, let the sweet daisies alone, as if they loved to look upon a sight as pretty and as innocent as themselves." It is further remarked that "the great charm of this month, both in the open country and the garden, is undoubtedly the infinite *green* which pervades it every where, and which we had best gaze our fill at while we may, as it lasts but a little while—changing in a few weeks into an endless variety of shades and tints, that are equivalent to as many different colours. It is this, and the budding forth of every living member of the vegetable world, after its long winter death, that, in fact, constitutes *the spring*; and the sight of which affects us in the manner it does, from various causes—chiefly moral and associated ones; but one of which is unquestionably physical: I mean the sight of so much tender green after the eye has been condemned to look for months and months on the mere negation of all colour, which prevails in winter in our climate. The eye feels cheered, cherished, and regaled by this colour, as the tongue does by a quick and pleasant taste, after having long palated nothing but tasteless and insipid things. This is the principal charm of spring, no doubt. But another, and one that is scarcely second to this, is the bright flush of blossoms that prevails over, and almost hides, every thing else in the fruit-garden and orchard. What exquisite differences and distinctions and resemblances there are between all the various blossoms of the fruit trees; and no less in their general effect than in their separate details. The almond-blossom, which comes first of all and while the tree is quite bare of leaves, is of a bright blush-rose colour; and when they are fully blown, the tree, if it has been kept to a compact head instead of being permitted to straggle, looks like one huge rose, magnified by some fairy magic to deck the bosom of some fair giantess. The various kinds of plum follow, the blossoms of which are snow-white, and as full and clustering as those of the almond. The peach and nectarine, which are now full blown, are unlike either of the above; and their sweet effect, as if growing out of the hard bare wall, or the rough wooden pailing, is peculiarly pretty. They are of a deep blush colour, and of a delicate bell shape; the lips, however, divided, and turning backward, to expose the interior to the cherishing sun. But perhaps the bloom that is richest and most *promising* in its general appearance, is that of the cherry, clasping its white honours all round the long straight branches, from heel to point, and not letting a leaf or a bit of stem be seen, except the three or four leaves that come as a green finish at the extremity of each branch. The other blossoms of the pears and (loveliest of all) the apples do not come in perfection till next month."

No communications in verse or prose are wanted. All anonymous or unpaid letters are regularly returned to the Post Office without any attention to their contents.

NAMES.

"WHAT's in a name?" is the question asked by the passionate Juliet, when anxious to annihilate the space which the name and lineage of Romeo have cast between her and her lover. The same question has been asked a thousand times on lighter occasions, and generally answered, through an absence of all reflection —Nothing. This proceeds, in some measure, upon an understanding that Shakspeare has here professed *his* sense of the insignificance of a name; whereas, if we trace the play to its conclusion, it will be apparent that it was altogether designed to show how much there might be in such a small matter—no less, to wit, than the ruin of a pair otherwise fitted to render each other happy. Throwing this poetical instance out of view, it will be obvious enough, we think, from the ordinary run of facts in common life, that, though a name is in many cases a matter of indifference, it is fully as often one of material importance. In all parts of the United Kingdom there are names of the most ludicrous and vulgar sound, such as Hogsflesh, Higginbottom, Clutterbuck, Gotobed, Meiklewham, M'Turk, &c. Now, these may do very well for people who have no desire to soar beyond a very humble sphere of usefulness. But we contend, that, if a man of high intellectual capabilities were born with such a designation—and no doubt there have been many men so circumstanced—his name would be an effectual bar to prevent him from coming into notice. Suppose the bent of his genius lay towards a military life, could the glory of a Cæsar or a Napoleon be reaped under the name of Hogsflesh? Were he to affect poetry, could any new epic approaching to the Paradise Lost be published with the name of Gotobed upon the title-page? No—there has been a good fortune in all great men hitherto as to their names: all of them have had smooth, euphonious, or at least not ridiculous, designations; and the public may depend upon it, that, though not a positive, it has been at least a negative cause of their success—it has at least not prevented them from coming before the world, and reaping the full benefit of their talents. Alas, however, for the Hogsfleshes and the Higginbottoms!—alas for the innocent Clutterbucks and Meiklewhams! How many of these unhappy clans, with all the power and all the will to shine, have been deterred from even attempting to scribble their names in the book of Fame, conscious that the very sound would startle and disgust the world, and procure nothing but laughter and sarcasm for all their noblest efforts! Good worthy Gotobeds, it might wake Gray himself from the dead, to think how many of you have been mute and inglorious, not for want of opportunity, or any of the other accessory aids, but simply because you trembled to give the world your address, and, thrusting back your cards into your pockets, resolved rather to die as drysalters and bakers, than shock the ears of mankind with a sound so soporiferous and so ungraceful.

Then, again, some names, though tolerable enough, are so very common, that they give no distinction, but, on the contrary, almost appear to preclude it. The name John Smith, for instance, is a very decent name; it has been borne, no doubt, by many respectable persons in all ranks of life. But who could rationally expect, with such a name, to carve out for himself a reputation for either poetry, science, or military prowess? Why, he is lost in the myriad of John Smiths, and could no more extricate himself, so as to assume a distinct and distinguished position, than he could fly in the air, or walk upon the water. A man thus entitled bears about him a doom of everlasting mediocrity, which he can no more reverse than he can regenerate his bodily constitution. He is John Smith, and he will never be more than John Smith, though he were to live to the verge of time. He might be naturally capable of saying the brightest things, of making the most useful discoveries, of embodying the most beautiful and affecting sentiments; but let his name accompany them, and they are heard of no more. That common-place sound would dispel the admiration of a world, and cause him to sink at once, with all his fictitious glory, into the humbler shades of life. Down he would go, like a plummet, though he had the Waverley novels disposed like a cork-jacket all around him. His only chance of success is in anonymity, and, of course, if he is to remain for ever anonymous, he gains no fame. We are fully persuaded that Junius was a man of the name of John Smith—a greatly unfortunate man, not fearful of acknowledging his work for any thing that kings or men could do to him, or any other consideration whatever, than simply that he could not endure the idea of exploding all the utility and all the estimation of his piquant writings, by putting such a name upon the title-page.

The non-distinction of the name Dr Brown has been already illustrated, we believe, in an English comic song; and it is very remarkable, that, though there have been many literary and scientific characters bearing this designation, hardly one of them has ever found it possible to gain more than a comparatively local fame. What Doctor is to Brown, Captain is to Campbell—an inseparable adjunct, and one which tends quite as much to take away the individuality it pretends to give. The legion of the Captain Campbells, as they may well be called, might be a staff for the formation of a new army. There is a Captain Campbell in Scotland for every other hundred men. They might colonize a fifth continent. How much good broad-cloth, how many pairs of respectable Wellington boots, have been worn away upon the limbs of the Captain Campbells, without any one of them having ever been singled out from the rest! No doubt, the Captain Campbells have all been capital fighters in their day: if war has ever done us any good at all, no small portion of that good has been gained by the Captain Campbells. But the misfortune is, that there are too many of them. Their glory is like a chandelier, where no single candle makes any great appearance; whereas, if there were only one of them, he would be like one light in a room, and his usefulness would be at once seen, and prized accordingly. The only advice that could be given to a man of this unfortunate designation, who wanted to signalize himself, would be, that he should commence a tour of the earth in search of a place where there was not another Captain Campbell within ten miles. If such a place there be, let him settle down upon it, with a happy mind, and try what he can do in the way of public service, though it should only be as executioner to the Grand Turk. But if he can no where find such a spot of earth, why, then, unless he becomes a kind of shoemaker of Cordova, and quietly poniards all his namesakes that fall in his way, we fear there is no hope for him.

Walter Scott was fortunate in his name. Had he been called Thomas Scott, or John Scott, there is a great chance of his never having arrived at the distinction he did. Robert Burns was similarly fortunate. His father luckily changed the family designation from *Burness*, which would never have done as the name of a poet. Vulgar family names, it has to be observed, may be greatly meliorated by the use of some fine-sounding classic Christian name. For instance, the addition of *Horace* to *Smith*, saves the plainness of the appellation vastly, and makes it fit for a title-page. We recommend fathers of families with common names to attend to this in the christening of their children. We have often regretted the slavishness with which the most of people adhere to old custom in this duty. The first children of the family are regularly called after their grandfathers and grandmothers, and those which follow, after even nearer relations, so that old plain names are perpetuated, and there is no distinguishing one person from another, either now or in future times. We have heard genealogists and lawyers complain much of this stupid system, and express their belief that many fortunes have been lost by it. Surnames are sometimes given as Christian names to children, as Douglas, Stewart, Dundas, Nelson, &c. This is an intolerably mean custom, and afterwards marks the father as having been a dependent or expectant in some shape of the great man whose name he has adopted. Whenever we hear of a person with a surname for a first name, we have an idea that his father was a footman. A Christian name formed of a complete name of another person, is nearly as bad. A double Christian name, as William Frederick, is now in most cases the result of pure affectation, and is so much in use among characters of questionable respectability, that it ought, if possible, to be discarded. The giving of a name to a child is one of the important trifling duties of human life, and, as such, requires a little more attention than what is usually bestowed on it. Let parents, therefore, take note of these hints, and give their children some really pleasing single Christian name, without regard to whether it was ever before in the family, and holding in view that it will be one which will suit any rank in life, and any distinction which the young individuals may attain.

THE NEIGHBOURHOOD OF ST PAUL'S.

STRANGERS would hardly be able to pick their way through the metropolis, were they not guided by the great leading thoroughfares. By attending to these, there is no difficulty in the matter. Several thoroughfares from different quarters in the east—for instance, one proceeding up from the Tower and shipping places, and another by Leadenhall Street from the north-eastern suburbs—converge into a point at the eastern extremity of Cheapside. This is one of the finest commercial streets in the world, and there is, perhaps, more real wealth in and about its precincts than in some half dozen continental kingdoms. The houses —of brick, of course—are tall, to be London houses, and are compactly built together, the whole of the lower parts being the shops of drapers, and other tradesmen. Nothing can equal the bustle that generally prevails. The various eastern and western thoroughfares having poured in their contribution of waggons, and other vehicles, the whole have necessarily to pass through this street before emerging at either extremity; and thus the traffic is prodigious. The din in the centre of the street is not more distracting than the rapid rushing onwards of the crowds of passengers, chiefly men engaged in business, or proceeding probably to or from the Exchange, the Bank, or the commercial marts in their neighbourhood, all situated near the eastern termination of Cheapside. In proceeding westward, this main avenue is interrupted in such a way as to part off into two lines: that to the right, or north, continues through Newgate Street, Skinner Street, Holborn, Broad Street, and Oxford Street, till it arrive in the country; that to the left, or south, nearer the Thames, which guides it, continues through St Paul's Churchyard, Ludgate Hill, Fleet Street, and the Strand. At the western extremity of the Strand, the line again parts into two: that to the right proceeding by Pall Mall, St James's

Street, and Piccadilly, to the parks; and that to the left continuing through Whitehall and Parliament Street, to the Houses of Parliament and Westminster Abbey. As the provincial perambulates Cheapside with a view to a journey into the western or fashionable regions, he perceives a great density of streets, houses, population, and commerce. On coming to the end of Cheapside, if he do not take care, he will march up Paternoster Row, which lies straight before him; but if he has studied his map to some purpose, he rounds the corner into St Paul's Churchyard. Here is quite a new scene. In the midst of a confined open area, and surrounded by a massive iron railing, stands the huge edifice, St Paul's Cathedral, appearing like a number of large churches piled a-top of each other, with rows upon rows of pillars, and surmounted by an immense but graceful dome, whose lofty head is reared above the whole of the structures of the metropolis.

St Paul's!—who has not heard of this far-famed boast of the capital, or, we might say, of the country at large? Surely, we may pause a little, to take a narrower view of its dimensions. This magnificent building stands on a spot of ground which has been consecrated to religious purposes for twelve hundred years. A Christian church was planted here four hundred years before the Norman conquest, and, under various shapes and extensions, it remained till destroyed by the great fire in London, in 1666. An entirely new edifice was then erected in its stead, the important work being committed to Sir Christopher Wren. It is built in the form of a Greek cross, and measures 514 feet in length, 286 in breadth, and 370 in height, to the topmost pinnacle. Outwardly, the walls, which have a dark sooty appearance, except where bleached with the rains, are what we would call two storeys in height, there being two rows of windows. There are three porticoes at as many entrances, on the north, west, and south. That on the west is the principal, with twelve lofty Corinthian pillars below, and the angles above crowned with handsome bell towers, the size of ordinary church towers or steeples. But this entrance, which fronts the street called Ludgate Hill, is apparently disused, and the common entrance is by the north portico and flight of steps. You are admitted to the interior by a small wicket of the door of this entrance, admission being given on paying the sum of *twopence*. On entering this large show, nothing appears any way remarkable but the vastness of the open space, especially overhead beneath the dome. The walls and arches have rather a clumsy aspect, and the contour is far inferior to that of the interior of York Minster. The sides of the aisles are garnished with statues and sepulchral monuments; but while many are well executed, there is, upon the whole, as in the case of Westminster Abbey, too much straining after effect, by giving emblematic figures, and indulging in other silly conceits, by no means natural. Through some fine open screen-work, a view is obtained of the place where the usual services are performed, and which is highly decorated with dark oaken carved work. If the stranger pleases, he may mount by means of stairs and ladders to the top of the cupola; and though he be taxed in a small sum at the different stages, he will be amply repaid by the extensive view from the balcony or gallery, which comprehends the whole of London, with the country beyond its outskirts, and the Thames rolling placidly in its winding course through the dense mass of houses. Altogether, St Paul's is a magnificent structure; and though it cost a million and a half of money in the erection—and that was a great sum in the seventeenth century—the price was well spent by the nation on so worthy an object. St Paul's is, nevertheless, only a curiosity, it being of no practical use or benefit as a place of public worship, at least not more so than the smallest chapel in London.

The clock-work and great bell of St Paul's always attract the notice of visitors. The pendulum measures fourteen feet in length, while the mass at its extremity is one hundred weight. The great bell—the bell of St Paul's—the bell which is only rung when a member of the royal family dies—the bell which, according to Skryme the apothecary, and the other wise heads in Little Britain, turns all the beer sour by its ringing—is placed in the southern turret above the western portico, and weighs four and a half tons, and is ten feet in diameter. The fine deep tones of this mighty bell sweep solemnly of an evening across the metropolis, and are heard distinctly by families at their firesides, several miles distant. At night,

"When all the air a solemn stillness holds,"

the strokes, we are told, may be heard at the distance of twenty miles.

In the immediate vicinity of St Paul's, the town has a sort of retired cloistered appearance, the names of the very streets and lanes giving token of their former connection with the religious structure, and its clerical attendants. The enclosed churchyard is surrounded by a street, not of the broadest dimensions, closely hemmed in with houses, now chiefly dedicated to trade, the lower storeys being, as usual, shops. The "Corner of St Paul's Churchyard" is an expression which awakens in our mind the most delightful reminiscences of our boyish days: what stranger visits the metropolis who does not start with pleasure at sight of the well-remembered "corner," which for half a century has flourished in immortal youth on the tiny pages of the neat little books got up by the worthy Mr Newberry for the "divertisement" and "moral improvement" of all good boys and girls? "Ah!" said Tommy to himself, as he leaned his head upon his hand, "if I could but get to read all the nice little books in Mr Newberry's shop, at the corner of St Paul's Churchyard, I should be the happiest boy in London." Such was the soliloquy of Master Thomas Trip, a young gentleman with whom we were all, less or more, on terms of intimacy in the days of boyhood. The far-famed shop of Mr Newberry still exists, though in a modernized form, at the right hand corner as you pass out of the churchyard into Ludgate Hill.

Paternoster Row, we said, was in some measure a continuation of Cheapside. Such is the case, but it is not used as a thoroughfare, though it communicates by transverse alleys or courts with the churchyard, and, at its western extremity, by means of another cross alley, called Ave-Maria Lane, leads into Ludgate Hill. Paternoster Row, or "the Row," as it is familiarly termed, is a longish, dull, narrow street, hardly wide enough to permit two carriages to pass each other, with a narrow pavement for a single rank and file on each side, and a gutter in the middle. The houses are tall, and sombre in their aspect, and the shops below have a dead look in comparison with those in the more animated streets. From a very remote period, this alley has been the seat of trade of booksellers and publishers, who, till the present day, continue in such numbers as to leave little room for other tradesmen in its precincts. The book-shops here have all, to a greater or less extent, an air of set-down respectability about them. They are not of that bedizened flashy character so common in other quarters. Their doors are mostly shut, as if business was of little consequence; and it is tolerably evident they depend more on their literary reputations, or connection with foreign countries, as well as customers in the provinces, than on mere outward show. There is generally a quiet coolness about "the Row," very different from the heat and bustle of Cheapside or Ludgate Hill, from whence the hum of traffic is wafted to the ear. But on the last day and evening of the month, a very different scene is presented. The Row is all agog, like a hive on a bright summer's day; the great process of monthly publication being actively going forward. To-morrow is "Magazine day," and we do not doubt that no fewer than 100,000 numbers, and parts of periodicals, are in the course of being dispatched in bales and packages to all parts of the United Kingdom.

NATURAL HISTORY.

QUADRUPEDS CONTINUED.

The second family of quadrupeds, which are of a carnivorous nature, have six cutting teeth in each jaw, with the grinders or molar teeth generally edged, sometimes with tubercles, but never having rough pointed tubercles on their crown, and always provided with strong canine teeth.

The first tribe consists of plantigrade animals, or such as have the whole sole of the foot resting on the ground when walking. The first genus is the *Ursus*, or bear, which has six cutting teeth in both jaws, and one canine tooth in each side of the cutting teeth in each jaw, and from four to seven molar teeth in each jaw on both sides, making a total of from thirty-two to forty-four. The body is thick, and covered with strong hairs; the ears are somewhat long, and slightly acuminated; they have five strong toes on each foot, provided with long, curved, and strong claws, blunt at the edges. The tail is short.

Bears are large ill-shapen animals, with thick and clumsy limbs. The cartilage of their nose is moveable. They usually live in deep burrows of their own digging, or in caves, where they pass the winter in a kind of torpidity, and generally without taking any kind of food, subsisting on the absorption of the fat which he has accumulated in the course of the summer. The females bring forth in the month of January in these retreats, and generally produce two at a birth.

The Brown Bear was at one time an inhabitant of Great Britain, as well as of the whole European Continent, but has now been completely extirpated from this country, as well as from France, Germany, and Holland. But in Russia, Bohemia, Poland, and the Alps, it is to be found pretty plentiful, and as far to the east as Japan and Kamschatka.

The usual size of the brown bear is about four feet in length, although they sometimes measure five feet. One which was lately exhibited in the streets of Edinburgh, when walking upright, was nearly six feet in height. The colour is of a dark burnt-umber brown, but nearly black on the legs and feet.

The brown bear is an animal of solitary habits, and continues associated with his mate for a very short time, and then retires to some sequestered cavern, hole in a tree, or pit in the earth.

It is but seldom that the bear will attack man in a wild state, unless provoked by some aggression; but if roused, he proves a formidable and furious enemy. He can climb trees with much ease.

The brown bear lives almost entirely on vegetable food, and it is only when very hungry that he seeks to eat flesh. The whole of this kind are said to be fond of honey; and the natives of Russia, taking advantage of this, form various plans for entrapping them. They fix a heavy log of wood to the trees on which bees have a hive, attached by a long string. The bear climbs the tree in search of the honey, and, finding himself interrupted by the log, he forces it aside, and attempts to pass it; but in returning, it strikes against him with considerable force, and, exciting him, he renews his exertions, till he becomes furious, and continues his obstinate attempts until he is either killed or falls senseless from the tree.

History informs us, that, in early times, bear-baiting was a favourite amusement in England. Sir Thomas Pope entertained Queen Mary and the Princess Elizabeth, at Hatfield, with an exhibition of this barbarous sport, which is said to have afforded them high gratification; and we are told that it was one of the amusements of Kenilworth Castle. Rowland White mentions, that, when Queen Elizabeth was in her sixty-seventh year, she enjoyed the sports of bull and bear-baiting in the tilt-yard. During this and other reigns, there was a special officer appointed for the care of the bears, who had a salary of sixteen pence a-day. It was his duty to provide bears and dogs, and to superintend the sport of baiting; and such was the arbitrary state of the times, that this officer had unlimited powers to send his under-officers to all parts of the kingdom, with authority to seize and carry off bulls, bears, or dogs, for the amusement of his royal master, and for which there was no redress.

We have no public record of this amusement having been sanctioned by royal authority, later than the 11th October 1561, when a patent was given to Sir Saunders Duncombe "*for the sole practice and profit of fighting and combating of wild and domestic beasts within the realm of England, for the space of fourteen years.*" These cruel sports were sometimes, although but seldom, practised in England so late as the middle of the eighteenth century. On the Continent, however, the sport of bear-baiting is still practised.

Leopold, Duke of Lorraine, had a bear, called Marco, that possessed great sagacity and sensibility, of which the following is a remarkable instance:—During the winter of the year 1709, a Savoyard boy, who was ready to perish with cold in a barn, in which he had been put by a farmer's wife, thought proper to enter Marco's hut, without reflecting on the danger which he ran in exposing himself to the mercy of the animal which occupied it. Marco, however, instead of doing any injury to the child, took him between his paws, and warmed him by pressing him to his breast until next morning, when he suffered him to depart, to ramble about the city. The young Savoyard returned in the morning to the hut, and was received with the same affection. For several days he had no other retreat; and it added not a little to his joy to perceive that the bear regularly reserved part of his food for him. A number of days passed in this manner, without the servants of the duke knowing any thing of the circumstance. At length, when one of them came one day to bring the bear its supper, rather later than ordinary, he was astonished to see the animal roll his eyes in a furious manner, and seeming as if he wished him to make as little noise as possible, for fear of awaking the child, whom he clasped to his breast. The bear, though ravenous, did not appear the least moved with the food which was placed before him. The report of this extraordinary circumstance was soon spread at court, and reached the ears of Leopold, who, with part of his courtiers, was desirous of being satisfied with the truth of Marco's generosity; several of them passed the night near his hut, and beheld with asto-

nishment that the bear never stirred as long as his guest showed an inclination to sleep. At break of day the child awoke, was very much ashamed to find himself discovered, and fearing that he would be punished for his temerity, begged pardon of those who were present. The bear, however, caressed him, and endeavoured to prevail on him to eat what had been brought to him on the evening before, which he did at the request of the spectators, who afterwards conducted him to the duke. Having learned the whole history of this singular alliance, and the time which it had continued, Leopold ordered the little Savoyard to be taken care of, who, doubtless, would have soon made his fortune, but he died soon afterwards.

When George the Third was Prince of Wales, he had a bear presented to him, and which was kept in the Tower of London. On one occasion, a servant carelessly left the door of the den in which it was kept open; the keeper's wife happening to cross the court, the bear flew out, seized the woman, threw her down, and fastened upon her neck, which he bit, and, without offering any farther violence, lay upon her, sucking the blood out of the wound. Resistance was in vain, as it only served to irritate the animal, and she must inevitably have perished, had not her husband luckily discovered her situation. By a sudden blow, he obliged the bear to quit his hold, and retire to his den, which he did with much reluctance, and not without making a second attempt to come at the woman, who was almost dead, through fear and loss of blood. He always afterwards growled whenever he saw this woman, and made violent efforts to reach her. The Prince, upon hearing of the circumstance, ordered the bear to be killed.

The following incident is told by Munster:—"A Muscovite peasant, while in search of honey in the woods, mounted a very large tree, whose trunk was hollow in the centre, and discovered that it contained a great quantity of honey-comb; he descended into the interior, where he stuck fast in the honey, which had been accumulated there to a considerable depth, when he found that all his efforts to withdraw himself proved unavailing; and what added to the horror of his situation was, that the tree was in such a remote and sequestered part of the wood, that to attempt to call for assistance seemed a hopeless effort, as it was quite impossible his voice could be heard. Here he remained two days, and allayed his hunger with the honey, and fairly gave himself up to despair, when a bear, who like himself was in search of honey, mounted the tree, and descended the hollow cleft with his hind quarters forward. The man was at first alarmed, but at length mustered courage to lay hold of the bear with all his strength, upon which the animal seemed to be seized with a panic, made a speedy retreat, and dragged the man after him. When fairly extricated from the honey, he quitted his hold, and the bear made the best of its way to the ground, and escaped."

In the travels of Captains Lewis and Clark to the source of the Missouri, we find the following illustration of the great physical powers of the brown bear:—

"One evening, the men in the hindmost of the canoes discovered a large brown bear lying in the open ground, about three hundred paces from the river. Six of them, all good hunters, set out to attack him, and, concealing themselves by a small eminence, came unperceived within forty paces of him. Four of them now fired, and each lodged a ball in his body, two of them directly through the lungs. The enraged animal sprang up, and ran open-mouthed at them. As he came near, the two hunters who had reserved their fire gave him two wounds, one of which breaking his shoulder, retarded his motion for a moment; but, before they could reload, he was so near that they were obliged to run to the river, and when they reached it, he had almost overtaken them. Two jumped into the canoe; the other four separated, and, concealing themselves in the willows, fired as fast as each could load. They struck him several times, which only exasperated him; and he at last pursued two of them so closely, that they leaped down a perpendicular bank of twenty feet into the river. The bear sprang after them, and was within a few feet of the hindmost, when one of the hunters from the shore shot him in the head, and killed him. They dragged him to the banks of the river, and found that eight balls had passed through his body."

THE TWIN FLOWERS,

AN AMERICAN STORY.

"Will you buy my flowers?" said a neat-looking girl, addressing herself to a young lady in Chestnut Street, and holding out, at the same time, a small basket containing some beautiful roses; "they are newly blown and fresh; buy a red rose for your hair, Miss? here's one that will look delightful twined among those pretty locks." "Not a rose, my child," said the young lady; "there are thorns among them; but I'll take this little flower, it looks so lively and sweet; oh, it's a forget-me-not!" "Pardon me, Miss," replied the child; "that flower is engaged." "To whom?" "To Master Charles Leland." "Charles Leland, indeed," said the lady; "well, but here's another; what a beautiful pair!" "They are twin flowers—they are both for that gentleman," said the little girl. "Oh, a fig for him," said the young lady; but an arch smile played upon her cheek as she said it, and something sparkled in her beautiful dark eye that told a tale her lips refused to utter; while she ingeniously marked both the favourite flowers, and returned them to the basket; then choosing a little bunch of roses, she walked home, leaving the flower girl to visit the rest of her customers.

Love is impatient; and Harriet counted the tedious minutes as she sat at her window and listened for the well-known rap. The clock struck nine, and yet Leland did not appear; she thought he had been neglectful of late, but then the flowers; he knew they were favourites of hers, and she thought to receive them from his hand; and to hear him say, "Harriet, forget me not," would be a sweet atonement for many little offences past. But once the thought stole to her bosom—perhaps they are destined for another! She banished it with a sigh, and it had hardly escaped her ere Charles Leland entered. She rose to receive him, and he gently took her hand. "Accept," said he, "my humble offering, and forget me"—Harriet interrupted him as he attempted to place a single flower in her bosom. "Where is the other?" said she, as she playfully put back his hand. A moment's silence ensued; Charles appeared embarrassed, and Harriet, recollecting herself, blushed deeply, and turned it off; but the flower was not offered again, and Charles had only said forget me!

This could not have been all he intended to say, but mutual reserve rendered the remainder of the evening cold, formal, and insipid; and when Leland took his leave, Harriet felt more than ever dissatisfied. As it was not yet late in the evening, she resolved to dissipate the melancholy that this little interview, in spite of all her efforts to laugh at it, left on her mind, by spending a few minutes at a neighbour's, whose three daughters were her most intimate companions.

The youngest of these ladies was a gay and interesting girl, and was the first to meet and welcome her young friend, but, as she held out her hand, Harriet discovered a little flower in it; it was a forget-me-not. She examined it—it was one of Leland's; the mark she had made upon it, when she took it from the basket of the flower girl, was there. This was, at the moment, an unfortunate discovery. She had heard that Charles frequently visited this family, and that he even paid attention to Jane; but she had never before believed it; and now she shuddered at the idea of admitting that for once rumour told truth. "Where did you get this pretty flower, Jane?" said she. "Oh, from a beau to be sure," said Jane, archly; "don't you see, forget-me-not;" and as she took back the flower, "I should not like to tell you where I got it; I'll wear it in my bosom though—come, sing:—

> I'll dearly love this pretty flower,
> For his own sake who bid me keep it;
> I'll wear it in my bosom's ——

"Hush, Jane," said Harriet, interrupting her; "my head aches, and your singing distracts me." "Ah, it's your heart," said Jane, "or you would not look so dull." "Well, if it is my heart," said Harriet, as she turned to conceal her tears, "it does not become a friend to trifle with it." She intended to convey a double meaning in this reply, but it was not taken, and, as soon as possible, she returned home.

A sleepless night followed: Harriet felt that she was injured, and the more she thought about it, the more she felt. She had engaged her hand to Leland six months before; the time appointed for their union was approaching fast; and he acted thus! "If he wants to be freed from his engagements," she said to herself, "I will give him no trouble," and she sat down and wrote, requesting him to discontinue his visits. She wept over it a flood of tears, but she was resolute, until she had dispatched the note to his residence. Then she repented of it, and then again reasoned herself into the belief that she had acted right. She waited for the result, not without many anxiously cherished hopes that he would call for an explanation. But she only learned that the note was delivered into his hands; and, about a month afterwards, he sailed for England.

This was an end to the matter. Charles went into business in Liverpool, but never married; and Harriet remained single, devoting her life to the care of her aged mother, and ministering to the wants of the poor and distressed around her.

About forty years after Leland left Philadelphia, Harriet paid a visit to New York; and dining in a large company one day, an old gentleman, who, it seemed, was a bachelor, being called upon to defend the fraternity to which he belonged from the aspersions of some of the younger and more fortunate part of the company, told a story about Philadelphia, and an engagement which he alleged was broken off by his capricious mistress, for no other reason than his offering her a sweet new-blown forget-me-not, six weeks before she was to have been made his wife. "But was there no other cause?" asked Harriet, who sat nearly opposite the stranger, and eyed him with intense curiosity. "None to my knowledge, as Heaven is my witness." "Then what did you do with the other flower?" said Harriet. The stranger gazed in astonishment. It was Leland himself, and he recognised his Harriet, though almost half a century had passed since they had met; and before they parted, the mischief made by the twin flowers was all explained away, and might have been forty years before. had Charles said he had lost one of the forget-me-nots, or had Jane said she had found it. The old couple never married; but they corresponded constantly afterwards: and it was always observed, that Harriet looked happier after this meeting than she ever looked before.

NARRATIVE OF AN ADVENTURE AT SEA.

It was somewhere near the middle of the ocean, on our homeward passage from Jamaica, that we fell in with the wreck of a vessel, and several poor souls clinging to the rigging. The weather, for some days before, had been rough, with hard gales from the north-east, and our ship being heavy laden, we were much afraid that she would founder. For a time we gave ourselves up to despair, seeing nothing around us but certain death. We drove at the mercy of the tempest, without being able to set a stitch of sail, and we expected every moment that our masts would go by the board. Several large seas broke over us, one of which carried away a boy and two seamen, as well as our best boat, upon which we mainly relied for assistance, in case we had been forced to leave our vessel. When we were in the greatest extremity, however, and every one on board, like the seamen in the ship of Tarshish, was calling upon his God, the storm suddenly abated, and the wind, veering round to the south-west, blew a brisk and steady breeze.

The captain, now taking an observation, found that we had been driven to the southward several hundred leagues out of our course; but we set all our canvass again, and bore away in the right track; and a double allowance of grog being handed out to the seamen, we soon forgot our late dangers, and laughed and talked as merrily as if nothing evil had happened.

After some days' sail, the man at the mast-head, one evening, called out, "On deck there! Breakers a-head!" and the vessel, which was then going at the rate of ten knots an hour, was immediately brought to. The old seamen said that no breakers were known in that part of the ocean, and that they had sailed in that course twenty times, and had never seen any. The captain took his spy-glass, and going up into the fore-shrouds, soon found that it was the hull of a vessel, half sunk, and part of a mast standing, which the man had mistaken for rocks. He looked sulky when he came down, and ordered us to proceed. As we approached the wreck, we observed the people upon it making signals to us with their hats and handkerchiefs; and the captain, having gone below for a few minutes, the mate hoisted the English jack as a token that we had observed them; but the captain, when he came again upon deck, was angry with him for so doing, and ordered the jack to be instantly hauled down, at the same time telling the mate, that if he acted so again without orders, he would punish him for his presumption. Our captain was a hard man, and when he was out of humour, carried it with a high hand, both to his officers and crew.

When we came alongside the wreck, we discerned that the men, five in number, who were clinging to it, were pale and sickly, and seemed as if they had been some days in that situation. It is probable their vessel had suffered in the same tempest from which we ourselves had escaped. They stretched out their hands towards us, and seemed delighted with the prospect of deliverance; and one of them hailed us, and told us they were from Quebec, that their vessel was timber-loaded, and that they were the only survivors of the crew. Our captain replied that he could not take them up, for we had already had a long voyage ourselves, and would soon be on a short allowance of provisions. "But some other vessels are behind," said he, "and will relieve you." The poor man then cried out, earnestly, "O! for the love of God, do not leave us here. We have been waiting for nights and for days, but no ship has come near us, and we are dying of hunger and cold. Our shipmates are all dead, and buried in the waves, and we are alone and helpless on the wide ocean, and we have no one to comfort or save us. O! if ye be men and Christians, have mercy upon us, and do not leave us here!" His companions then raised their voices, and joined their entreaties to his so piteously, that every man in our ship shed tears of sympathy and commiseration except our unfeeling captain. He stood upon the quarter-deck, and looked upon the poor supplicating wretches with coldness and indifference, sometimes humming a tune, and sometimes giving directions to his men, as if he saw not, or heeded not, the scene of misery which lay before him.

The mate then went up to him, and asked whether he would hoist out the boat, but the captain swore that he would not shorten sail, or hoist out his boat, to save all the lubbers that ever stepped between stem and stern. "No! no! Morris," said he, "we have mouths enow already, and we will not have a biscuit a-day to each, by the time we make the Land's-End." The mate, who was a humane man, said, "We have received mercy ourselves, and how can we deny it to others who are our fellow-creatures? Let us save these unhappy men, that we ourselves may be saved in the time of need—for by what measure we mete, it shall be measured unto us again." But this only enraged the captain more. He cursed the mate for a canting scoundrel, and swore if he did not keep quiet, and mind his own business, he would have him started up with a rope's-end. The mate saw it was needless to remonstrate any longer—so he left him, and walked away.

It was mournful to hear the cries of the poor men, when they saw we were deserting them. They cried out, and entreated mercy in such heart-rending accents of distress, as would have moved the compassion of a savage. Greatly did I regret that our crew did not then take the command of the ship into their own hands, and rescue the sufferers—but such was our habitual reverence for our captain, and so much were we lost in astonishment at his strange and inhuman conduct, that we were utterly incapable, at that moment, of acting otherwise than in obedience to his will.

I thank the Father of Goodness, however, that *I* am innocent of the blood of these men;—yet guiltless as I am of the death they endured, their sufferings made a deep impression on my mind; and many a time, still, do I awaken at night, and hear their short thick sobs and piercing screams, as distinctly as if they were uttered at the side of my bed.

They continued to call after us till we were far past them, and their voices were lost in the whistling of the wind. I kept my eyes fixed upon the wreck, where my fellow-creatures were struggling for existence, till the intervening swellings of sea hid it from my sight.

The breeze now freshened, as the darkness of night approached, whereby we were obliged to close-reef our mainsail and topsails, in order that we might be prepared for the worst. It was my turn at the helm that night, and my thoughts often wandered back to the poor wretches we had left behind, and I thought that they must soon perish in the waves, for the sea was now running high and dangerous. The crew had all gone below, except the watch, who were on the forecastle, looking out a-head, and managing the rigging. It was some time past midnight, I think, when I heard the captain bawling as loud as he could, "About ship!" and at the same time he came running towards me, followed by the mate, and taking the wheel out of my hand, turned the ship's head round to the wind in a twinkling. "We must go back," said he to the mate, "and save these poor men on the wreck—I cannot sleep for thinking of them." The mate looked mournfully out to the sea, then shook his head, but remained silent.

As we had now a strong breeze in our teeth, and as our ship was deep, and did not lie near the wind, we beat about for a good while, and made but little of it. A clouded moon shone out upon the sea, and showed it heaving in a strange and tempestuous manner, so that we could not hope that the wreck would hold together for many hours. All this while, the captain walked restlessly about the deck, with his night-glass in his hand, frequently looking out a-head, and appearing to be in great agitation of mind.

"It is going of a fool's errand," said the boatswain, "to seek for these poor fellows. Their last day's cruize is over, I'll warrant them, and all we can do for them now is to hope that they have got into snug and quiet births aloft, in a better harbour than the one they have left here." "Amen!" said the mate. The captain turned away from them, and his feet struck hard against the deck, as he paced it irregularly fore and aft.

It was noon next day ere we reached the place where we conjectured the wreck had been, but not a vestige of it remained. The air was now clear, and the sea stretched far and wide, but nothing was seen to indicate either that the unhappy sufferers still existed, or that they had been entombed in the waves. The mate and some of the more experienced seamen advised that we should forthwith proceed on our voyage, as it was impossible that the wreck could have outlived the tempest of the night; but the captain was now as anxious to save the lives of these poor men as he had before been averse to it. His conscience seemed to reproach him for his inhumanity, and he seemed to feel that he would one day be made to account for the sufferings of his fellow-creatures, which he had refused to compassionate. Even when he acknowledged that there was no hope of meeting with the wreck, still he persisted in the search, and a considerable time was spent before he consented to quit the spot. We beat about for several days, but at length we were obliged, with heavy hearts, to stretch away on our course.

The captain, during the rest of our voyage, seemed much disturbed in his mind. He frequently walked the deck for a whole day without speaking to any one, and seemingly unconscious of every thing around him. Sometimes, too, he was observed to steal out of his cabin at night, and stand at the bows of the vessel, as if watching for a sail, till morning.

After we had arrived in port, and discharged our cargo, I quitted the ship, as did the whole of my comrades—for we liked not to sail any longer with our captain. He, however, in a short time set out again for Jamaica—but he was never afterwards heard of. Some say he foundered at sea, at the very place where he had refused to rescue the poor suffering mariners, and others that his crew mutinied, and ran away with the vessel to the negro coast of Africa. Whatever may have been his fate, it is certain that he never reached the end of his voyage, nor was he once spoke with, or heard of, after leaving this country. Little doubt can remain but that he perished miserably, either on a barren coast, among cruel and relentless savages, or in the bosom of the raging ocean. Herein, therefore, as in many other circumstances of my life, I had reason to thank the goodness of Providence, which had directed me to leave his company, and to seek my fortune elsewhere.

When I had remained some time at home, I engaged myself in quality of mate on board a vessel bound to the Brazils, and made several prosperous voyages to that coast—taking out with me a small stock of merchandise, which turned to very good account.*

HIGH LIFE

IN THE FOURTEENTH CENTURY.

THE domestic manners of European princes and nobles, about five centuries ago, are described with great force, and, we believe, fidelity, in a work published a few years ago, under the title of "Historical Life of Joanna of Sicily, Queen of Naples and Countess of Provence." The following extract will afford some amusement to the rational plebeian of the present day:—

"The domestic manners of the times, and the progress of the useful arts and manufactures, cannot be better illustrated than by a description of the customary arrangements of the apartments of a princess on the birth of a child; and they will, therefore, be here given with a minuteness which might appear frivolous but for this consideration.

These apartments consisted of three rooms in suite—*the chamber of parade*, that of the mother, and that of the infant. The articles of furniture in these rooms were few in number, but splendid in their material. The chamber of parade contained only a buffet with long narrow shelves, of which our modern kitchen dresser is an exact copy in form; a bed never used, except to place the infant upon on the day of baptism; and a single low chair with a cushion, *such as princesses were wont to sit on.*

This chamber, as we may suppose from the name, was adorned with the utmost magnificence the times could boast; it was hung with crimson satin embroidered with gold; the floor was entirely covered with crimson velvet; and the curtains, tester, and coverlet of the bed, corresponded with the hangings of the walls. The single low chair was covered with crimson velvet, and contained a cushion of cloth of gold; a similar cushion lay on the bolster of the bed. The buffet stood under a canopy of crimson cloth of gold; its long narrow shelves were covered with napkins of fine white linen, on which stood flagons, cups, and vases of gold and silver plate.

This apartment, resplendant with crimson and gold, and fine linen, led into that of the mother, which was entirely hung with white figured satin. It is doubtful whether modern luxury could exceed the simple splendour of the one, or the chaste elegance of the other.

This interior apartment contained rather more furniture than the exterior, having two beds, a couch on rollers, a buffet, a small table, and a single high-backed chair. The walls were hung with white figured silk damask; a traversaine or curtain of white figured satin, bordered with silk fringe, hung across the entrance; two others of the same description were festooned up at the upper end of the chamber in the day-time, but, running on rings, were drawn at night, so as to enclose the space which contained the two beds on a line with each other, about five feet apart. These two beds, and the space between, were covered with one tester of white silk damask, with valances of the same white satin and silk fringes as the traversaines, a curtain similar to which was drawn up at the head of the alley between the two beds, under which stood the high-backed chair of state, covered with crimson cloth of gold, with a cushion of the same material. The coverlets of the beds were of ermine, on a ground of violet cloth, which appeared '*three quarters of a yard*' below the ermine all round, and hung down the sides of the bed a yard and half, below which again appeared sheets of fine cambric, starched clear. The couch on rollers was hung and furnished with cushions and coverlets, similar to those of the beds, and commonly stood under a square canopy of crimson cloth of gold, terminating in a point at top. The floor was entirely covered with a carpet of velvet.

But the principal ornament of this apartment was the great buffet which stood under a canopy of crimson cloth of gold, with a border of black velvet embroidered in gold, with the arms of the parents. The number of the shelves of this buffet marked in a conspicuous manner the rank of the parents of the newborn babe. Two were appropriated to the wife of a banneret, three to a countess, four to the consort of a reigning duke or prince, and five to a queen. On these shelves, covered with white napkins, were ranged 'vessels of crystal, garnished with gold and jewels, basins and cups of wrought gold and silver, never used on any other occasion,' and all the most magnificent plate the banneret, count, duke, or king, possessed.

At each end of the buffet stood massy candlesticks of gold, with wax tapers, which were lighted '*when visitors entered*;' two other lights stood before the buffet, and were kept constantly burning, night and day, as, even in summer, the day-light was excluded for fifteen days, in conformity to etiquette. On the buffet were placed three *drageoirs* (confection-boxes) of gold, ornamented with jewels, each rolled in a fine napkin, and at the side stood the low table, on which were placed the gold and silver cups, in which spiced wines were served, after confections had been presented from the buffet.

On common occasions, the office of serving guests was performed by the gallantry of the men; but it was the peculiar privilege of the female sex to dispense the refreshments which were offered to all who entered the natal apartments for the space of a month. When the period arrived for the mother to appear again in public, she was placed at the side of the bed in the chamber of ceremony, habited in her most sumptuous robes, and was conducted by princes and knights to the church, preceded by minstrels and trumpets, as when espoused. At the altar she presented three gifts borne by three noble ladies of her suite—a candle, with a piece of gold inclosed, a loaf of bread rolled up in a napkin, and a cup filled with wine. The attendant ladies kissed these offerings as they delivered them to the princess, and she kissed the patina each time the priest presented it to receive them, it being esteemed a mark of respect to kiss whatever was presented to a superior. When the ceremony was finished, she was reconducted to the palace in the same state.

The various gradations of rank on such occasioon were marked in the middle ages by a variety of minute circumstances. A countess, for instance, could have but *three shelves* in her buffet, on which she might place but *two* confection-boxes. The hangings of her apartments could not be hung with satin or damask, but she was obliged to be contented with silk of an inferior quality, tapestry, or embroidery on silk. These regulations show how various must have been the products of the loom, when tapestry and embroidery in silk were assigned to the inferior ranks. The coverlet of a countess was of *menu vair* (that is, petit gris) in lieu of ermine, and the lining might only appear beneath the fur *half a yard*, whilst an additional quarter marked the royal rank. The canopy of her buffet must consist of velvet, not of cloth of gold, and must not be bordered with a different colour or texture.

A considerable degree of magnificence began now to distinguish the interior ornaments of the residences of the great, especially in the south of Europe. The walls were hung with velvet, satin, or damask, or painted in a regular series of stories from Scripture, or from the innumerable romances then in vogue, and the windows were frequently glazed with that brilliant painted glass which modern art has vainly endeavoured to emulate.

Whilst the walls of palaces were thus sumptuously decorated, the floors were generally neglected. When carpets were used, they were of silk or velvet, corresponding with the hangings; but these were rare, and spread partially, in the oriental fashion, for the comfort of individuals of rank. The brick or marble floors were generally strewed (at least in summer) with rushes or odoriferous herbs, or the flower of the yellow broom when in season, which thence became the emblem of humility.* Vases of flowers were also a favourite ornament of both their eating and sleeping apartments.

But the chief magnificence of the great was displayed in their own personal attire, which, varying in fashion from day to day, and differing in every different capital, may be described as ludicrous or splendid according to the scene or occasion chosen.

Offices that we should deem a degradation to any above the rank of a menial servant, were, in the middle ages, performed by youths of the highest birth, whilst serving as squires, preparatory to their receiving the order of knighthood, without which no rank conferred the privileges of honour.

The young squires spread the tables for the guests, and when the knights and ladies retired from the festive board, after eating their own meal, they cleared the hall for dancing, or some other general amusement in which they were permitted to join. They arranged the sleeping apartments of their lords, and their male guests; made their beds, and attended them to their chambers after having served them with *the wines* and confections which were understood to be the signal of separation. *The wines*, as this evening cordial was called, was a mixed beverage, compounded of wine, spices, and honey, according to the ingredients called *claret*, *hypocras*, or *pimento*.

From the offices assigned to the highborn squire, we may conclude that female servants were rare in the feudal castle, and seldom employed except in the apartments of ladies: princesses were personally served by women of rank.

They must not be served at table by a gentleman with a napkin on his shoulder, but only one round his arm. Their bread is not to be put in a napkin folded up on the table, but only laid on the table with the knives, and covered with an unfolded napkin. Their seneschal is not to carry a wand of office, nor are they to have two cloths at once on their tables, nor are the trains of their robes to be borne by *women*, but only by some gentleman or page; nor are they to have gentlemen or horses without number, but only as many as their rank permits.

The chief luxury of the table was the intermeats, which on common occasions were delicate dishes, such as *blanc-manger*, omelets, and, in Italy, maccaroni. But at public banquets, by the intermeats were under-

* From the *Literary Coronal* for 1823.

* The Earl of Anjou, grandfather to Henry the Second of England, bore the broom-branch in his penitential pilgrimage to the Holy Land: hence the name of Plantagenet, from the *Planta genista*, descended to our kings.

stood certain entertainments and pageants, introduced in the hall between the courses, for the amusement of the guests. Representations of battles and sieges were performed, allegorical personages introduced, and minstrels, dancers, tumblers, and jugglers, vied with each other in exercising their talents for the amusement of the assembly. Besides the common exhibitions of licking red-hot iron, keeping up four or five knives or balls in the air at once, catching a lance on the nose, or balancing timbrels on the ends of the fingers, the jugglers seem also to have occasionally practised optical deceptions.

At public festivals, dancing generally succeeded to the banquet. All the dances of this period seem to have been of slow measure, so that the customary expression of holding a *solemn ball* was more appropriate than it at first sounds.

In private society, singing, playing on some musical instrument, and the art of narrating stories of mirthful or romantic adventure, were accomplishments commonly possessed by the youth of both sexes in southern Europe. No less than forty ways of playing chess are said to have been known. Backgammon, under the ancient name of *tables*, and many other games of chance, were much practised, and towards the close of this century cards were invented at Paris.

These were the amusements of the hall or chamber; the more active sports of the young squires and pages were quoits, ball, prison-bars, or the game of base; shooting at the popinjay, hazel wand or rose garland, and tilting with hollow canes."

DEESIDE.

THE sun has not yet cast off his winter mantle of haze and cloud;* the trees have not assumed their dress of green; the grass is still stunted and brown; the more genial flowers of spring have not been prevailed on to peep from the coverings of their sombre buds; and every now and then a cold shivering blast comes whirling from the bleak white hills, or from the surly sea—it is assuredly hardly the time for a pleasure jaunt, especially in the case of busy people like ourselves, who are not partial to perusing the North British Advertiser three weeks old, or Pigot's Commercial Directory for 1826, in a dirty room of a country inn, with a grate before us which has not the faculty either to give light out of smoke, nor smoke out of light, but to give smoke alone, without a blink of fire, a window which gives a view of a dead wall opposite, too close to admit the passage of light, but not too close to prevent the passage of the sputtering sleet, which finds its way through the chinks with every cold sweep of the scouring wind. Yet it is, after all, spring—at least spring by courtesy, if not in fact—the birds will soon begin their songs—the sun will look clear, the sky blue, the waters of the frith unruffled—the trees will assume a tender green—people will begin to long after a ramble in the woods, and will hardly know where to go: out of common charity we should inform them; and so, with our feet on the hobs, and the candle burning brightly in a cold evening, we shall take a mental excursion to the hills, whither we expect our reader's kind company for a few minutes. We are to be far north this time; so we shall commence by setting our friend down at the point of the new pier of Aberdeen, whither, if he is fond of a brisk sea-breeze, and a fine line of coast scenery, he has found his way in the steam-boat. On first landing, the traveller will find a dreary line of wharf and dock, thousands of ships, and all the glories of commerce expanded before him. "Footdee" and "the Shore" may not be considered by him as among the most inviting of places, but let him not form hasty and rash conclusions of the spot on which nature has chosen to let him drop. Aberdeen is, to be sure, an odd sort of place in many respects—a place which has ways of its own, which strangers sometimes make wry faces at—but it is, nevertheless, an excellent place, and only requires to be well known, to be well appreciated. We advise you then by all means to remain where you are for twenty-four hours at least, and acquire, by converse with the crowded city, additional zest for a ramble among the lonely hills. You will surely find some worthy acquaintance on whom you may bestow the pleasure of your company; and if you do not, you will at least find one or two of those hospitable mansions, called inns, where the stranger and wayfaring man are received and tended. Presuming you to be mounted on an eminence, from which you can take a view of the busy city, swarming and toiling beneath your feet, and of the neighbouring land and sea, you will find an aspect of scenery, which, if not beautiful, is at least peculiar and interesting. Here a vast tract of country has in a manner stretched its hard edges into the German Ocean, embracing its balmy north-east wind, and hugging the foam of its waves, and its generous fogs, as if Britain had set aside this the sturdiest and toughest portion of her soil, to keep the tender mercies of the ocean from her green grassy hills and fertile vallies. But if the interest which the scene inspires may be of a questionable nature, no one will withhold a modicum of admiration to the men *(justly called so)* of the spot, whose minds have been fashioned after the manner of the country. There is, indeed, a sturdiness and toughness about every thing Aberdonian, which forms a connecting link between the mind and matter of the district. There is the cold, hard, white granite, stretching in long perspective by the sides of the well-built and well-filled streets—the hard bleak outlines of the hills—the stiff sea-breezes, and stiffer double tumblers and Finnan haddocks, and the bold broad accent; and, in conformity to these, are the shrewd clear intellects, acute as the east wind after it has sharpened itself on the surface of the German Ocean, the minds made for mirth and glee, and the sound heads, which the double tumblers aforesaid cannot discompose. Recollect that this bleak out-o'-the-way place has numbered among its citizens a Barbour, a Jamieson, a Gibbs, a Gerard, a Blackwell, a Gregory, a Campbell, and a Beattie—names whose sound is somewhat hard, and in conformity with their intellects, which could deal weighty knocks to people of a softer clime. We expect you will take an after-dinner saunter through the cloistered pile of King's College, where you will hear your tread echoed along the Gothic curtains, and see wall-flowers and ivy growing in carved niches, beautiful in hoary antiquity, but not in decay. A while ago you might have heard the hum of many voices within, and seen the "Gentlemen of the University" issuing from the great arched gate, with their scarlet gowns; but now the session is up, and nothing disturbs the repose of the evening, save the ticking of the clock, the songs of a few blackbirds in the trees, and the steps of the venerable sacrist, who wanders like a spectre about the deserted halls, finding his occupation gone; nor must you omit some admiration to the gloomy grandeur of the neighbouring cathedrals, or to that surly arch of Balgownie, commemorated in the history of the early days of Byron.

We shall take the liberty of presuming that you are in one of the Deeside coaches next morning, with the early lark singing matins over your head, "the ploughboy whistling o'er the lea," and the sturdy labourer proceeding to his morning work, and you doubtless feel delighted with the pure spring air, the clear streams, and the green trees, around you. Perhaps a good breakfast, with plenty of heather honey, may have made you alive to the beauties of nature ere you have reached Upper Banchory—it is really a very sweet spot: the Grampians circle it round, and their tops are probably just now, even in these less alpine parts, covered with snow. On the left you will perceive Cloch-na-ben, with a curious wart on her forehead; and far off you may distinguish the graceful outline of Lochin-y-Gair. The Dee has here a deeper, mellower hue than any where else; the trees cast a softer shade; the hills are more green; and then there is a clattering brook, which rattles itself into some black pool at the foot of a rock, forming itself into a torrent more wild than a regular cascade, near which a pretty cottage, half hid in trees, peeps over the top of a rock into the restless surge; and at a distance, to complete the prospect, is seen the village church with its Gothic tower. As the traveller proceeds on his journey, he has now a pleasing variety of scene—the road sometimes passes through deep shady woods, where the tender birch is the pervading tree—then it emerges, and winds round the edge of some elevated terrace, with the Dee brawling beneath, or winding calm and smooth through some tranquil valley, where its waters are allowed a moment of dignified peace; nor should we forget the venerable towers frowning over smooth knolls of green trees, which refinement and good government have converted into mere ornaments of the soil. When you are about thirty miles or so from Aberdeen, the scene changes considerably. The Moor of Dinnet is a wide monotonous expanse of some square miles; little does it contain but heather, and bogs, and cairns. So, wishing our friend a good journey across it, we shall just amuse them with a sketch of the character of the men of Deeside. They are a sturdy, independent sort of people, with many customs which their wellwishers would not choose to see atered. They have much honesty, and great civility, although few strangers allow them the latter qualification on a first interview, from a simplicity and appearance of conscious equality in their manner, which those accustomed to obsequiousness are apt to call insolence. It is remarked, that they do not touch their hatwhen speaking to an individual with a good coat, and they never vouchsafe the term "your honour," or even the less respectful "Sir." In courts of justice their manner is strikingly remarkable. The man from the hills stands bolt upright, giving no farther honour to the august assembly than merely taking off his hat, which is not unfrequently done for him by the officious attendant, and telling his story blunt through, without vouchsafing any man his title; nor does the hard rough sound of the honest man's voice, or his proverbially broad pronunciation, mitigate the effect. They live healthily, but coarsely; indulging their iron frames moderately in the strong waters of the district. Their habitations are not proverbial for comfort or cleanliness, nor are they fastidious in insisting, as many other people do, that smoke shall find its way out, and that rain and snow shall not find their way in. It is related (though perhaps the story is an exaggeration), that two or three young gentlemen from Aberdeen, having encountered on the Moor of Dinnet such a pleasing coincidence of circumstances as a cold dark night and a pelting highland shower, sought refuge in the nearest cabin. The usual hospitality of the district was offered to the unfortunate pedestrians, and they ensconced themselves for the night in one of the sleeping apartments: the term *one* is not so inapplicable as it may seem, for a highland farm-house has divers buildings about it, which may be used as bed-rooms for any description of animal under the sun, not excepting a man. The rain continued all night: on wakening in the morning, though the place was dark, the gentlemen found it was time to rise; so one of them stretched his leg cautiously out of bed, but the limb retreated to its resting-place with considerable celerity, when it found itself encountering the cold surface of a sheet of water. The other gentleman was not so fortunate: he jumped right out, and found himself up to the knees in water. It was useless to be deterred; so he searched about for his clothes, which he caught hither and thither, not in the condition he could have wished to have found them in, and, getting them on as well as he could, went straightway to tell his moving accident by flood to his hospitable hostess; but the only consolation he met in that quarter was a stare of contemptuous astonishment, and this sententious remark, "Dinna tell me ony mair about it, man; ye should just hae lookit about ye for the stappin' stanes."—But our friends have, ere this time, reached Ballater, the Tunbridge Wells of Aberdeen; it is a fair village, built on a small plain, with a precipitous hill behind, and before it the winding Dee, once crossed by a stately stone bridge, of which the merciless floods of 1829 have left nothing but a scattered heap of stones remaining. After passing Ballater, the stranger is in the bosom of the Grampians; previously he has passed hills of no contemptible dimensions, and seen hills still higher rising before him, but he always found an outlet which allowed his eyes to wander down some fruitful vale, till it lost its gentle outline in the distance. Now he is surrounded and barricadoed in by hills; wherever he may worm his way through the vallies, they surround him like a wall, which forbids his escape; some crowned with pine, others raising their bare bleak tops among the clouds. But the glens through which he wanders are still full of trees and verdure; first he passes the Tower of Abergeldie, embosomed in its well-known bowers of weeping birch; then he is among the forests of Braemar, those tall proud pines, not planted by the hand of man, but the legitimate grandchildren of the ancient forests, which sheltered the foes of the Cæsars. Far above its companions, Lochin-y-Gair stretches its broad black precipices, streaked with snows, which thousands of summer suns have not melted. Nor are the inferior heights which overhang the pathway to be neglected. It is probable that the stranger may have seen many a round-topped craggy hill like Arthur Seat, or some set of sheer precipices on the sea-shore, but that he may never have seen a rock rising some thousand feet or so to a sharp point, with its sides partly bare and precipitous, partly shagged with trees. Let him then stand and gaze at the Cluny Rock, which hangs its beetling point over the public way, as if it were watching an opportunity to discharge its head at some illustrious and chosen passenger, as Faudon served Wallace. But we have now brought our courteous reader to the village of Castleton of Braemar, which will probably be his journey's end for a time; and as he will require rest and refreshment before he accompanies us to the recesses of the far-off mountains, we are sure Mr Emslie of the Fife Arms will be exceedingly glad to see him, will have no objections to his staying all next day, and be the last person in the world to make any grumbling or inhospitable observations on his sojourn, however long.

BIOGRAPHIC SKETCHES.

WILLIAM EDWARDS.

AMONG the various instructive examples of the triumphs of genius over difficulties, afforded in the lives of numerous distinguished individuals, that of William Edwards, a celebrated engineer of the last century, is particularly worthy of notice. This ingenious man was a native of Glamorganshire, in Wales, where he was born in the year 1719. He had the misfortune to lose his father, who was a farmer, when he was only two years old; but his mother continued to hold the farm, and was, in this manner, enabled to bring up her family, consisting of two other sons and a daughter, besides William, who was the youngest. Her other sons, indeed, were soon old enough to take the chief part of her charge from her hands. William was taught, in the mean time, to read and write Welsh; and this was all the education which he seems to have received. When about the age of fifteen, he first began to employ himself in repairing the stone fences on the farm; and in this humble species of masonry he soon acquired uncommon expertness. The excellent work he made, and the dispatch with which he finished it, at last attracted the notice of the neighbouring farmers; and they advised his brothers to keep him at this business, and to let him employ his skill, when wanted, on other farms, as well as their own. After this he was for some time constantly engaged, and he regularly added his earnings to the common stock stock of the family.

Hitherto the only sort of building which he had practised, or had seen practised, was merely stone-masonry without mortar; but at length it happened

that some masons came to the parish to erect a shed, for shoeing horses, near a smith's shop. William contemplated the operations of these architects with the liveliest interest, and he used to stand by them for hours while they were at work, taking note of every movement which they made. A circumstance which at once struck him, was, that they used a different description of hammer from what he had been accustomed to employ, and, perceiving its superiority, he immediately procured one of the same kind for himself. With this he found he could build his walls both more rapidly and more neatly than he had been wont to do. But it was not long after he had, for the first time in his life, an opportunity of seeing how houses were erected, that he undertook to build one himself. It was a workshop for a neighbour, and he performed his task in such a manner as gained him great applause. Very soon after this, he was employed to erect a mill, by which he still further increased his reputation. He was now accounted the best workman in that part of the country, and being highly esteemed for integrity and fidelity to his engagements, as well as for his skill, he had as much employment in his line of a common builder as he could undertake. In his twenty-seventh year, however, he was induced to engage in an enterprise of a much more difficult and important character than anything which he had hitherto attempted. Through his native parish runs a river called the Taff, which flows into the estuary of the Severn. It was proposed to throw a bridge over this river at a particular spot, where it crossed the line of an intended road; but to this design difficulties of a somewhat formidable nature presented themselves, owing both to the great breadth of the water, and the frequent swellings to which it was subject. Mountains, covered with wood, rose to a considerable height from both its banks, which first attracted and detained every approaching cloud, and then sent down its contents in torrents into the rvier. Edwards, however, undertook the task of constructing the proposed bridge, though it was the first work of the kind in which he had ever engaged. Accordingly, in the year 1746, he set to work, and, in due time, completed a very light and elegant bridge, of three arches, which, notwithstanding that it was the work of both an entirely self-taught, and an equally untravelled artist, was acknowledged to be superior to anything of the kind in Wales. So far his success had been as perfect as anything which could be desired. But his undertaking was far from being yet finished. He had, both through himself and his friends, given security that the work should stand for seven years, and for the first two years and a half of this term, all went on well. There then occurred a flood of extraordinary magnitude; not only the torrents came down from the mountains in their accustomed channels, but they brought along with them trees of the largest size, which they had torn up by the roots; and these, detained as they floated along by the middle piers of the new bridge, formed a dam there: the waters, accumulating behind, at length burst from their confinement, and swept away the whole structure. This was no light misfortune in every way to poor Edwards; but he did not suffer himself to be disheartened by it, and he immediately proceeded, as his contract bound him to do, to the erection of another bridge. He now determined, however, to span the whole width of the river, by a single arch of the unexampled magnitude of one hundred and forty feet from pier to pier. He finished the erection of this stupendous arch in 1751, and had only to add the parapets, when he was doomed once more to behold his bridge sink into the water over which he had raised it, the extraordinary weight of the masonry having forced up the key-stones, and, of course, at once deprived the arch of what sustained its equipoise. Heavy as was this second disappointment to the hopes of the young architect, it did not shake his courage any more than the former had done. The reconstruction of his bridge, for the third time, was immediately begun with unabated spirit and confidence. Still determined to adhere to his last plan of a single arch, he had now thought of an ingenious contrivance for diminishing the enormous weight which had formerly forced the keystone out of its place. In each of the large masses of masonry, called the *haunches* of the bridge, being the parts immediately above the two extremities of the arch, he opened three cylindrical holes, which not only relieved the central part of the structure from all over-pressure, but greatly improved its general appearance in point of lightness and elegance. This bridge was finished in 1755—the whole undertaking having occupied the architect about nine years in all—and it has stood ever since.

This bridge, at the time of its erection, was the largest stone arch known to exist in the world. Since that time, stone arches of extraordinary dimensions have been built—such as the five arches composing the splendid Pont de Neuilly over the Seine, near Paris, the span of each of which is a hundred and twenty-eight feet—the island bridge over the Liffey, near Dublin, which is a single arch of a hundred and six feet in width—the bridge over the Tees, at Winston, in Yorkshire, which is also a single arch of a hundred and eight feet nine inches in width, and which was built by John Johnson, a common mason, at a cost of only five hundred pounds—and the nine elliptical arches, each of a hundred and twenty feet span, forming the magnificent Waterloo Bridge, over the Thames, at London. A bridge is now building at Chester, which is the largest single arch in the world, being two hundred feet span.

At Bishop-Wearmouth, in the county of Durham, there is a *cast iron* bridge, over the river Wear, the chord of the arch of which is two hundred and forty feet long. The Southwark or Trafalgar Bridge, over the Thames at London, is at present the finest iron bridge in the world. It consists of three arches. The chord of the middle arch is two hundred and forty feet long. There is a *timber* bridge over the Delaware, near Trenton, in New Jersey, which is the segment of a circle three hundred and forty-five feet in diameter. The timber bridge over the Schuylkill, at Philadelphia, is of the extraordinary span of three hundred and forty feet. The bridge over the Piscataqua, near Portsmouth, New Hampshire, is the segment of a circle six hundred feet in diameter.

The bridge built by Edwards over the Taff, buttressed as it is at each extremity by lofty mountains, while the water flows in full tide beneath it, at the distance of thirty-five feet, presents an aspect very striking and magnificent.

This bridge spread the fame of Edwards over all the country. He afterwards built many bridges in South Wales, having their arches formed of segments of much larger circles, and consequently much more convenient. He found his way to this improvement entirely by his own experience and sagacity; as, indeed, he may be said to have done in regard to all the knowledge which he possessed in his art. Even his principles of common masonry, he used himself to declare, he had learned chiefly from his studies among the ruins of an old Gothic castle in his native parish.

Edwards was likewise a farmer to the end of his days. Such, moreover, was his unwearied activity, that, not satisfied with his week-day labours in these two capacities, he also officiated on the Sabbath as pastor to an Independent congregation, having been regularly ordained to that office when he was about thirty years of age, and holding it till his death. He accepted the usual salary from his congregation, considering it right that they should support their minister; but, instead of putting the money into his own pocket, he returned it all, and often much more, in charity to the poor. He always preached in Welsh, though early in life he had made himself acquainted with the English language, having acquired it under the tuition of a blind old schoolmaster, in whose house he once lodged for a short time, while doing some work at the county town of Cardiff. In this effort he showed all his characteristic assiduity.

Edwards died in the year 1789, in the 70th year of his age, leaving a son, who inherited his abilities.*

REMINISCENCES OF MY TRAVELS.

THE readers of these outlines of my travels (which, by the way, I "intend" shall shortly make their appearance, according to custom, in two volumes octavo, with coloured engravings, price four-and-twenty shillings) will be pleased to remember, that I left off by mentioning how I had the temerity to embark on board of a vessel bound for certain territories as yet unknown, and which, therefore, remained to be described to the world.

Passing along the coasts, I observed them partially covered with rushes, and other aquatic plants. The captain informed me he had never seen any crocodiles lurking along shore, although I plainly perceived, beneath a kind of lotus, something very like the trunk of a tree. I occasionally threw pieces of biscuit over board, to ascertain if any of the shark species were alongside, but I saw none: something shot past us with the velocity of lightning: I know not if it were a porpoise. I was anxious to see the Argonautus spread its little sail, as the weather was moderate, but I was not so fortunate; yet, while looking out far a-head, I saw what I imagined to be a flying-fish, and entreated the captain to permit me to go forward and spear the dolphins as they came up in pursuit of their winged prey. He informed me I need not take any farther trouble, for, if I had seen a flying-fish, the dolphin would undoubtedly come on board. This I thought delightful, and I described to Tim the variety of brilliant hues that extraordinary fish displays while gasping for breath; but it came not on board: I therefore conclude the other was not a flying-fish.

The port at which we embarked lessened on my view, till it became doubtful where it was; we were not out of soundings I was certain, for several flights of birds, about the size of Mother Carey's chickens, and perfectly black, hovered about. By the noise they made, I should conclude them to be voracious. I knew there were arms on board, consequently did not experience any alarm, but they passed without offering us any molestation. I surveyed the coasts as we stretched along them with all sail set, but saw neither palm tree, date tree, bread-fruit tree, nor pines, nor melons, nor oranges, growing wild. I thought there appeared something tinged with red on a bank, and I inquired of the captain if it were a bird of the crane species, called an adjutant? I was informed it was only a private of the guards. As we proceeded, the headlands had all the appearance of being inhabited, and, as we neared shore, I perceived dwellings, about which the natives were actively employed. I distinctly saw what I believed to be a female with a vase, formed with a handle on one side, and a spout on the other. I did not think it prudent to alarm her, as she sat still to observe us, perfectly motionless. I asked the captain if he thought it could be a mermaid. He believed not. Tim looked very intently, but could not see either a glass or a comb, and I feel I should not be justified in stating it to be a mermaid, for I had no opportunity to see its tail.

Again we stood out, and I was enabled to turn my attention to scientific inquiries. The specific gravity of the water of the Dead Sea exceeds other water; it is stated that persons can float there with ease, who would undoubtedly sink elsewhere; but such is the obstinacy of man, that nothing I could urge to Tim could induce him to jump overboard to ascertain the properties of these waters. I had also a strong desire to know if it were fresher at the bottom than on the surface; the captain furnished me with a small phial, but Tim could not be prevailed on to be lowered, with a weight attached to his body, to determine any valuable addition to modern discoveries. On directing my attention to the distance, I thought I perceived something moving, and pointed it out to the captain, who assured me it was stationary; I looked again, but could not see any paper-like appearance. He overlooked me as I endeavoured to take a sketch, and I heard him mutter, "Star and Garter." I closed my sketch-book, and ran over the celestial hemisphere in my mind's eye. I did not think it a constellation of Chaldeic origin. I was observed divining, but I gave up the idea of being deemed a conjuror, by inquiring where the Star and Garter was situated. "On Richmond Hill," replied the captain. At that moment I made the discovery that it was affixed to the earth; of course, the agreement thus scientifically made by two individuals, and by a different process, will render it one of those results that may be deemed indisputable. As we approached, the beauty of the scenery was pointed out to me; it is such as Arcadia alone could give to the eye of a traveller. On every tack, the prospect grew more delightful, the distant objects more beautiful, the nearer more lovely. The sun was glancing on richly scattered foliage that decorated the villas on various parts of the gently sloping ground. The trees seemed like the lashes on the eyelids of beauty, to shield the gems that shone beneath. If ever there should be another Eden, it will be laid out like Richmond. It was a presentiment that caused me to search for this spot in the celestial regions. I was enchanted, but the captain hastened from the scene as if a Circe were there. I must think there are syrens on the shore, but the captain had more fortitude than Ulysses, who bound himself to the mast, and was frightened out of his wits by Scylla and Charybdis. No such fancies entered the head of my captain. I therefore consider him a greater man.

The wind increased, and dense clouds began to roll their huge masses towards us. The spray beat over the deck, and wet the whistle of the gusts in the cordage. The mountain wave, and the dreadful gale, are mole-hill and sigh compared to what I experienced as our vessel rolled and pitched. Can weathering the Cape equal this? It is monsoon and tornado united. I could scarcely stand on deck, and could not go below. I gazed on the conflicting elements, and thought of Vandeveldt's going to sea purposely to witness a storm, who, while amid the roar of the winds, and the foam of the waves, exclaimed, "Grand! Beautiful!! Sublime!!!" If he had been with me, his mind would have been otherwise employed. I verily believe there to be a state of mind, produced by an accumulation of *things*, in which it is deprived of the power of judging correctly. Tim was quite overcome—perfectly prostrate: I therefore became watchful for his safety. I thought him too near the side, and endeavoured to drag him into a place less dangerous; my earnestness alarmed him, and as I put forth all my strength for his preservation, my foot slipped, and Tim unfortunately fell overboard—I retained my hold of him until I was assisted by the captain: we fished him up, and were glad to find he was not wetted through the skin, nor a leg snapped off by a shark. I was quite delighted with his philosophy, as he calmly looked round and said, "I dare say all's right." The vessel continued to labour; her timbers creaked as she rose on the wave, and groaned as she dipped into the hollow; yet I was not subdued by fears that lessen exertion, for I ascertained our supplies were deficient—that we had no life-boat, not even a cork jacket on board, nor means by which to fire a rope ashore. With the knowledge of all these distressing particulars, I was still enabled to retain self-possession, which proves that travellers should be peculiarly gifted, both physically and mentally, to secure themselves against the multitudinous disasters by which they are surrounded. I inquired of the captain if I could be put on shore? "Where?" said he. "There," said I, pointing to an open beach. With pleasure I saw the bow turn shoreward, and heard with satisfaction the keel grate upon the beach. I leaped on shore with alacrity, which Tim, endeavouring to imitate, measured his length rather inelegantly: he might, however, have been saluting the earth at their meeting again. "Adieu!" said I to the captain. The vessel lessened on my view, and mingled with the mist. As my eye glanced along the shore, I perceived two of the natives coming towards us. "Where are we?" said I to Tim—

* Biography of Self-Taught Men. Boston, 1831.

"Here, sir," said he, "and there go two other travellers; thank God, they do not come our way." Tim trembled exceedingly. "Don't be terrified," said I, "but let us proceed up the country."

I traversed various tracts of land in different stages of preparation; occasionally they were intersected by small water-courses, or plantations of a species of thorn, and some were planted with esculent vegetables in a high state of cultivation. I saw nothing that could satisfy me. I was in a beaten track; all was silent and solemn. How interesting are periods of uncertainty! Every step seems as if poetically taken, and the imagination capable of being excited, even to the sublime; nay, even beyond.

At the extremity of one of these ranges of the country I perceived a trodden way; at least I so concluded, from the vegetation appearing as if destroyed by pressure and friction, most probably from the feet of natives. I pursued this apparent pathway until I approached the confines of a forest, the extent of which I had no means of ascertaining. It might be what is denominated a wood only; at all events, there were some trees. However, on looking to the left, I was surprised at beholding what might be considered a habitation. I approached with some trepidation, and, to my astonishment, saw a tablet of a peculiar description. "Here," said I "my toil meets its merited reward." No one to give information, I was driven on my own resources; fortunately they were vast, or darkness would have hung on this subject, perhaps for ages, or till some highly-gifted traveller should, like myself, wander to the spot. My delight at the discovery subdued, for a moment, all other sensations. I drew out my sketch-book. The tablet was a parallelogram, fourteen and a half inches high by eleven inches one-tenth and a line broad. Now, it does not appear that the tablets of the Ethiopians were exactly of these dimensions, and it is singular precisely in the degree in which it may differ. This tablet, which, for the future, and for distinction, should be denominated mine, was covered with a composition of a black colour, or near that hue which is occasioned by the absence of light. The characters which embellished this tablet were of a colour approaching to white; but as the composition was not equally opaque, the hue of the groundwork appeared more or less through the transparent parts, thereby giving a great variety of grey to different portions of the characters without the appearance of design. How far time may have been instrumental to this curious arrangement, it would be difficult, perhaps presumptuous, in me to determine. The inconceivable delicacy and beauty which antiquity infuses, and which few of the moderns sufficiently appreciate, are beyond the reach of art, but regulated by antiquarian procedure, and perfected by mental acquirements. The characters which appear on this tablet in three lines, are copied with all the attention to correctness of form that an admirer could bestow; but it is hoped due allowance will be made, when the very limited means the moderns possess shall be taken into consideration.

MANGL
IN DUN
HEAR

When this beautiful specimen of antiquity first met my astonished eyes, the impression on my mind was correspondingly alarming, and it is surprising that I was enabled to pursue the investigation on the spot, as I did, with such critical acumen and indisputable correctness; but I knew too well the value attached to faithful delineation and just examination of objects connected with bygone ages, to permit my intention to be thwarted. After the agitation had subsided, I commenced by tracing a similarity to the Roman character with some resemblance to the Saxon; apparently the whole formed a sentence consisting of four words; but not being satisfied that beginning at the right end would succeed best, I very naturally sought for a part at which I could commence. Thus it was that the final word pressed itself on my mind, being precisely the English word "hear," from the Saxon *hynan*, a verb active. I could not discover in what mood; but it is rational to conclude that information was intended, and, therefore, that it is in the imperative. It also appeared to me that the second or the middle line contained two English words, "IN," a Latin preposition, and an English adverb. This, in connection with the foregoing word, I could comprehend as *herein*, or *in here*, making those allowances which, to the study of inscriptions, are absolutely necessary. The characters of the first line for a long time were inexplicable. It was possible, I thought, that they had been altered by other hands than time; and that, penetrating the mists of ages, and correcting the false orthography of sculptors of inscriptions, the characters MANGL might be from the French, *manger*, to eat. If so, it would justify the horror I felt at the first. *Manger!* The anthropophagi rushed powerfully on my mind; but it is not an affection of the nerves that can drive a true antiquarian traveller from his pursuit. The word might be from the English, or rather Dutch, *mangelen*, to tear, to lacerate, to rend piecemeal! This was in effect appalling; it seemed that nothing short of violent extermination awaited me; but I was not to be subjected thus to terrors; they were all defied; for an opportunity had occurred to distinguish myself. I had put my life upon a cast, and I would stand the hazard of the die. I stood firm. "Hear dun in mangl;" what dreadful words! What information of a horrid practice! Druidical perhaps! They immolated human beings; so did the Peruvians, the Mexicans, and it is impossible to say how many others. My contemplations were broken by a contest betwen Tim and two of the natives, the same I had seen on my landing. They got the better of Tim, and put irons on his wrists. In answer to my inquiries, I learned that Tim had made his escape from the cage at Hampton, where he had been confined for gathering some fruit from trees that did not belong to him, and that if I made any resistance to his being taken, they would handcuff me also. To which I replied, "Farewell, Tim," and away they went. The confusion brought forward the inhabitants of the horrid cavern—they were females. I gazed with astonishment: "Pray," said I, "what is to be understood from that tablet against your dwelling?" "Why, can't you read? I take in washing and mangling." I looked at the woman, then at the tablet, then at my book. "Umph," said I, "I did not know that, but it is never too late to learn." "To learn!" exclaimed the woman; "what are you, then?" "A gentleman, a traveller, and an antiquarian," replied I; adding, "I have discovered what you are. In my opinion, you are an exceedingly rude being." "Well," continued the woman, "and, in my opinion, you are a great fool." To this nothing could be said, and I retired, thinking on the probability of its correctness.

CURIOUS FACTS REGARDING VEGETABLE REPRODUCTION.

It has long been known that crows, and other birds and animals, deposit seeds in the earth, from whence trees and plants are produced. The Rev. Mr Robinson, in his Natural History of Westmoreland and Cumberland, says, that "birds are natural planters of all sorts of trees, disseminating the kernels upon the earth, till they grow up to their natural strength and perfection." He tells us, "that early one morning he observed a great number of crows very busy at their work, upon a declining ground of a mossy surface, and that he went out of his way on purpose to view their labour. He then found that they were planting a grove of oaks. The manner of their planting was this: They first made little holes in the earth with their bills, going about and about till the hole was deep enough, and then they dropped in the acorn, and covered it with earth and moss. The young plantation," Mr Robinson adds, "is now growing up to a thick grove of oaks fit for use, and of height for the crows to build their nests in. On telling the circumstance to the owner of the ground, who observed the acorns to spring up, he took care to secure their growth and rising. The season was the latter end of autumn, when all seeds are fully ripe."

It is surprising how many different means nature adopts in perpetuating the duration of animal and vegetable life. Mr Edwards justly remarks, that even the droughts of autumn continue to increase and propagate seeds and plants. These sudden and long-continued droughts occasion deep chinks and cracks in the earth, wherein are deposited the seeds of trees, and the larger plants that require depth for their growth, and are at the same time placed beyond the reach of animals which feed on them.

The seeds of the common broom grow in little pods, which, when fully ripe, and ready for diffusion, are scattered by a beautiful contrivance of the contraction of the edges of the pods, which suddenly bursts them open, and, forcing the internal surface outward, throws the seeds at a considerable distance from the parent plant. But for this wise provision, they would be choked under the old plant for want of air and light.

Mice also bury a great number of seeds for their winter store, many of which vegetate.

Some seeds, such as those of the thistle, are provided with a kind of down, by which, as with wings, they are carried, with the help of the wind, to great distances, and others fix themselves on the ground by means of glutinous substances attached to them.

The South Sea Islands, which have been raised to their present elevation above the ocean, are entirely the production of myriads of minute polypi or worms, which construct the different kinds of coral. These coral formations are first covered by sand, and then by marine substances; then with the excrements of birds, in which are undigested seeds, that spring up and flourish in the deposits which have been formed on the reefs.

Some plants are migratory, while others are fixed to particular localities, from which they never wander. In Hampton Court Park, there is a small pink, which inhabits a particular mound of earth; and although it has long been known on that spot, yet it has never extended beyond it.

It is curious to observe the influence which particular soils have on different flowers. Whoever has attended to the cultivation of tulips, must have noticed, that, by planting them on too rich a soil, the colours will spread; and others, which have steadily remained of one colour in some particular soil, will, on being removed to another, break into a variety of colours. If the common field primrose is taken up, and the root separated, and planted in another soil, the blossom loses its brilliant yellow hue, and becomes of a pale brown or chocolate colour.

Perhaps one of the most extraordinary phenomena connected with vegetable life, is the tendency of plants to follow light, which seems so necessary to their health, and even their existence. This makes them display what Blumenbach calls real motion. In the Memoirs of the American Academy of Arts and Sciences at Boston, there is an excellent example of this tendency described.

In the spring, a potato was left in a cellar where some roots had been kept during the winter, and which had only a small aperture for the admission of light at the upper end of one of its sides. The potato, which lay in the opposite corner of the aperture, shot out a runner, which first ran twenty feet along the ground, then crept up along the wall, and so through the opening by which light was admitted.

Providence, ever mindful of the wants of the human race, has endowed those plants which are of the greatest importance to mankind either with the property of adapting themselves to a great variety of climates, or, when confined to any individual climate, of flourishing there in almost any kind of soil. This is the case with several species of grain, the potato, &c., and that valuable plant, the cocoa. Palm vegetates vigorously in sandy and stony, as well as in the richest earth.

Many plants, common duckweed for example, are not firmly attached to the ground by their roots, but can change their situations at certain seasons of the year, sinking at one time to the bottom, and at others coming to the surface of the water.

THE FLITTING.

In an unpretending volume of sketches of Scottish rural life, entitled "My Grandfather's Farm," the following is given as illustrative of one of the most touching of all scenes, a sale of effects for debt, and which is not without its moral:—

"It was on the day before the flitting, or removal, that John Armour's farm-stock, and indeed every thing he had, but as much as might furnish a small cottage, was to be rouped to meet his debts. No doubt it was a heart-rending scene to all the family, though his wife considered all their losses light, when compared with her husband's peace of mind. The great bustle of the sale, however, denied him the leisure which a just view of his condition made most to be dreaded; so that it was not till late in the evening, when all was quiet again, his cherished possessions removed, and time allowed him to brood over his state, that the deep feelings of vexation and despair laid hold of his spirit.

The evening was one of remarkable beauty; the birds never more rapturous, the grass never greener around that farm-house. The turf seat on which old Hugh was wont to rest, in the corner of the little garden, was white with gowans; the willows and honeysuckles that over-arched it all full of life;—the air was bland, the cushat's distant cooing very plaintive—all but the inhabitants of the humble dwelling was tranquil and delighted. But they were downcast—each one pursued some necessary preparation for to-morrow's great change, saying little, but deeply occupied with sad thoughts. Once the wife ejaculated, 'Oh, that the morn was o'er!' 'Yes,' said her husband, 'the morn, and every morn o' them; but I wish this gloamin' had been stormy.' He could not settle—he could not eat—he avoided conversation, and, with his hat drawn over his brow, he traversed wearifully the same paths, and did over and over again the same things. It was near bed-time, when one of the children said to her mother, 'My father's stan'in' at the corner o' the stable, and didna speak to me when I spak' to him;—gang out, mother, and bring him in.' 'If he wad but speak to ane!' was the mother's answer. She went out—the case had become extreme—and she ventured to argue with and reprove him. 'Ye do wrang, John—this is no like yoursell;—the world's fu' o' affliction—ithers ken that as weel as you—ye mauna ha'e a' things your ain way; there's ane abune us wha has said, "In sorrow shalt thou eat thy bread all the days of thy life." Ye canna expect to gang free; and I maun say, it wadna be guid for ony o' us. May be greater ills are yet to befa' ye, and then ye'll rue sair that ye ha'e gi'en sic way at this time: come in, John, wi' me; time will wear a' this out o' mind.' He struck his hand against his brow—he grasped at his neck-cloth—and after choking on a few syllables which he could not utter, tears gushed from his eyes, and he melted in a long heart-rending fit of weeping. Oh! it is a sorrowful thing to see a strong, hard-featured man shedding tears! His sobs are so heavy, his wail so full-toned! John Armour, perhaps for twenty years a stranger to weeping, had now to burst the sealed sluices of manhood's grief, which nothing but the resistless struggle of agony could accomplish, ere relief could reach his labouring breast. Now it was he sought the dearest sanctuary on earth—he leaned upon his wife's bosom, and she lavished on him the riches of a woman's love. At length he went to rest, gentler in spirit, and borne down by a less frightful woe than what had lately oppressed him.

Next morning brought round the bustle of flitting. There is a deep interest attending a scene of this kind, altogether separate from the feelings of those who have to leave a favourite abode. Circumstances of

antiquity—of mystery, belong to it. The demolition even of an old house has something melancholy; the dismantling it of furniture is not less affecting. Some of the servants that had been at one time about the farm assisted on this occasion, and entered fully into the sentiments now described. 'That press has been there, I'll warran', this fifty years; it was his mother's, and cam on her blithe marriage-day; the like o't ye'll no see now-a-days—it's freck yet. Few hae seen the back o' thee, I trow, these twa days, but the wabsters and sclaters; they winna ken what to mak' o' this wark;—let me look into the back o't.' 'I wad be a wee eerie,' said another, feeling the gloomy appearance of the old empty dwelling suggest thoughts allied to superstition, 'about gangin' into that toom house at night; I wad aye be thinkin' o' meeting wi' auld Hugh, honest man.'

The flitting set off to a cottage about two miles distant; two cart-loads of furniture, one milk-cow, and the old watch-dog, were its amount. John Armour lingered a little behind, as did his wife, for she was unwilling to leave him there alone. He then proceeded to every part of the premises. The barn and stable kept him a few moments; the rest he hurried over, excepting the kitchen and spence. When he came to the kitchen (for it was the apartment he visited last), he leant his head for an instant against the mantel-piece, and fixed his eyes on the hearthstone. A deep sigh escaped him, and his wife then took him by the hand to lead him away, which he resisted not, only saying, 'I ha'e mind o' mony a thing that happened here,'—then casting his eyes hastily round the desolate apartment—'but fareweel to thee for ever.' In a few minutes they overtook the flitting, nor did he once turn again his head towards the desolate place, which had so firm a hold of his heart."

RULES IN ETIQUETTE.

When you write a letter to a friend, contractions in the name of the place you write from, in the name of the month, or in the concluding sentence, as, "Yours, &c.," are perhaps allowable; but when you write a letter to a person with whom you are not on familiar terms of intimacy, and who ranks higher than yourself in society, you must not use contractions. Every word must be written fairly out, and you must not close up the epistle by any thing like a hurried expression of courtesy. The same rule applies to the backing of the letter. When you write to a baronet, do not direct the letter with the contraction "Bart.;" write the word "Baronet" in full. Never use wafers for letters to persons who are any way above you in rank; indeed, nobody in good society now uses wafers except on very ordinary occasions, or in matters of business. In folding letters, do not try to make the doubling intricate or fantastic, which is a sign of a vulgar mind; just use simple folding. It is also reckoned improper to say "in haste" at the conclusion of letters. Never make use of paper gilt on the edges, whether in writing to high or low; for it is altogether unfashionable and antiquated, and is in reality of no use. You must, however, take care, in writing to persons in mourning, to use paper with black edges and black sealing-wax—the latter especially: to use red wax, under these circumstances, is considered a mark of rudeness or ignorance. By attending to these simple rules of etiquette in carrying on an epistolary correspondence, you will please those to whom you write, and indicate your refinement in manners.

A SCOTTISH TOWN-DRUMMER.

Almost every burgh in Scotland has its town-drummer, such a functionary being generally of fully greater use than even the Provost himself. These town-drummers are frequently men of great consideration in the place; and instances are known of their having made so much money in their vocation, that they could have laid down "pound for pound" with the whole of the members of the civic corporation. But no town-drummer that ever we heard of was so distinguished as the late Daniel Maccormick of Dundee. This remarkable individual—according to the account in the *Dundee Advertiser*—filled the various offices of town-drummer, town-officer, and billetmaster, and was, besides, celebrated for his extraordinary knowledge of the learned languages. "His history (says the above authority) is involved in some obscurity. His father, it is said, was a native of Lochaber, and had removed to London in the prosecution of his business as a dyer. Dan was born in the metropolis; but his father having died at an early age, he was removed to his friends in Lochaber, where he attempted to carry on the business which his father had followed; but, not finding encouragement, he removed to Glasgow in quest of employment. Here, during his leisure hours, he devoted himself to books; and his friends, observing his assiduity, were anxious that he should be educated as a Catholic priest. With this view, he was aided in the gratification of his love of learning; but the intentions of his friends were from some cause or other frustrated, and Dan enlisted in the Argyllshire Fencibles, and accompanied his regiment to Dundee about the year 1800. Through the interest of Provost Riddoch, Dan and a few others were discharged from the fencibles, with the view of securing their services in drilling the volunteers then embodying in Dundee. He was appointed one of the town-officers, and the others likewise succeeded to situations under the town. About ten years afterwards, Dan was appointed town-drummer, and, at a subsequent period, billetmaster. Seldom, we believe, has so high a degree of scholarship been possessed by any one in so humble a sphere as that in which Dan moved. To an intimate acquaintance with the Gaelic language, he united a knowledge of Hebrew, Samaritan, Syriac, Arabic, Greek, Latin, French, and German. He was also well skilled in music. While in the vigour of life, his performances on wind instruments were considered excellent. He had an extensive acquaintance with rare and curious books, and has left a considerable collection of his own, to be sold in Edinburgh. Dan lived the life of a bachelor; but he was not indifferent to the attractions of the fair. He has left behind him a daughter. One of our contemporaries gives the following anecdote of him. 'Some years ago, one Rabbi —— came to this town, and advertised that he would deliver lectures on the Hebrew and Persian languages. He wished the Town Hall for the occasion; and, accompanied by Dr R——, a gentleman since deceased, he proceeded to make his application for the use of the room. On their way, they met Maccormick with his drum; and the Doctor, who loved a joke, told their errand, and introduced his Jewish friend. Dan wished to try his mettle; and, pulling out a Psalter from his pocket, proceeded to interrogate the lecturer. The stranger was confounded; and, fearing to encounter the Provost, after the specimen he had had of the town-drummer, the Rabbi withdrew his advertisement, and carried his Hebrew roots to another quarter.' We have heard another version of this story; but which is the correct one, we cannot say. As related to us, the story was as follows:—'The learned Hebrew having heard of Dan's skill in philology, waited on him; and, after a very learned colloquy, departed with a high idea of his acquirements. He then repaired to a clergyman to make his pretensions known, and to solicit the divine's patronage. The reception the Rabbi received was such as to give him by no means a very exalted idea either of the clergyman's learning or urbanity; and, in his ire, he remarked, that he thought the Doctor of Divinity should be appointed to the situation of the Town-Drummer, and the Town-Drummer to that of the Doctor of Divinity."

A SPANISH VILLAGE.

Soon after entering this sierra, I passed through the most miserable village that I have seen in any part of Spain. It is quite impossible for one who has never seen the very lowest of the Spanish poor, to form the smallest conception of the general appearance of the inhabitants of this village. I saw between two and three hundred persons, and among these there was not one whose rags half covered his nakedness. Men and women were like bundles of ill-assorted shreds and patches of a hundred hues and sizes; and as for the children, I saw several entirely naked, and many that might as well have been without their tattered coverings. I threw a few biscuits among the children, and the eagerness with which they fought for and devoured them, reminded me rather of young wolves than of human beings. The badness of the pavement, and the steepness of the street, made it necessary for the diligence to go slowly; and I profited by the delay to look into one or two of the miserable abodes of these unfortunate beings. I found a perfect unison between the dweller and his dwelling. I could not see one article of furniture; no table, no chair; a few large stones supplied the place of the latter; for the former there was no occasion; and something resembling a mattress upon the mud floor was the bed of the family. Leaving this village, I noticed two stone pillars, and a wooden pole across, indicating that the proprietor possesses the power of life and death within his own domain. I forget the name of the grandee at whose door lies all this misery; but if the power of life and death be his, and if he cannot make the former more tolerable, it would be humanity to inflict the latter.—*Spain in* 1830.

THE PIG POINTER.

Toomar, the gamekeeper of Sir Henry P. St John Mildmay, broke-in a black sow to find game, back, and stand to her point, nearly as steadily as a well-bred dog. This sow was a thin long-legged animal, one of the ugliest of the New Forest breed. When young, it manifested a great partiality for some pointer puppies, then under the care of the keeper at Broomy lodge. It often played and fed with them. And it occurred one day to Toomar, that, as he had broken many an obstinate dog, he might also succeed in breaking a pig. The little animal willingly cantered along with him a considerable distance from home; he enticed her still farther by means of a kind of pudding, made of barley-meal, which he carried in one of his pockets. His other pocket was filled with stones, to throw at the pig whenever she misbehaved, as she was too frolicsome to allow herself to be caught and corrected like dogs. She proved, however, upon the whole, to be tolerably tractable; and he soon taught her what he wished. by this system of rewards and punishments. She quartered her ground as regularly as any pointer, stood stock-still when she came upon game, and backed dogs with great steadiness. When she came on the cold scent of game, she slackened her trot, and gradually dropped her ears and tail till she was certain, and then fell down on her knees. So stanch was she, that she would frequently remain five minutes and upwards on her point. As soon as the game rose, she always returned to Toomar, grunting very loud for her reward of pudding, if it was not immediately given to her. When Toomar died, his widow sent the pig to Sir Henry Mildmay, who kept it for three years, but never used it, except for the purpose of occasionally amusing his friends. In doing this, a fowl was put into a cabbage net, and hidden amongst the fern in some part of the park; and the sagacious animal never failed to point it in the manner above described. Sir Henry was obliged at length to part with this sow, from a circumstance as singular as the other occurrences of her life:—A great number of lambs had been lost, nearly as soon as they were dropped, and a person being sent to watch the flock, detected this sow in the very act of devouring a lamb. This carnivorous propensity was ascribed to her having been accustomed to feed with the dogs, and to eat the flesh on which they fed. Sir Henry sent her back to Mrs Toomar, who sold her to Mr Skyes, of Broakwood, in the New Forest, where she died the usual death of a pig, and was converted into bacon.—*Brown's Anecdotes of Quadrupeds.*

THE VENTRILOQUIST.

A circumstance, which powerfully excited the risible muscles of a number of the town's-people, once occurred in Grimsby, an English country town. It happened that Mr Love, the ventriloquist, had publicly announced his intention of performing in the Assembly Rooms. On the appointed evening, a tolerably numerous audience had assembled; but the performance had scarcely commenced, when it was suddenly interrupted by the most dismal yells and howlings from above. It appears that in that part of the entertainment, when, by means of his singular powers of vocal deception, he causes an invisible agent to be heard singing on the roof of a building many yards distant from that in which he exhibits, then gradually approaching, until it is finally heard in the act of descending the chimney attached to the Assembly Rooms. A native of an adjoining village, who had been induced to patronise the entertainment, and who, we presume, had never before witnessed a similar performance, and consequently was not aware of the extent of the illusion which an accomplished ventriloquist is capable of creating, felt convinced that a second person "had a finger in the pie," and being well acquainted with the house, slipped out, unperceived by the audience, and ascended by the back stairs in the dark to the roof of the building, with the firm determination of opening the eyes of the audience, and exposing the confederate of the performer. At this juncture, two other wiseacres in the company entertained exactly the same opinion, and, accordingly, followed the steps of him who had first made his exit from the apartment. Arrived at the summit of the garret stairs, they found the trap-door wide open—this they thought looked suspicious, but, on ascending to the tiles, they discovered the first-mentioned Paul Pry in the act of reconnoitring, with his head placed close to the chimney pot. Doubt was now out of the question; they therefore commenced belabouring their unsuspecting victim with such vigour, that, had not his wailings brought mine host (who now began to suspect the devil was in the place in reality), and some of the people connected with the establishment, with lights, to his assistance, the consequences might perhaps have been rather serious. As it was, a mutual explanation speedily followed; and the ventriloquist, as might be expected, joined heartily in the convulsive roar of laughter which it occasioned, whilst the unlucky wights against whom it was directed were glad to make a precipitate retreat.

ROMAN FOUNDER.

An auctioneer, putting up an antique Roman helmet for sale, told the company he was informed that it had belonged to Romulus, the Roman founder; but whether he was an iron or a brass founder, he could not tell.

NATIONAL EPAULETTES.

The late King George the Fourth, when Prince of Wales, among other splendid articles of dress he was accustomed to exhibit, appeared one day in public with a pair of most brilliant diamond epaulettes. This happening at the very time the nation was called upon to pay his debts, gave occasion for criticism even among the lower ranks. "Do you see what fine things the Prince has got on his shoulders?" said one dirty-looking fellow to another. "Never mind, Tom," answered his companion; "they'll soon be on all our shoulders." Some person of rank, overhearing this remark, told it over again to the Prince, who, fond of a joke, seemed highly amused, although the jest was at his own expense.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS: stereotyped by A. KIRKWOOD; and printed by BALLANTYNE.

No. 67. SATURDAY, MAY 11, 1833. PRICE THREE HALFPENCE.

OLD BACHELORS.

ABSTINENCE from marriage, where it is dictated by prudence, is not only commendable in itself as a safeguard against individual misery, but is entitled to the gratitude of the public, inasmuch as it is, when practised upon a large scale, at least in a country of the *old* world, the preservative of a nation from moral degradation and general distress.

This proposition, however, is of no weight against another which we have been in the habit of hearing from the lips of Miss E. P., an amiable young lady with whom we have had the honour of being acquainted for the last two and thirty years—namely, that "it is a *great shame* (such are her emphatic words) for gentlemen who have houses of their own, and every thing comfortable, that they should not take wives." Perhaps there is a little personal feeling in the remark of our respected friend, seeing that, in her own immediate neighbourhood, there are several middle-aged men, with capital domestic establishments—fit for the accommodation of a family every one of them—who yet, year after year, live dreamily on in single comfortlessness, apparently unobservant that there are ladies in the same predicament, almost next door, whom they might at once render happy, and themselves too, if they only would think of proposing a union of their respective places of residence.

Personal, or not personal, the remark is just: we do think it "a great shame" that some respectable persons of our acquaintance, between the ages of thirty and forty, not to speak of a few a little older, should confine to themselves the enjoyment, such as it is, of a house and fortune every way comfortable, when they at once might increase infinitely their own happiness, and also that of others, if they would only open their eyes to the situation of such young ladies as our friend Miss E. P., and obey the grand scripture injunction, which commands them to love their neighbours as themselves. It is truly provoking to see men of this kind pretending to think themselves happy with their starved beef-steak dinners, and their furniture unconscious of ever having been deranged or rumpled by children, all the time that their hearts secretly confess, and every other person knows, how deficient they are in all that gives a real charm to existence.

Like the most of wrong things, resolute celibacy of this kind arises from want of sense: the old bachelor is simply a man who does not see human life in a right point of view, and has no foresight of the future. He has perhaps had a hard struggle with fortune in his early years, and, never having been able to get over the fright which poverty gave him in his youth, thinks, even in the midst of plenty, and while life is advancing to its meridian, that, so far from having any thing to spare for wife or for child, he is hardly sure of his own wants being supplied for the remainder of his days. The hearts of some men become quite hardened by the prudential maxims upon which they have acted, and which, like the old fortresses of our native country, survive long after there is any occasion for them. Then there is another set—children of fortune—men who have been wandering about all their days, till, in the words of a quaint writer, "they almost forget what a home is." These, of course, let them settle when they like, or where they like, have an absolute difficulty in comprehending the idea of matrimony, and, even if they could understand it, would fear to tie themselves down, lest they should, some day hereafter, take it into their heads to go out a voyage to Vera Cruz, and be a little bothered with "the childer." Others are prevented from marrying by lending too serious attention to those silly bugbears about matrimony, which are occasionally the subject of sportive conversation—such, for instance, as the chance of a scolding wife, or of children who turn out ill, and so forth—as if any venture in this life were assured against a risk of some kind or other. There is still another and larger class, whom we shall first describe, and then show how plain a tale will put them down.

This class may be called the Jacobin Bachelors. They repudiate matrimony as a thing calculated to impair their personal liberty. Give us, they cry, the freedom, the independence, of a single life. None of your chains for us. We are the hearty boys, who despise all petticoat government. We must be sole monarchs of ourselves, and have nobody whatsoever to exert the least control over our actions. We'll remain

> —— free as nature first made man,
> Ere the base laws of servitude began,
> And wild in woods the noble savage ran.

Stop a little, gentlemen, and let us consider your case. Methinks your quotation is somewhat infelicitous. The noble savage who ran so wildly through these primitive forests long since degenerated into peat-moss, was a person, let it always be kept in mind, without breeches. Not a rag of toggery had he of any kind, nor a house to shelter him, and his freedom consisted in a permission to knock every other naked rascal like himself on the head if he could, always with the understanding that he was also to be knocked on the head, whenever any other body had the courage or strength to do so. These gentlemen have found a convenience in submitting to certain laws and rules, which, no doubt, trench dreadfully on freedom, but, at the same time, conduce much to comfort. In short, men have submitted to the bondage of society. Now, what is matrimony but one of those salutary restraints which sensible people in general have agreed to submit to, in order to increase their mutual happiness? There may be a wild momentary pleasure in an unlimited indulgence of the will; but if it be not reasonable and innocent, it is *only* momentary. The servitude is incurred, through an impulse of the reason, in order that our pleasure may be prolonged and protected. Thus matrimony becomes a "linked sweetness long drawn out," while there never can be any thing but an irrational and visionary happiness in the sense that we are free from it. Always remember that freedom is not in itself a good—it is only a means of good; and that, in cases where it produces a sensible benefit, it is to be appreciated, but in no other. If an exemption from matrimonial control produced either a general or an individual good, we would say, by all means give not thy soft heart to woman. But this is not the case. An universal exemption from matrimony would make the world a wilderness—a particular case of it makes a man a desert. It is an evil in every way it can be taken. What, then, is the use of the abstract freedom, if it be not attended with any of the benefits of freedom? The whole is obviously a mistake of the means for the end; and the Jacobin Bachelors, we suspect, only fear those unseen chains which love imposes, because they are themselves fond of rule.

Messieurs the Bachelors have several other fallacies, and as we are resolved to leave them not a leg to stand upon, we shall tumble the whole of these down one after the other. As part of the preceding fallacy about freedom, they conceive that there must be something irksome, if not almost impossible, in the constancy which matrimony requires as one of its cardinal rules. We know the slipperiness and vagrancy of our own minds, say they very cunningly, and we really cannot deliberately undertake a solemn obligation which we know we would soon break.

Now, this is a mere hypocritical shift, for, instead of there being any natural tendency to inconstancy in men, there is an almost insurmountable disposition to constancy; insomuch that they are almost as certain to be constant to what is bad, as to what is good. Constancy forsooth!

Fallacy the second is an idea they have, or pretend to have (for many of their arguments are only assumed), that, by keeping clear of matrimony, they avoid all care, expense, and responsibility, respecting the next generation, and secure an equable and certain happiness in life, even to its close. Poor, unhappy men! it is little they know of the way in which affairs are really to run hereafter. In regard to the first expectation, we would just ask if any one ever knew an old bachelor who was not burdened some way or other with children? Are they not sure, just in proportion to their own childlessness, to have brothers and sisters who bring whole legions of children into the world—which children regularly are cantoned out in alternate lots upon their bachelor uncle, partly to relieve the press of matter at home, and partly from a benevolent desire to provide him with company, wherewithal to cheer his solitary parlour? Is not "our uncle" appealed to on every occasion of extraordinary expense, such as the fitting out of one of us for India, and the putting another of us to college to study medicine, and so forth? And does he not thus in the long-run dissipate as much of his hard-earned gains as if he had had children of his own—in which case, moreover, he would have had a little more of the honour to console him for the cost? No, no; tell us not of the *saving* of bachelorship. One way or another, the expense of rearing the next generation is pretty well allocated over society.

But old bachelors are not suffered to escape with simply providing for a troop of nephews and nieces; they very frequently become the prey of their servants, who consider their property as fairly liable to spoliation in every possible shape. Where is the old bachelor—the man who perhaps abstained from marriage to escape being ruled—who is not wholly ruled, three-quarters tormented, and at least half plundered by a Jenny, or a Betty, or a Mary—some old withered female domestic, who knows his cue, and manages him accordingly? No, no; it is all stuff to talk of there being any saving, or any defence against being ruled in old bachelorhood. If bachelors knew their own interests in time, they would in reality marry in self-defence.

Finally, as to their assurance of happiness to the very close of life, nothing could be more wilfully absurd. If happiness depended alone upon wealth—which it notoriously does not—then it might be secured. But happiness depends upon the cultivation of the social affections, so far as it depends on any thing earthly; and this is the very point which the bachelor has neglected. While more prudent men made provision in middle life for the necessities of age, by rearing an attached and honourable offspring, who at last become a hedge of shelter around him, the poor timid and unforeseeing bachelor thought, that, because he now was contented to enjoy wealth, he would always be so; and, accordingly, he goes on in a state of declared rebellion against nature, till, at length, when it is too late, he finds himself exposed on the common of society, unable to comfort himself with his gold, and totally destitute of what alone could

comfort him—a possession which gold could once have cheaply bought, if he had only had the heart to disburse it. Such is the latter part of the pretended happiness of a single life—*with* wealth, courted by insincere friends, or at least friends in whose sincerity there can be no confidence—*without it*, only the more fully exposed to all the evils of poverty.

POPULAR INFORMATION ON SCIENCE.

SLEET.

HAVING explained the origin, and phenomena which attend the fall, of snow, we shall now proceed to consider the nature of that peculiar modification of frozen vapour known under the name of sleet, with the appearance of which we doubt not that most of our readers are familiar. When aqueous globules freeze in the higher regions of the atmosphere, they aggregate together, and form flakes of snow; and when these have partly thawed, and have again become frozen, they constitute sleet, which is thus caused by the variable temperature of the atmosphere. Sleet falls at all seasons, and sometimes changes into rain, and sometimes into snow. It occasionally falls indeed very heavily, gathering and freezing additional moisture in its descent. Thus, in the Meteorological Observations appended to White's Natural History of Selborne, we read, that, on the 20th of January 1768, "in a lane near Hackwood Park, many rooks, attempting to fly, fell from the trees, with their wings frozen together by the sleet that froze as it fell." Numerous other examples of sleet-storms have been recorded, many of which will be found in Luke Howard's Climate of London, to which excellent meteorological work we beg especially to refer.

HAZE, MIST, FOG.

The atmosphere which surrounds this earth always contains a certain quantity of moisture, which, according to the diminution of temperature, becomes more or less condensed; so that, in this country, the air is seldom perfectly transparent. When the watery particles are only partially or imperfectly condensed, so as to produce an indefinite obscuration, they constitute a haze, which generally may be observed of an evening, when the temperature of the air becomes diminished by the decline of the sun towards the horizon. When viewed from a distance, the surface of the earth always appears enveloped in a haze of greater or lesser density; and although, when sailing, for example, on the Pacific Ocean, the atmosphere may appear very clear, yet, on being viewed from a high mountain, the water will appear obscured by a haze, which will be found to extend many feet above its surface. When the watery vapour in the surrounding air becomes more condensed, with a defined outline in the form of a cloud, either resting on the surface of the earth, or a few feet above it, then it is termed a mist; and when the whole atmosphere around appears equally obscured, then we give it the name of a fog, which, however, is not to be confounded with that moist and obscured state of the air, which often accompanies our easterly and westerly winds. Mists, as well as fogs, consist of thin vesicles of water containing air. When Saussure, in ascending a mountain, became enveloped in a mist, he observed that some of these vesicles were larger than peas, and they burst on catching them in his hand. How these vesicles become formed, is not well understood; but the general opinion is, that mists and fogs arise from air of unequal temperatures, holding moisture in solution, mingling with each other. Accordingly, the mixture of the evening sea breeze, with the air above the land, often produces dense mists, for the air above the sea is warmer than that above the land, because warm water is lighter than cold water, and, therefore, when water becomes cold at the surface, it sinks, and a warmer mass rises to supply its place; the temperature, however, of the land is limited to its surface, or penetrates only very slowly its upper soil; consequently, the air above it is cooler than that above water; and when they intermix, a condensation of aqueous vapour into mist or fog takes place.* Besides this, the contraction of the air from its becoming colder after sunset, often produces a condensation of the watery particles floating in it. In addition to which, there can be no doubt that a certain quantity of vapour rises up, or evaporates from the earth itself, which we may suppose to have been within a short period moistened by rain, and this, having become elevated to some distance above the ground, in like manner becomes condensed. During the night, therefore, the air above the surface of the earth is thus generally rendered hazy, and light mists are observed hanging in gauzy folds along the sides, and around the summits of hills and mountains;—hence, Lord Byron, in noticing the approach of morning, gives us this beautiful passage—

> "Night wanes; the vapours round the mountains curled,
> Melt into morn, and light awakes the world."

Fogs are often, especially in large towns, remarkably dense; indeed, so much so as to occasion serious accidents from their interference with distinct vision. This frequently happens in London, and in other large cities, and arises from smoke, vapours, dust, &c. being stagnated in the thick fog. On certain calm winter days it may be observed, that the smoke, on leaving the chimneys, descends towards the ground, and downward currents often set through flues at the bottom of which there is no fire. Fogs seldom rise high in the atmosphere;—hence, Dr Darwin, in giving an account of one which overspread a tract of ground through which he had occasion to ride, states, that on every rising of the ground he was quite above its level, though in descending again it was so thick that he could scarcely see a yard beyond his horse's head. In the northern regions, fogs are extremely dense, owing, doubtless, to the difference between the temperature of the air which sweeps over the immense tracts of ice extending through those desolate regions, and that of the air which passes over the warmer surface of the ocean. It is one of the greatest annoyances which the whalers and navigators in those dangerous seas have to encounter. "They seldom occur," says Captain Scoresby, "with high winds; yet, in one or two instances, I have observed them very thick, even in storms. Rain generally disperses them; but, after the rain ceases, when the air is warm and damp, the fog often returns with increased density, so that it passes the eyes like smoke, and contracts the circle of vision to a radius of fifty or sixty yards. When such fogs prevail, with a freezing temperature, they usually varnish the rigging, yards, masts, and other apparatus of ships, with transparent ice, which sometimes increases to the thickness of near an inch, and is apt, when dislodged by any motion of the rigging, to fall in showers, and cut the faces of those on deck."† In those high northern latitudes, fogs prevail during the greater part of the month of July, and sometimes for considerable intervals in June and August. They often produce remarkable ocular deceptions; thus, by increasing the apparent distance of objects, they sometimes magnify men into giants, hummocks of ice into mountains, and common pieces of drift ice into heavy floes or bergs. "When people walk," says Gilbert White, "in a deep white fog by night with a lantern, if they will turn their backs to the light, they will see their shades impressed on the fog in rude gigantic proportions. This phenomenon seems not to have been attended to, but implies the great density of the meteor at that juncture."

Fogs generally affect the hygrometer, or that instrument by which the quantity of moisture in the atmosphere is indicated, but sometimes they have no effect upon it, and they are then termed "dry fogs." There was a remarkable fog of this description, which spread over the whole of Europe, and part of Asia and America, for some months, in the summer of 1783. During its continuance, there was much thunder and lightning, and the electricity of the air appeared to be much increased. At that time, Mount Hecla, in Iceland, was in a state of eruption, and it is imagined that it had its origin from that source. The air at such times has a disagreeable smell, and it is generally considered that such fogs appear when earthquakes are about to happen in volcanic regions.

THE INDIAN WIFE,

A TALE.

TAHMIROO was the daughter of a powerful chieftain of the Sioux American Indians, and she was the only being ever known to turn the relentless old man from a savage purpose. Something of this influence was owing to her infantile beauty, but more to the gentleness of which that beauty was the emblem. Hers was a species of loveliness rare among Indian girls. Her figure had the flexile grace so appropriate to protected and dependent women in refined countries; her ripe pouting lip, and dimpled cheek, wore the pleading air of aggrieved childhood; and her dark eye had such an habitual expression of timidity and fear, that the Young Sioux called her the "Startled Fawn." I know not whether her father's broad lands, or her own appealing beauty, was the most powerful cause of her admiration; but certain it is, Tahmiroo was the unrivalled belle of the Sioux. She was a creature all formed for love. Her downcast eye, her trembling lip, and her quiet submissive motion, all spoke its language; yet various young chieftains had in vain sought her affections, and when her father urged her to strengthen his power by an alliance, she answered him only by her tears.

This state of things continued until 1765, when a company of French traders came to reside there, for the sake of deriving profit from the fur trade. Among them was Florimond de Rance, a young indolent Adonis, whom pure ennui had led from Quebec to the Falls of St Anthony. His fair, round face, and studied foppery of dress, might have done little towards gaining the heart of the gentle Sioux; but there was a deference and courtesy in his manner, which the Indians never pay woman; and Tahmiroo's deep sensibilities were touched by it. A more careful arrangement of her rude dress, and anxiety to speak his language fluently, and a close observance of his European customs, soon betrayed the subtle power which was fast making her its slave. The ready vanity of the Frenchman quickly perceived it. At first he encouraged it with that sort of undefined pleasure which man always feels in awakening strong affection in the hearts of even the most insignificant. Then the idea that, though an Indian, she was a princess, and that her father's extensive lands on the Missouri were daily becoming of more consequence to his ambitious nation, led him to think of marriage with her as a desirable object. His eyes and his manner had said this, long before the old chief began to suspect it; and he allowed the wily Frenchman to twine himself almost as closely around his heart, as he had around the more yielding soul of his darling child. Though exceedingly indolent by nature, Florimond de Rance had acquired skill in many graceful acts, which excited the wonder of the savages.

He fenced well enough to foil the most expert antagonist; and in hunting, his rifle was sure to carry death to the game. These accomplishments, and the facility with which his pliant nation conform to the usages of every country, made him a universal favourite; and, at his request, he was formally adopted as one of the tribe. But, conscious as he was of his power, it was long before he dared to ask for the daughter of the haughty chief. When he did make the daring proposition, it was received with a still and terrible wrath, that might well fright him from his purpose. Rage showed itself only in the swelling veins and clenched hand of the old chief.

With the boasted coldness and self-possession of an Indian, he answered, "there are Sioux girls enough for the poor pale faces that come among us. A king's daughter weds the son of a king. Eagles must sleep in an eagle's nest."

In vain Tahmiroo knelt and supplicated. In vain she promised Florimond de Rance would adopt all his enmities and all his friendships; that in hunting, and in war, he would be an invaluable treasure. The chief remained inexorable. Then Tahmiroo no longer joined in the dance, and the old man noticed that her rich voice was silent when he passed her wigwam. The light of her beauty began to fade, and the bright vermilion current, which mantled under her brown cheek, became sluggish and pale. The languid glance she cast on the morning sun and the bright earth, entered into her father's soul. He could not see his beautiful child thus gradually wasting away. He had long averted his eyes whenever he saw Florimond de Rance; but one day, when he crossed his hunting path, he laid his hand on his shoulder, and pointed to Tahmiroo's dwelling. Not a word was spoken. The proud old man and the blooming lover entered it together. Tahmiroo was seated in the darkest corner of the wigwam, her head leaning on her hand, her basket-work tangled beside her, and a bunch of flowers, the village maidens had brought her, scattered and withering at her feet.

The chief looked upon her with a vehement expression of love, which none but stern countenances can wear. "Tahmiroo," he said, in a subdued tone, "go to the wigwam of the stranger, that your father may again see you love to look on the rising sun, and the opening flowers." There was mingled joy and modesty in the upward glance of the "Startled Fawn" of the Sioux; and when Florimond de Rance saw the light of her mild eye, suddenly and timidly veiled by its deeply-fringed lid, he knew that he had lost none of his power.

The marriage song was soon heard in the royal wigwam, and the young adventurer became the son of a king.

Months and years passed on, and found Tahmiroo the same devoted submissive being. Her husband no longer treated her with the uniform gallantry of a lover. He was not often harsh, but he adopted something of the coldness and indifference of the nation he had joined. Tahmiroo sometimes wept in secret; but so much of fear had lately mingled with her love, that she carefully concealed her grief from him who had occasioned it. When she watched his countenance, with that pleading innocent look which had always characterized her beauty, she sometimes would obtain a glance such as he had given her in her former days; and then her heart would leap like a frolicsome lamb, and she would live cheerfully on the remembrance of that smile, through many wearisome days of silence and neglect. Never was woman, in her heart-breaking devotedness, satisfied with such slight testimonials of love, as was this gentle Sioux girl. If Florimond chose to fish, she would herself ply the oar, rather than he should suffer fatigue; and the gaudy canoe her father had given her, might often be seen gliding down the stream, while Tahmiroo dipped her oar in unison with her soft rich voice, and the indolent Frenchman lay sunk in luxurious repose. She had learned his religion; but for herself she never prayed. The cross he had given her was always raised in supplication for him; and if he but looked unkindly on her, she kissed it, and invoked its aid, in agony of soul. She fancied the sound of his native land might be dear to him; and she studied his language with a patience and perseverance to which the savage had seldom been known to submit. She tried to imitate the dresses she had heard him describe; and if he looked

with a pleased eye on any ornament she wore, it was always reserved to welcome his return. Yet, for all this lavishness of love, she asked but kind approving looks, which cost the giver nothing. Alas, for the perverseness of man, in scorning the affection he ceases to doubt! The little pittance of love for which poor Tahmiroo's heart yearned so much, was seldom given. Her soul was a perpetual prey to anxiety and excitement; and the quiet certainty of domestic bliss was never her allotted portion. There were, however, two beings on whom she could pour forth her whole flood of tenderness, without reproof or disappointment. She had given birth to a son and daughter of uncommon promise. Victoire, the eldest, had her father's beauty, save in the melting dark eye, with its plaintive expression, and the modest drooping of its silken lash. Her cheeks had just enough of the Indian hue to give them a warm, rich colouring; and such was her early maturity, that at thirteen years of age, her tall figure combined the graceful elasticity of youth, with the majesty of womanhood. She had sprung up at her father's feet, with the sudden luxuriance of a tropical flower; and her matured loveliness aroused all the dormant tenderness and energy within him. It was with mournful interest he saw her leaping along the chase, with her mother's bounding, sylph-like joy; and he would sigh deeply when he observed her oar rapidly cutting the waters of the Missouri, while her boat flew over the surface of the river like a wild bird in sport—and the gay young creature would wind among the eddies, or dart forward with her hair streaming on the wind, and her lips parted with eagerness. Tahmiroo did not understand the nature of his emotions. She thought, in the simplicity of her heart, that silence and sadness were the natural expressions of a white man's love; but when he turned his restless gaze from his daughter to her, she met an expression which troubled her. Indifference had changed into contempt; and woman's soul, whether in the drawing-room or in the wilderness, is painfully alive to the sting of scorn. Sometimes her placid nature was disturbed by a strange jealousy of her own child. "I love Victoire only because she is the daughter of Florimond," thought she; "and why, oh! why, does he not love me for being the mother of Victoire?"

It was too evident that De Rance wished his daughter to be estranged from her mother and her mother's people. With all members of the tribe, out of his own family, he sternly forbade her having any intercourse; and even there he kept her constantly employed in taking dancing lessons from himself, and obtaining various branches of learning from an old Catholic priest, whom he had solicited to reside with him for that purpose. But this kind of life was irksome to the Indian girl, and she was perpetually escaping the vigilance of her father, to try her arrow in the woods, or guide her pretty canoe over the waters. De Rance had long thought it impossible to gratify his ambitious views for his daughter without removing her from the attractions of her savage home; and each day's experience convinced him more and more of the truth of this conclusion.

To favour his project, he assumed an affectionate manner towards his wife; for he well knew that one look or word of kindness would at any time win back all her love. When the deep sensibilities of her warm heart were roused, he would ask for leave to sell her lands; and she, in her prodigality of tenderness, would have given him any thing, even her own life, for such smiles as he then bestowed. The old chief was dead, and there was no one to check the unfeeling rapacity of the Frenchman. Tract after tract of Tahmiroo's valuable land was sold, and the money remitted to Quebec, where he intended to convey his children, on pretence of a visit, but in reality with the firm intent of never again beholding his deserted wife.

A company of Canadian traders chanced to visit the Falls of St Anthony just at this juncture, and Florimond de Rance took the opportunity to apprise Tahmiroo of his intention to educate Victoire. She entreated with all the earnestness of a mother's eloquence; but she pled in vain. Victoire and her father joined the company of traders on their return to Canada. Tahmiroo knelt, and fervently besought that she might accompany them. She would stay out of sight, she said; they should not be ashamed of her among the great white folks of the east; and if she could but live where she could see them every day, she should die happier.

"Ashamed of you! and you the daughter of a Sioux king!" exclaimed Victoire proudly, and with a natural impulse of tenderness she fell on her mother's neck and wept.

"Victoire, 'tis time to depart," said her father, sternly. The sobbing girl tried to release herself, but she could not. Tahmiroo embraced her with the energy of despair; for, after all her doubts and jealousies, Victoire was the darling child of her bosom—she was so much the image of Florimond when he first said he loved her.

"Woman! let her go!" exclaimed De Rance, exspearated by the length of the parting scene. Tahmiroo raised her eyes anxiously to his face, and she saw that his arm was raised to strike her.

"I am a poor daughter of the Sioux; oh! why did you marry me?" she exclaimed, in a tone of passionate grief.

"For your father's land," said the Frenchman, coldly.

This was the drop too much. Poor Tahmiroo, with a piercing shriek, fell on the earth, and hid her face in the grass. She knew not how long she remained there. Her highly-wrought feelings had brought on a dizziness of the brain, and she was conscious only of a sensation of sickness, accompanied by the sound of receding voices. When she recovered, she found herself alone with Louis, her little boy, then about six years old. The child had wandered there after the traders had departed, and having in vain tried to waken his mother, he laid himself down by her side, and slept on his bow and arrows. From that hour Tahmiroo was changed.

Her quiet submissive air gave place to a stern and lofty manner; and she, who had always been so gentle, became as bitter and implacable as the most blood-thirsty of her tribe. In little Louis all the strong feelings of her soul were centred; but even her affection for him was characterized by a strange, unwonted fierceness. Her only care seemed to be to make him like his grandfather, and to instil a deadly hatred of white men. The boy learned his lessons well. He was the veriest little savage that ever let fly an arrow. To his mother alone he yielded any thing like submission; and the Sioux were proud to hail the haughty child as their future chieftain.

Such was the aspect of things on the shores of the Missouri, when Florimond de Rance came among them, after an absence of three years. He was induced to make this visit, partly from a lingering curiosity to see his boy, and partly from the hope of obtaining more land from the yielding Tahmiroo. He affected much contrition for his past conduct, and promised to return with Victoire before the year expired. Tahmiroo met him with the most chilling indifference, and listened to him with a vacant look, as if she heard him not.

It was only when he spoke to her boy that he could arouse her from this apparent lethargy. On this subject she was all suspicion. She had a sort of undefined dread that he, too, would be carried away from her; and she watched over him like a she-wolf, when her young is in danger. Her fears were not unfounded; for De Rance did intend, by demonstrations of fondness, and glowing descriptions of Quebec, to kindle in the mind of his son a desire to accompany him.

Tahmiroo thought the hatred of white men, which she had so carefully instilled, would prove a sufficient shield; but many weeks had not elapsed before she saw that Louis was fast yielding himself up to the fascinating power which had enthralled her own youthful spirit. With this discovery came horrible thoughts of vengeance, and more than once she had nearly nerved her soul to murder the father of her son; but she could not. Something in his features still reminded her of the devoted young Frenchman, who had carried her quiver through the woods, and kissed the mocassin he had stooped to lace; and she could not kill him.

The last cutting blow was soon given to the heart of the Indian wife. Young Louis, full of boyish curiosity, expressed a wish to go with his father, though he at the same time promised a speedy return. He always had been a stubborn boy, and she felt now as if her worn-out spirit would vainly contend against his wilfulness. With that sort of resigned stupor which often indicates approaching insanity, she yielded to his request; exacting, however, a promise that he would sail a few miles down the Mississippi with her the day before his departure.

The day arrived. Florimond de Rance was at a distance on business. Tahmiroo decked herself in the garments and jewels she had worn on the day of her marriage, and selected the gaudiest wampum belts for the little Louis.

"Why do you put these on?" said the boy.

"Because Tahmiroo will no more see her son in the land of Sioux," said she, mournfully, "and when her father meets her in the Spirit Land, he will know the beads he gave her."

She took the wondering boy by the hand, and led him to the water side. There lay the canoe her father had given her when she left him for "the wigwam of the stranger." It was faded and bruised now, and so were all her hopes. She looked back on the hut where she had spent her brief term of wedded happiness, and its peacefulness seemed a mockery of her misery. And was she—the lone, the wretched, the desperate, and deserted one—was she the "Startled Fawn" of the Sioux, for whom contending chiefs had asked in vain? The remembrance of all her love and all her wrongs came up before her memory, and death seemed more pleasant to her than the gay dance she once loved so well. But then her eye rested on her boy—and, O God! with what an agony of love! It was the last vehement struggle of a soul all formed for tenderness. "We will go to the Spirit Land together," she exclaimed; "he cannot come there to rob me!"

She took Louis in her arms, as if he had been a feather, and springing into the boat, she guided it towards the Falls of St Anthony.

"Mother, mother! the canoe is going over the rapids!" screamed the frightened child. "My father stands on the waves and beckons!" she said. The boy looked at the horribly fixed expression of her face, and shrieked aloud for help.

The boat went over the cataract.

Louis de Rance was seen no more. He sleeps with the "Startled Fawn" of the Sioux, in the waves of the Mississippi!*

BIOGRAPHIC SKETCHES.

MISS JANE PORTER.

FEMALE authorship is one of the most prominent and characteristic distinctions of the present age. It is only in comparatively very recent times that woman has come forward to vindicate her claims to mental eminence, and to show that she also is endowed with powers sufficient to run through all the notes of the literary gamut, from the philosophical erudition of a Dacier and a De Staël, to the scrutinizing discrimination of an Edgeworth, a Mitford, or a Ferrier; and the imaginative vigour of a Baillie, a Barbauld, and a Hemans.

Of those who have distinguished themselves in our own day by high talents and indefatigable perseverance in their exertions, we know of none more truly worthy of our notice than the two accomplished sisters, Jane and Anna Maria Porter, and have much pleasure in dedicating a few columns to a biographical and literary sketch of the former. To the merits of the author of the "Hungarian Brothers" we intend also shortly to turn the attention of our readers.

The father of the family, of which Misses Jane, Anna Maria, and Sir Robert Ker Porter, are members, was an officer in the British army, who, dying prematurely, left his children to the care of his estimable consort, who yet survives at the advanced age of eighty-four.

Jane, the subject of the present cursory memoir, was born on the English border, and in childhood, along with her sister and brother, was carried over the Tweed to receive the rudiments of her education in Scotland, under the tuition of the well-known George Fulton, late of Hanover Street, Edinburgh, author of the Pronouncing Dictionary, and other excellent school books; a man who, in his retirement from public life, now enjoys the honour and respect to which his talents so justly entitle him. By none are these sentiments more warmly expressed than by his three distinguished pupils, in whom his animated lessons first kindled that love of distinction and thirst for fame which they have each so nobly achieved. Indeed, to the enthusiasm with which he used to expatiate on the glories of the historic heroes of Cambuskenneth and Bannockburn, the subject of this biographical sketch has been often heard to attribute the most vivid of those early impressions which subsequently led her to select the "Scottish Chiefs" as a theme worthy of embellishment.

Mrs Porter, from the slender means devolving to her as the widow of a younger brother, continued to live in quiet retirement, surrounded by children in whom she had every reason to delight, and finding in their society a more than equivalent for the privations to which fortune restricted her. The whole three were intense students, and gave themselves up to their love of reading, and of the fine arts. Books and the pencil constituted the ruling passion of the trio; and while the brother was sketching on his slate Achilles or Æneas, the Red Cross Knight or the Holy Nun, the Wallace or the Bruce, the sisters alternately read aloud the historic page, which his genius loved to illustrate. Robert thus more effectually cultivated the talent, which, in after-times, produced the finely finished pictures of our country's victories; one of which, that illustrative of the battle of Agincourt, was presented to the city of London, and now decorates one of the great public buildings.

After this, the young painter of warlike scenes chose to try their realities in the field, and accompanied Sir John Moore throughout his disastrous campaign in the Peninsula. He was present at the glorious battle of Corunna, wherein the British, like a stag at bay, turned on their pursuers, and compelled them to retreat. He was present with his gallant commander at the moment of his death; and, on his return to England, Captain Porter published a little volume under the unassuming title of "Letters from Spain and Portugal, during the march under Sir John Moore, by an Officer." The simple truth of the statements contained in that work contributed at the time of its publication to stamp upon it a peculiar value; and a respected place in evidence as a contemporary document, has been awarded it alike by Southey and Napier, historians of somewhat conflicting political sentiments.

Having accidentally touched on the subject of this justly celebrated brother of our authoress, perhaps it may not be unacceptable to our readers to take a glimpse at his biography before resuming our subject.

From the Peninsula, Captain Porter travelled into Russia, where he married an illustrious lady, and settled. He thus became an eye-witness of the burning of Moscow, and the disastrous flight of the army of Napoleon from the ancient capital of the Czars. This enabled Sir Robert to collect materials—many of which, like that of his first volume, were derived from personal observation—for a second historical work, commemorative of the French Emperor's Invasion and Retreat, which he gave to the world with his name on its title-page.

At the termination of the war, he became an *attaché* to the British mission at St Petersburgh, and shortly thereafter commenced his travels into Persia, Kur-

* From the *Western Coronal*, by Mrs Child.

distan, and Babylonia, which occupied him for a space of three years.

Sir Robert and the late Mr Claudius Rich, the British resident at Bagdat, were the two first English travellers that sent home for publication detailed descriptions of the long sought for and so often disputed ruins of Babylon; and to Sir Robert we are indebted as the first who has given correct views of those stupendous remains of antiquity. Besides the general map which he has affixed to his book of travels, he has executed a series of drawings, forming an accurate survey of the entire line of roads from Vlady Caucasus to Shiraz, and thence to Bagdat. These he has hitherto refrained from publishing; but they have been pronounced by persons of judgment and authority who have examined them, as of great importance and value in a military point of view.

Sir Robert does not derive his knighthood from the possession of a foreign order, as many suppose. That honour he received from his late Majesty George the Fourth when Prince Regent; and subsequently he has had the stars and crosses of several foreign orders added to that distinction. His last expedition into remote lands was in following the footsteps of his friend the distinguished Baron Humboldt to South America.

We now return to his interesting sisters, Jane and Anna Maria, both of whom, at the youthful years of sixteen and seventeen respectively, had appeared before the world as authors. The subject of our memoir, who was the elder of the two, made her literary *debut* by the publication of "Thaddeus of Warsaw," a novel, or more strictly speaking, a romance, in four volumes. Considering the time, and the age at which it was written, this cannot fail to be regarded as a very extraordinary work—a great proof of which may be found in its retaining to this day its popularity, after a probation of twenty-seven years. Indeed, our assertion can scarcely be disputed, that this work was probably the very first of the kind, which, blending history and fiction together, introduced them into the same story. This was done with such an air of simple reality and vraisemblance throughout, that by many it has been read as a narrative of actual facts. Indeed we defy scrutiny to point out to us in may parts where the former ends, or the latter begins.

General Gardiner, who was British minister at Warsaw during the calamitous period to Poland, to which the tale relates, has been heard to express his surprise how Miss Porter should have chanced to be at that time resident in that capital without his knowledge of such a fact—not believing that any save an eye-witness could have described what actually happened there, in the manner which characterizes that spirited work. She has received many compliments to the fidelity of her pen from poor dismembered Poland, and amongst the rest a curious gold ring, which was used as a rallying sign among the patriots during their awful struggle for independence. To enhance the value of the gift, it was sent her by a nephew of the celebrated General Kosciusko.

The next essay of Miss Jane Porter as a writer, was our favourite romance, the "Scottish Chiefs;" and, in confirmation of our own sentiments in its praise, we have an ample support not only in its general popularity, but in the valuable testimony which that most competent judge, Miss Joanna Baillie, has borne to its merits in her volume of "Metrical Legends." On its first appearance, it made an almost electrical impression, especially throughout Scotland, and obtained for its gifted author many tributes of regard. Rings and crosses of the tree of Wallace were sent to her from the western counties—on the Continent, and in our colonies, her work obtained every mark of approbation—and from one of the German courts she received an honorary title, as a lady of the chapter of one of its chivalric orders. Both Thaddeus of Warsaw and the Scottish Chiefs have been translated into the German, French, and Italian languages.

Since the appearance of Wallace, Miss Porter has published two small volumes, under the title of "Sir Philip Sydney's Aphorisms," consisting of opinions and sentiments on moral, religious, and political subjects, selected from the various writings of that flower of chivalry, and a work to be considered as a valuable pocket companion to the young and enterprising, as it inculcates a line of conduct which it would be well for them to pursue, nerving them against all the freaks and frowns of fortune, by showing them that vice only is to be feared, and virtue to be sought after.

Our author's next appearance before the tribunal of fame was in the publication of the "Pastor's Fireside," in which, during the Stuart struggle, Duke Wharton and the famous Ripperda of Spain are the principal actors. Although this work lacks the youthful buoyancy and vigour of talent which distinguished its two precursors in the walks of imagination, it contains many striking passages, and some of the characters are well brought out. It obtained for its author the friendship of many high diplomatic characters, both in our own country and abroad, and, like Thaddeus and Wallace, has gone through several editions; all three being still regarded as stock books by the trade.

In the year 1823, she published "Duke Christian of Lunenburgh." The hero is of that branch of the family of Brunswick now in possession of the British throne. It is written in the same free and generous spirit of independence, tempered by genuine loyalty, which distinguishes her former productions, more especially her Scottish Chiefs, and which procured for that work the glory of being denounced to the flames by the Emperor Napoleon, then ruling over France with the tyranny of despotism.

"Duke Christian," however, though thus penned in the true British vein, experienced a widely different treatment from another absolute monarch, the late Emperor of Russia, who, on perusing it, wrote with his own hand a most gratifying letter to its author, and bore his testimony of commendation to her talents, and their application.

Her next publication was a joint production between her sister and herself, in two volumes, entitled "Tales round a Winter Hearth." It is an agreeable collection of stories, to which Miss Jane contributed the one named "Berenice's Pilgrimage," wherein she had an opportunity of making use of some interesting details in her brother's travels in the East.

Her last work, which is in a similar form, came out in 1828, and is in three volumes, of which her portion comprises one.

The "Field of the Forty Footsteps" is founded on an extraordinary legend, relating to a field in the neighbourhood of Bloomsbury, which has since been made the site of the New London University. It has been said that an observation in that story had so powerful an effect on the mind of a person of high talent and influence, as to have been the cause of his first suggesting the establishment of the King's College in London.

Of the portions which Miss Anna Maria Porter contributed to these two works, we need not at present take any particular notice. Meanwhile, we conclude this little memoir of our favourite Miss Jane, by adding that they both reside under the roof of their venerable and excellent mother, who, as we before mentioned, is at the "green old age" of eighty-four, having been born in the memorable year of the Chevalier's rebellion. Their abode is situated in the pleasant village of Exeter, in Surrey, a place celebrated of old by Shakspeare as the favourite country residence of Cardinal Wolsey, and in more recent times by our own poet of nature, Thomson, as one of the loveliest spots in England.*

SCOTTISH DUKES.

ROXBURGHE.

This family, like that of Buccleuch, presents the phenomenon of a predatory knight emerging from the times of turmoil into those of civilization, with large border estates, which, acquiring a sudden value from the changed circumstances of the time, conferred importance and obtained title. The ancestor of the Roxburghe family, little more than two centuries ago, was only Laird of Cessford, or more commonly called *Gudeman o' Halyden*. As a border proprietor, however, he was little inferior to Buccleuch, and he has the superior dignity of a descent from Anglo-Norman lineage. Cessford, the first seat of the family, is a tower within the frontier range of the Cheviots: Halyden is now a lonely unmarked spot near Melrose. The first man of great public eminence was Sir Robert Ker of Cessford, who was born in 1570, and is described in Sir Robert Cary's Memoirs as a brave and active young man. He was a warden of the marches, and distinguished himself so highly in that capacity as to be ennobled, before the year 1600, under the title of Lord Roxburghe. In 1603, he was one of the few Scotch noblemen whom James the Sixth took along with him to England—a circumstance which marks his great personal importance as one of the royal counsellors. In 1616, he was created Earl of Roxburghe, and, in 1637, was made Lord Privy Seal. In the riot which took place, July 23, that year, on occasion of the new liturgy being introduced at St Giles's Church, Edinburgh, his lordship was the means of saving the bishop, by taking him into his coach, and driving him off to Holyrood-house; on which occasion, however, he was only protected by his servants drawing their swords against the populace. The earl acted throughout the civil wars as a royalist, but in a very prudent way, and died peaceably in 1650, in the 80th year of his age. His male issue having died before him, his titles and estates were inherited by his daughter's son, Sir William Drummond, son of the Earl of Perth, who, as required by the entail, married his cousin, Lady Jean Ker, a grandaughter of the earl by one of his sons. The son of this pair, Robert third Earl of Roxburghe, was drowned in 1682, in coming down to Scotland with the Duke of York. What is certainly very remarkable, his countess, who was the eldest daughter of the first Marquis of Tweeddale, survived him in constant widowhood for the long period of seventy-one years, only dying at Broomlands, near Kelso, in 1753. This ancient heiress is said to have been the heroine of the Scottish song called "John Hay's Bonnie Lassie." Her walking-stick is still preserved at Fleurs. Her two sons, Robert and John, enjoyed the title in succession. The latter, in 1707, was created duke, in consideration of his zeal for the Union. He was afterwards secretary of state for Scotland, and made a distinguished figure under the administration of Walpole. The third duke, grandson to this nobleman, was the celebrated bibliomaniac, whose library, on being sold after his death in 1804, realised a prodigious sum. That nobleman never married, having been disappointed in an attachment to the eldest daughter of the Duke of Mecklenburg-Strelitz, whom he had seen on his travels, and who was only prevented from marrying him in consequence of the brilliant destiny of her younger sister, the queen of George the Third. German etiquette forbade this match, it being thought improper that the elder should be a subject of the younger sister. The duke was succeeded by his cousin, Lord Bellenden, who died next year. The title and estates then devolved, after a tedious law-plea, upon Sir James Innes Ker, descended from a daughter of Lord Hary, the son of the first earl.

* Abridged from the Edinburgh Literary Gazette, 1829.

RECOLLECTIONS OF MY GREAT-GRANDMOTHER.

My great-grandmother was not of a cynical or austere disposition, but rather cheerful, talkative, and benevolent. In this, I must confess, she differed from many other old Scottish ladies of her time, whose character, in general, displayed a very bitter rind. But it could be accounted for, on the supposition that all the natural affections of her heart had been developed and brought into action by her numerous domestic relations, and had not again been chilled or soured by accidental circumstances. Fortunately for me, in all our intercourse she was uniformly kind and communicative.

The three months which I spent with her ladyship, previous to engaging in the unsentimental horrors of the High School, were assuredly the most pleasant of my life. They were almost altogether devoted by us both to my initiation in all the mysterious family secrets of my ancestry, to her relations of which my juvenile curiosity ever inclined a willing and ready ear. My great-grandmother's memory reached back quite distinctly to the era of the Union, when she was a girl of eight years of age, and she preserved all the more remote reminiscences of her father, who had been in public life a short while after the Restoration. She had anecdotes at third hand of the Civil Wars, and even a few shadowy outlines of the time of James the Sixth. From her husband, who held a high judicial office in the reign of George the First, she had derived many interesting anecdotes of the government of Scotland, from the Union downwards; and from her early female acquaintance, she had picked up as much legendary scandal of the latter end of the seventeenth century, as is perhaps at this moment afloat respecting the whole world of our own day. All these traditionary stores were faithfully committed to my memory, which thus became encumbered with many unintelligible, but yet distinctly impressed pictures, of which the real meaning has only since dawned upon me gradually, as I grew up, and as I happened to find them illustrated in the course of historical researches.

Imagine the delicious dreams of romance in which I thus indulged. I was raw from my country castle, where a venerable copy of Buchanan's Scotland, with portraits of the Roberts and the Jameses (almost my only reading), had given my mind a decided turn for retrospective contemplation, and where my other great-grandmother's ballads had tinged my whole soul with the brilliant hues of romance. My temperament was naturally lively and fanciful, and here, placed in very contact with one who had herself seen an age of something like chivalry, and been in the presence of others who had almost seen it in its vigour, I felt as if I lived a century before my time, and moved amidst the awful ghosts of those whom I had ever been accustomed to think of as the heroes of an inconceivably glorious age, long passed from mortal ken.

This passion—for in me it amounted to such—was fed in no small degree by my great-grandmother taking me to visit many of the real scenes of her stories, which were neither more nor less than the streets, closes, and houses of the Old Town of Edinburgh. This very curious and wonderful place, of which she preserved innumerable local anecdotes, always filled me with a sort of awe. The first *close* I ever entered was that memorable one in which the old Episcopal chapel was situated, where the narrowness of the passage, its tortuosity, the stupendous height of the buildings on both sides, their black and antique appearance, the religious rubrics here and there interspersed, and the projections above, which scarcely left an inch of sky in view of a spectator from the bottom, overwhelmed me with an indefinable feeling of more than admiration. My great-grandmother, in time, and as her increasing infirmities would permit, walked with me through many such, and pointed out what had in her early days been the residences of the noble and the wealthy, and were now reduced, by the change of manners and fashions, to accommodate only the mechanic and the poor. There was scarcely a *close* of which she could not tell some strange traditionary anecdote. She once pointed out a recess in a *court* somewhere behind the Lawnmarket, where, when a

girl, she had one night seen two gentlemen fight each other with swords, for a good while, till one of them fell, and the other fled. "We were all horror-struck," she said; "for there happened to be no man person in the house to go out and part them, except the livery laddie, that wadna steer frae the kitchen-neuk; but, hearing the groans of the wounded gentleman, we ladies went down stairs in a body, with candles, and found him dead, for the sword had gone quite through his back, and the gutter ran with blood down (as we afterwards heard) to the very North Loch. He was a lord's son, and there was a feud about him between his family and somebody that was blamed for his death, many a long day after. Never shall I forget that night—there's the very step, outside of that stair-fit, that his head was lying on, wi' its lang curled hair and thrawn white face, when we came down and saw him!" As I shuddered at this fearful sketch of past times, and gazed on the localities with a strange and thrilling interest, she pulled me away with her stout bony arm, calling me, in her old homely phrase, a "daft callant," though I know she was in secret immensely pleased at the attention which I paid to her stories.

I was greatly struck one day, in the course of a tour through some very antique and ruinous places, when her ladyship happened to stumble upon the house in which, at a ball, she had fallen in love with her husband. It was a good way up stairs, and so mean-looking an abode, that I could not imagine the possibility of its ever having been the scene of fashionable revels. On ascending to the proper height, we entered a lobby, of which the walls were coloured with a blotched and dirty white, and begrimed all around. From this several doors and passages branched off; and it was evident that each of these doors gave entrance to the habitation of a separate family. Her ladyship was at first puzzled how to proceed, for, though in her youth she had been quite familiar with the house, it now appeared that the internal arrangements had been altered, and many subdivisions had taken place, so that the original apartments could scarcely be recognised. One thing she was quite clear upon, and that was, that the dancing-room had windows which overlooked the North Loch, "for I mind," said she, "after I had danced the first dance with my dear lord, he handed me to a seat in the neuk o' the window, and there sat gently down beside me. I looked ower to Bareford's Parks (for it was a simmer evening, and not dark), pretendin', wi' my tale, no to heed him, but to be quite ta'en up wi' the bits o' innocent lambs that were a' daunderin' about the place, where there's naething noo but a big starin' New Toon, as they ca't, fu' o' wylie-tod writers. And my lord observed me looking at the lambs—oh, he was a pleasant man, and then very young, and new put on the bench; yet he was grave and learned beyond his years; and it ill set a man o' his character and profession to speak silly things to a silly lassie, that had naething but vanity and nonsense in her head. However, he was sae anxious to please me, that he began and spak some havers about innocence, and pastoral life, and the sweetness o' thae bonny creatures that I saw ower the Loch. Now, I wasna thinkin' at a' about either ae thing or anither a' the time but himsell, and was just in a kind o' reverie about him indeed; but at last, hearin' him speak about the *sweetness* o' the lambs, and seein' him point out a particular ane, that looked very plump and happy, I was obliged to muster up some answer to his lordship, and, in my confusion, what d'ye think I said, Sandy? Man, I drew a lang breath, and said, 'Yes, my lord, I daresay that ane wad mak' a very sweet *lamb pie!*' My Arcadian swain was quite dumbfounded, and I heard him ejaculate, 'Oh, Lord!' in a kind o' horror. But I soon brought him about again, and matters a' proceeded gaily eneugh for a few months, when we were happily married."

We proceeded to explore one of the dark passages before us, and knocking at a door, which was opened by a little girl, entered a small apartment with one window, which in reality did command a view of the New Town. Upon our entrance, an aged spectacled dame, in coarse but clean clothes, rose from a table at which she appeared to be reading a large Family Bible, and coming forward, respectfully inquired our business. My great-grandmother, apologizing for our intrusion, briefly stated that curiosity respecting this very remarkable old house, which had been the habitation of some of her best and earliest friends, was the sole occasion of our visit, and expressed a hope that the few moments of our stay would not put her to much inconvenience. The woman, who seemed to be the retired servant of some person of rank, replied, in very polite terms, that we were exceedingly welcome to gratify our curiosity, and even proceeded to *chaperone* us round the apartment, of which the roof and cornices, as she showed us, were ornamented with curious stucco-work. But my great-grandmother expressed little curiosity respecting these, which she declared to be modern-antiques, and begged to be allowed to sit a few moments in the recess of the window, which she recognised to be that through which she had seen the lambs of Bareford's Parks. A chair being placed, her ladyship sat down with feelings evidently not a little excited, while the old woman retired to the other end of the room, and I stood silent at a little distance, in expectation of her remarks upon the scene.

"Yes, yes, Alexander," said she, "this is the very window I spoke of; for, in this thick old pane, I see—what I remember having then seen—the name of my school-acquaintance, the Hon. George ——, who was the second son of the noble proprietor of this house. A gallant young man he was, and was killed in a duel at Leyden, when studying there for the Scots bar. Here sat I, seventy-four years ago, a light lassie o' sixteen, wi' the bloom on my cheek and pride in my heart; and there sat my future husband, your great-grandfather, Lord Kittleghame, that has been in his grave sin' the year twenty-nine. Little did I then think of sitting here again at this time of day, an auld wife, with a great-grandchild by my side, and sic a changed warld a' round me. Gin Thomas the Rhymer himsell had told me what was to come to pass, I wad have ca'd him a haverin fool. But naebody can imagine strange enough things for futurity no to bring about. There's that New Town, that naebody thought would ever be a town at all—ye see, it's half a mile lang already, and may be a hale ane or they be done wi't. Nay, they're maybe born that shall see it ta'en down to the sea, and even ower to Fife, nae sayin'; and then the Frith of Forth will be a kind o' new North Loch for them to mak' briggs ower. Speakin' o' the Nor' Loch, there was a story told i' my day, that a poor old woman once attempted to drown herself in it, but was prevented in a very singular way. She waded in a gay bit, till her large wide stiff hoop, being buoyed up by the water, carried her off her feet, and then the wind blew her away across the Loch, quite safe and erect, but cryin' a' the time for help; and when she landed on the other side, she was completely reconceeled to life, and it is said she lived with her family for many years after, though she never got another name till her deein' day, but *Nor' Loch Tibbie.*

"But that's no to the point," continued my great-grandmother, looking round the room, and surveying its humble furniture. "To think o' this house, that was ance the entailed property and residence of Lord ——, and was said to have been built for a town-house to his ancestor the Regent ——, being now such a wretched abode! It is dreadful. Ah, the many gay and grand sights that I have seen here! This was a large room then, and the panels were a' covered with beautiful paintings and mirrors. I have seen country dances here, with six-and-thirty couples in them. A' the nobility o' the town used to come, and ladies with such hoops, that they could not stand closer to each other than at arm's length, while their heads were dressed up like the very Tower o' Babel itsell. My troth, dress was dress in thae days! There was a band o' musicians at that end—violin players, amateur and professional, without number, with the ingenious MacGibbon on the hautboy, and the lively-fingered Crumbden on the harpsichord. Some gentlemen of birth and fortune, between the dances, entertained the company with gratuitous performances on their own favourite instruments, accompanied by ladies who could sing. There was Mr Falconer of Phesdo on the flute, Mr Seton of Pitmeddin on the violin, and Mr Chrystie of Newhall on the viol de gambo; and as for ladies, there were some of Crumbden's pupils, whose very granddaughters have, to this day, a finer hand upon the harpsichord than others. No such agreeable gentlemen or ladies now-a-days, nor such music neither! There were naething then in vogue but gude auld Scots airs, such as *Gilderoy, I'll never leave thee—She rose and let me in,* and *The bridegroom grat,* which were a' played in as simple a style as when they were first uttered by their shepherd-authors on the mountain side. Miss Baillie of Jarviswood, afterwards Lady Murray of Stanhope—though her father was a Whig, I maun do her justice in this—she sung the plaintive sang of Tweedside—not the new-fangled lad Crawford's version, but my Lord Yester's—in so sweet and touching a manner, that aye when she came to the last line o' the verse, 'I'll lay my banes far frae the Tweed,' the hale company shed tears; and indeed naebody could bear to hear her sing it, for they were sae sure of making fools of themselves before it was done. She was certainly a sweet creature, Lady Murray, and could write fine sangs hersell; we were always on good terms, and used to criticise each other's verses with great good humour. She was ill-set wi' Sir Alexander, who was quite mad. She once told me, that the first of their unhappy quarrels took place three or four days after they were married—it was i' the year ten, and that makes me an auld woman. They came to live in the Parliament Square, which was not then altogether rebuilt after the great fire o' the year naething: and upon Lady Murray expressing some uneasiness at the disturbance occasioned by the sound o' the masons' hammers i' the morning before rising, Sir Alexander told her that it was a very pleasant sound, and that she must just endeavour to think it so, else there would be nae peace between them. Was na that fine treatment for a young wife i' the hinneymoon? But I'm wanderin', as usual, frae the point. Ay, ay, I was describing the entertainments gien at balls in thae days. However, I see we're just disturbing this good woman, and it is time we were hame at Teviot Row, to prepare for the ladies I expect to-night to tea and cards."

She rose, and moved into the centre of the apartment, when, as she stood a few moments in conversation with the old woman of the house, I could not help contrasting in idea her tall, antique, faded figure, half stooping over her black square-headed cane, and surrounded by the humble furniture of a poor dwelling, with the bewitching loveliness and stately graces which were ascribed to her person in youth, when she moved here, the centre of a whole system of animated beauties, now long forgotten in the dust, and giving additional charms to a scene of magnificent festivity.

> She seem'd like one who treads alone
> Some banquet-hall deserted,
> Whose lights are fled, whose garlands dead,
> And all but she departed.

The old woman soon getting into the full tide of gossip with my venerable relation, we were detained a few minutes, during which it turned out, that this aged person had been head-servant to the noble family who formerly possessed this mansion, and now lived retired in one of its garrets, upon a small pension allowed to her by one of its members, who had survived with life and fortune the wrecking period of the *Forty-five.* She seemed a complete specimen of the old Scottish domestic—attached, garrulous, and polite. She had a formality in her manner, which went far beyond the utmost limits of modern good breeding, and, though miserably infirm, was not without a certain degree of stateliness in her personal appearance. She was dressed with remarkable neatness, and wore a necklace of *lammer beads,* to which a small crucifix of gold was attached. What rendered her at once interesting in my romantic eyes, she had been wounded, in the year 1745, by a shot from the castle, directed at the coach of her rebellious master, in which she was, when it entered the city, in broad day, by the West Port, then in possession of a Highland guard; and she could tell many anecdotes of that year, so remarkable for having heard the last faint trumpet-note of aspiring chivalry. She had entered the service of the —— family when she was a girl; had lived many happy years with them in this then splendid house, previous to that unhappy occasion: after which, she accompanied them abroad, saw them all die out, one by one, with broken hearts and ruined fortunes, and then returned to end her own days amidst the ruins of their former abode. My great-grandmother asked many questions respecting the family, which the old woman could not answer, except at great length and with tears. There was only one anecdote of a ludicrous nature, and that respected the preservation of her present supporter, who was a nephew of the last lord, and now enjoyed part of his estates. Lady —— was very averse to her husband's design of joining the rebels, and when his nephew came to Edinburgh to accompany him away, ordered her maid to put boiling water into his lordship's boots, so that, when he came to draw them on, he might incapacitate at least one foot for the expedition. By mistake, the maid bestowed the boiling water upon the nephew's boots, which stood in the kitchen beside her master's; and the consequence was, that, while his lordship went away laughing at his nephew's misfortune, the young gentleman remained at home, escaped the perils of the rebellion, and afterwards inherited some of the possessions which his brave uncle forfeited. Many other anecdotes we heard; but my great-grandmother at last took her leave, promising that I should call some future day, with a token of her regard, and in order that I might hear out the rest of her interesting stories.

SPENDING MONEY.

It is inconceivable what a deal of money is thrown away by young people in what are called "trifling sums"—in shillings, sixpences, threepences, and even pennies. A great deal more, indeed, is expended by them in this small way, than in sums of a larger amount; mostly, too, in a way that tends to no real good, generally on mere superfluities, things which might, by the least possible exertion of self-denial, be dispensed with, and never missed. This remark applies more especially to that class of youths familiarly recognised as "young men about town," who, with two or three spare hours per day on their hands, and two or three spare shillings at all times in their pockets, are in a manner beguiled into the practice of spending money by way of pastime. We do not here allude to those who have been born to a competency, although even these will not, we think, be the worse of attending to us for a few minutes. Our remarks are meant for the other, and by far the larger portion of the rising generation, who, by inheritance or otherwise, have just sufficient to give them a good education, and put them in a "respectable way of doing."

Spending money uselessly, is, in some, merely a bad habit; in others, it is a matter of *vanity.* In all, however, it originally proceeds chiefly from thoughtlessness and want of calculation as to the amount of all the little items spent when added together, and how deeply, though almost imperceptibly, they eat into the amount of their annual receipts. The sums, viewed separately, appear so very insignificant! And as to looking at them in the aggregate, that is never attempted; for who could have patience to keep an account of all the odd pence, threepences, sixpences, and shillings, expended from day to day, in all varie-

ties of ways, for a whole twelvemonth? The time thus employed would be a greater waste than the money spent! It is thus, however, that many a young man, who is in the habit of receiving his earnings in that pernicious and deceitful way of "just as he might need them," finds himself perfectly confounded on discovering, at the twelvemonth's end, that he had not only overdrawn his due, but had not a penny laid by to answer the obligations which then came to be liquidated. After the first pause of surprise, he begins to comfort himself with the suspicion that there *must* be an error *somewhere* in the accounts either *pro* or *con*. He examines every item individually with a nervous and irritable impatience; adds them together, first upwards and then downwards; but, alas! his skill in the science of notation avails him nothing; the quotient still comes out the same, with most unsympathising accuracy. How could this possibly happen? And then he proceeds to review his mode of living—possibly with some degree of self-approbation. His fare has been uniformly frugal, his lodgings cheap, and he is addicted to no dissipated or expensive habits. He may perhaps recollect of treating himself to various luxuries; but still every thing added together does not come within L.10 or L.12 of the deficit; and these L.10 or L.12 would just clear off his tailor's and shoemaker's bills, and make him a free man. How so much money could have slipped through his fingers, he is utterly at a loss to conceive; he entirely forgets all the odd threepences, sixpences, and shillings, thrown away in the manner we have alluded to; or, if a vague recollection of a few such things does come athwart him, he rejects the idea of their having occasioned so large a deficit as an utter impossibility. There, however, it stares him in the face, and must be made up. His heart sinks within him, and he experiences that (when felt for the first time) perhaps most intolerable and oppressive of all human sensations—the consciousness of being in debt. This is a perilous moment in his career. There is nothing so apt to crush the buoyant spirit of a young man of sensitive feelings to the very earth, or drive him into excess, as this first torturing feeling of being at the mercy of another—a debtor. The parents, guardians, or other wellwishers of a young man, who has thus, through folly, thoughtlessness, or even a temporary lapse into dissipation, placed himself in such a predicament, would do well to get him extricated from it as speedily as possible. Lay what restrictions they will on him afterwards—although, even in them, regard must be paid to the temper and disposition to be operated on, and that they be laid on less as a punishment for the past, than a precaution against future errors; but, as they wish him well, let them draw him back from the edge of the abyss in the meantime. He is far more likely to set about a reformation of any evil habit with resolution and effect, when unoppressed with the harassing consequences of his former indiscretion. Besides, his good resolves are quickened and kept alive by the glowing feeling of gratitude he cherishes towards his succourer, whose good opinion he will fear to lose by a second act of folly.

In the catalogue of human follies, there is none for which the instructors of youth ought to impress a greater abhorrence on the minds of their pupils, than—getting in debt. But if the mischief be already to a certain extent committed, the next object ought decidedly to be—how to remedy it. There are many young men, naturally of the best dispositions and moral habits, in a manner driven into the broad path by an ill-judged over-severity and illiberality being practised towards them. Let us not be supposed for a moment as trying to palliate the follies of youth; quite the reverse. But there never was a saying of more practical wisdom than that of the late Dr Gregory, that "it is impossible to place old heads on young shoulders;" and he who thinks, by means of sheer coercion and threats, to instil into sixteen the gravity and solidity of sixty, had needs beware that he does not either altogether extinguish the spirit he seeks, but to moderate or excite it into a fiercer blaze.

Your spender from *vanity*, again, is a less hopeful, and altogether less interesting character than the foregoing. His folly is more systematic, more selfish—for vanity and selfishness are always concomitant—and when once fairly into the stream, his besetting sin will deter him from making any effort to retrieve himself. He will suffer any private inconvenience, and resolutely shut his heart against the importunities of a *dun*, rather than abate one jot of the showiness of his exterior, or abridge any one of his habitual ostentatious indulgences. Thus do we daily see hundreds of "genteel young men," in the principal walks of our city, who, by their air, think themselves the very lords paramount of creation, and yet are shamefully and senselessly spending money they never gained, and never had the wit to gain—squandering upon momentary and dishonourable gratifications an endless succession of what they consider "small sums"—that is to say, sowing upon the winds, to be never again reaped, what, if husbanded with moderate economy, might in larger forms have added to their real dignity, and perhaps their prosperity in life. Thousands thus live without ever acquiring the reputation they perhaps aim at—that of being thought in high circumstances; while others, who spend seldomer, but to better purpose, get a good character for a fifth of the money. There is no branch of domestic life where we see men so far behind in general, as in the art of spending. For our own part, we have an absolute horror at calls for little sums, and can disburse pounds with unconcern, when we would hesitate very much about sixpences. We know very well that large sums cannot be often spent without speaking for themselves; but this insidious system of twopences—it is like making a man perspire to death, without his ever knowing what is the matter with him. Truly might Poor Richard say, Take care of your pence, and the pounds will take care of themselves.

We have often thought, that, if the habitual small spenders had some mental ready reckoner, to show them, at a thought, and without putting them to the trouble of using "black and white" in the matter, the consequences of all these little spendings, and the amount they run up to in a twelvemonth, they would often replace the half-drawn-out coin in their pocket, and have the satisfaction of reflecting, after the moment of temptation is past, that they are so much the richer. For instance, if they had an Arithmetical Mentor, that would quietly hint to them, when about to throw away sixpences on some superfluity, that that sum per day is just L.9, 2s. 6d. a-year, if fourpence, L.6, 1s. 8d., or, say threepence-halfpenny, L.5, 6s. 5½d., the loose copper and sixpences which appeared so trifling would assume an importance they little dreamt of before. It is for the purpose of supplying such a *desideratum* that we began this article. The mental calculation by which it is done is novel and curious, and the very ingenuity of it sufficient to entice the mind to its exercise.

It is thus:—

Set down the pence spent per day—say sixpence—as pounds per year -	L.6	0	0
To that add a half - - - - -	3	0	0
These sums added together, show what 6d. per day comes to in 360 days, viz. -	9	0	0
To which, of course, falls to be added five sixpences for the five remaining days to complete the year—or - - - -	0	2	6
So that sixpence spent per day is just per year - - - - - - -	L.9	2	6
Or let us suppose 1s. per day:—			
Twelve pence is - - - - -	L.12	0	0
A half is - - - - - - -	6	0	0
And the shillings for the five odd days is, of course, just - -	0	5	0
Amount per year - - -	L.18	5	0

The principle of this convenient rule is perfectly simple and intelligible. It proceeds thus—that as there are just 240 pence in a pound, a penny per day for 240 days must just amount to that sum. If to it be added a half, or the pennies for 120 days, it brings out the amount for 360 days, or within five days of a year. The number of pence for these odd five days are, of course, easily added.

We hope this is a sufficiently simple explanation of the principle of our "Arithmetical Mentor," which, it will be seen, may be found useful in more ways, and by many other descriptions of persons besides those for whose benefit we specially intend it—such as calculating the amount of limited pensions, half-pay, labourers' wages, &c. for a twelvemonth; which, although very well known, perhaps, to the individuals giving and receiving, may not, at first sight, be equally apparent to others. The principle, indeed, may be extended to any length; but we have, in the above, stated enough for our present purpose. By putting the foregoing rule religiously in requisition, whenever a fit of spending assails him, many a young man may not only keep clear of debt, but, by abridging only a few habitual frivolous indulgences, have a surplus for laying out in a rational way when required—to say nothing of the wholesome exercise of his mental faculties in the process of calculation.

CAPTAIN FRANKLIN'S EXPEDITION TO THE POLAR SEA, IN 1819, 1820, 1821.*

While Parry was exploring a passage across the Polar Sea towards the Pacific Ocean, in order to determine the character of the extreme northern coasts of the continent of America, Captain Franklin was appointed to ascertain the actual position of the mouth of the Copper-mine River, and the trending of the shores of the Polar Sea to the eastward of it. The Copper-mine River flows into the sea at a part of the shore west from the undiscovered tract; and it was, therefore, for the purpose of completing the knowledge of the sea line eastward to Hudson's Bay, or some other inlet of the Atlantic, that this expedition was undertaken. Franklin was accompanied by Dr Richardson, a naval surgeon well skilled in natural history, Mr Hood, and Mr Back, two Admiralty midshipmen, and by two steady English seamen. This little party embarked on the 23d of May 1819; and, after engaging four boatmen at Stromness to assist their progress up the rivers of America, they arrived at York Factory, on the shoes of Hudson's Bay, on the 30th of August. On the 9th of September, the party proceeded on their journey from York Factory, sailing up a river leading to Lake Winnipeg, and from thence, by another river tributary to that lake, to Cumberland House. This place is situated in a central part of the North American continent. The object was now to proceed directly northward, on a long and perilous expedition towards Fort Chepeywan, which is another well-known point in this dreary waste. The part of the world through which the travellers were now proceeding, is, both in superficial character and population, nearly a wilderness, being one wide-extended waste of snows, thinly inhabited by straggling Indians, who live by serving the purposes of the Fur Companies. Hardly any thing but the noble desire of gaining fame, by adding to the stock of human knowledge, could have sustained a party of Europeans, travelling in so dismal a country, where the thermometer is frequently at 40° and even 50° below zero, and locomotion is only to be accomplished with the utmost pain and difficulty.

With the view of reaching Fort Chepeywan, Captain Franklin and Lieutenant Back set out on the 18th of January 1820, leaving Dr Richardson and Mr Hood to bring up their baggage in the spring. The object of this perilous winter journey was to prevent delay at Chepeywan, in the preparations necessary for their ulterior proceedings. Travelling at this season, and in this dreary territory, can only be performed on sledges by dogs, or by walking in snow shoes. The settlers attach to the former a covering of leather to protect the lower part of the body, and when "beautified" with a little paint and a few trifling ornaments, the sledge assumes the name of *cariole*. Every traveller takes care to supply himself with a pair of snow-shoes, a blanket, hatchet, steel, flint, and tinder, and generally with fire-arms. In mounting his cariole, he puts on a *capot*, or large skin cloak with a hood, a fur cap, leathern trousers and Indian stockings and mocassins. Three dogs will draw a weight, besides that of the sledge, of three hundred pounds, at the rate of two miles and a half an hour, or about fifteen miles a-day, when the snow is hard frozen. To the inexperienced, the suffering occasioned by walking in snow-shoes appears to be dreadful, and, as Captain Franklin says, "can be but faintly imagined by a person who thinks upon the inconvenience of marching with a weight of between two and three pounds constantly attached to galled feet and swelled ankles." This mode of travelling is feelingly described by Lieutenant Hood:—"The miseries endured during the first journey of this nature are so great, that nothing could induce the sufferer to undertake a second, while under the influence of present pain. He feels his frame crushed by unaccountable pressure, he drags a galling and stubborn weight at his feet, and his track is marked with blood. The dazzling scene around him affords no rest to his eye, no object to divert his attention from his own agonizing sensations. When he rises from sleep, half his body seems dead, till quickened into feeling by the irritation of his sores. But, fortunately for him, no evil makes an impression so evanescent as pain. It cannot be wholly banished, nor recalled with the force of reality, by any act of the mind, either to affect our determination, or to sympathize with another. The traveller soon forgets his sufferings, and at every future journey their recurrence is attended with diminished acuteness."

On halting for the night, the first operation, in the Canadian phrase, is that of "flooring the hut." It consists in clearing away the snow, and covering the ground with pine branches, upon which the travellers spread their blankets, skins, cloaks, and coats. The sleeping place being thus arranged, the next step is to send out parties to collect a sufficiency of wood to serve as fuel for the night; the fire is then allowed to be kindled, the sledges are unstowed, the dogs unharnessed, and the provisions hung upon the trees, out of the reach of these voracious animals. Supper is then cooked; the Canadian voyagers amuse themselves by singing and recounting their former adventures; they then coil round the fire in the centre with their feet towards it, the dogs creep in among them wherever they can find a vacancy, receiving and communicating heat, and thus the whole party "enjoy a sound and comfortable repose, without any other canopy than the heavens, even though the thermometer should be far below zero.

In journeys thus performed, the danger of the traveller is not so great from the severity of the cold as from the risk of perishing for want of food. The servants of the North-West Company are frequently obliged to set out in search of the hunting parties of Indians, to receive the furs which they may have collected. A snow-storm arises, they lose all traces of them, miss their way, and are very often driven to the last resource of killing their dogs for food. The Indians themselves are frequently reduced to the last extremity, and even to death, by famine.

Notwithstanding all dangers and distresses, Franklin and Back arrived safely at Fort Chepeywan on the 26th of March, and some weeks thereafter were joined by Richardson and Hood, who had experienced equal annoyances in the spring, from the flights of stinging insects which beset their path. The whole party, with their Indian hunters, set out on the 18th of July for the northward, in the hope that, before the season should expire, they might be enabled to fix their winter quarters at the mouth of the Copper-mine River, and to avail themselves of the earliest period of the following spring to explore the coast of the Polar Sea to the eastward. But so great and so numerous were the difficulties experienced from the

* This article is reduced from the abstract of Captain Franklin's work in the Quarterly Review.

scarcity of provisions, and from the impediments in the navigation of the numerous rivers and lakes, on account of the rapids of the one and the shallows of the other, together with the frequent portages, that their progress was exceedingly slow and tedious; and they did not arrive at the spot where it was found necessary to hut themselves for the winter, and which was distant from Chepeywan about 550 miles, before the 20th of August. With regard to the interruptions from the portages, or land-ferries, as they might be called, they became more frequent, and the dragging of the boats more fatiguing, in proportion as they advanced to the northward; and thus the sufferings of the people from want of sufficient sustenance were greatly aggravated. It not unfrequently happened that in one day they had to load and unload the canoes and to transport them and the baggage over five or six of these portages.

Captain Franklin, finding it now too late to proceed to the mouth of the Copper-mine River, was obliged to winter at this spot; and, in the meantime, Mr Back, with a small party, had to return all the way to Chepeywan for further provisions and necessaries, which he did not return with till the 17th March next year. It was not till the 14th of June that the Indians considered the ice to have sufficiently broken up in the Copper-mine River, to admit of its being navigated by canoes. By this time their stock of provisions was pretty nearly exhausted, and it became evident that their future subsistence must depend on the success of the hunters, as they proceeded down the river; these hunters, however, as the time of departure approached, began to manifest a decided reluctance to proceed.

At length, all difficulties being surmounted, the whole party proceeded to the Copper-mine River, which, like all those which they had hitherto navigated, was full of rocks, rapids, and shoals, and in many places bridged with large masses of ice. The grassy plains on either side, however, abounded with game, particularly with that singular little animal known by the name of the musk ox, of which they killed a great number, but all of them lean, and the flesh by no means palatable.

About the middle of the ensuing month, the party reached the bottom of the river, and had a view of the Polar Sea, which, however, alarmed some of them a good deal, as it was now necessary to trust themselves to it, while they explored their way eastwards. The idea of launching upon an icy sea in slender bark canoes—the roughness of the water—the uncertainty of procuring provisions—the exposure to cold, where no fuel could be expected—produced despondency in all except John Hepburn, a sailor, to whom the sea was as an old friend, from whom he had been long estranged. In truth, when it is stated, that, at the advanced period of the 21st of July, twenty people, of whom fifteen had never seen salt water, launched upon the rough and chilly Hyperborean Ocean, in two miserable birch-bark canoes, with no more provision of all kinds than fifteen days' consumption, and with a voyage before them of not less than twelve hundred geographical miles (Fort Churchill being the very nearest spot at which they could hope to meet with a civilized human being), our readers may in some degree appreciate that a little alarm is not to be wondered at. Captain Franklin had, it is true, some faint hope of meeting with tribes of Esquimaux along the coast, with whom he might, if necessary, pass the winter; but not a human creature was seen, though the vestiges of habitations were occasionally visible.

By this voyage, Franklin added the coast of the Polar Sea, from longitude 115 to 107 W., to the stock of geographical knowledge, and increased the probability of a connection between the ocean in this direction and the branches of it already explored in connection with Hudson's and Baffin's Bays. The winter again approaching, it was found necessary to strike across the country towards Fort Enterprise, the nearest station of the North-West Fur Company, to which they had previously dispatched Mr Wentzel, to lay in provisions.

On the 5th of September, three days after commencing the land part of this journey, the party was surprised by the unusual and unexpected appearance of winter, in a heavy fall of snow. From this moment till the 26th of the month, three tedious weeks, they had to struggle against cold and boisterous weather; to walk through snow sometimes two feet deep, over a country which scarcely produced a shrub for fuel above six inches high; and to guess their way across an unknown land, unassisted by celestial observations (the sun being constantly hid except on two occasions): and, to add to their misery, they had before them the appalling sight of musk oxen, deer, and every other animal, and even the water fowl (alarmed at the snow), hurrying to the southward with the utmost speed. In this journey of twenty-one days, all the fresh meat which they could procure amounted only to five days' consumption; the sole resource for the rest of the time being the *tripe de roche*, a species of lichen which grows on the rocks: even this weed, unpalatable as it was, could not always be found, so that one scanty meal a-day was sometimes all that could be afforded, and several days were passed without eating at all.

The labours of the party, in dragging their burdens and themselves through the snow, did not end with the day. Though they had no food to prepare, it was absolutely necessary to have some little fire to thaw their frozen shoes at night; and it was no easy task to find and dig from under the snow a sufficient quantity of stunted bushes for this purpose. The fatigue and want of food had a very sensible effect on the strength and spirits of the Canadian voyageurs, both of which were painfully noticed to be sinking very rapidly; yet, encouraged by the officers, they endured, for a time, their miseries with as much patience as could be expected. At length, however, on finding the line of their route interrupted by frequent lakes, which required them to make circuitous journeys, and seeing no hope of speedily reaching their destined point, they began to despair of their safety, and, becoming alike indifferent to promises or threats, seemed to consider themselves as liberated from all control. To add to the misery which stared them in the face, one of the canoes was rendered useless by an accident, and soon after, through the inattention and insubordination of some of the party, the other was also dashed in pieces, though those who carried it knew, from the course of the Copper-mine River, that it would be essentially necessary to enable them to cross it.

On the 26th September, the whole party arrived on the banks of this river, and having killed five small deer, began to congratulate themselves on their good fortune in having procured as much fresh meat as, with due care, would serve them till their arrival at Fort Enterprise. The weather, too, had become mild, and the Canadians considered their misfortunes at an end; but, alas! they had not yet begun. In the midst of their joy they forgot, that, in their madness, they had deprived themselves of the only means of crossing the river which lay between them and the place of their destination. The shores of Point Lake were searched in vain for pines to make a raft. The next expedient was to collect fagots of dried willows, and with those to frame a sort of float; but this was found an unmanageable machine in a stream without the assistance of oars or poles. In short, eight whole days, mostly of fine weather (and the only fine weather they had) were consumed in devising means for crossing the Copper-mine River.

In this hopeless condition, with certain starvation staring them in the face, Dr Richardson, actuated by the noble desire of making a last effort for the safety of the party, undertook the hazardous enterprise of swimming across the stream (about 130 yards) with a line attached to his body, at a time when the mercury in the thermometer stood, in the air, below the freezing point, and in the water at 38°. He succeeded in reaching very nearly the opposite bank, when, benumbed with cold, he lost the power of moving his limbs, and was observed by his anxious companions to disappear beneath the surface. It may easily be imagined what their feelings were at this moment. They eagerly dragged him back by the line, and drew him out of the water with little or no hope of restoring animation. By wrapping the body in blankets, however, rubbing it, and laying it before a fire, he was at length restored to life, but, as might be supposed, remained for some time in a very enfeebled state.

No other person of the party could be found to repeat the experiment; but a kind of basket was at length constructed, which, when covered over with a few fragments of canvass they had luckily preserved, it was hoped might enable them to pass the river; but it was capable only of holding one person. In this basket, Percy St Germain, one of the interpreters, first volunteered to paddle over, carrying with him a line, and happily he succeeded; it was then drawn back, and a second crossed, and so on till the whole party had crossed over without any serious accident, though their frail vessel was filled with water at every traverse, and generally sunk before it reached the shore.

It was now the 4th of October, and they were within forty miles of Fort Enterprise; but the weather had again resumed its severity, the ground was covered with snow, the last morsel of their food was expended, and the whole party miserably reduced, by their recent scanty fare, and their exertions in crossing the river. Under these circumstances, Captain Franklin deemed it expedient to push forward Mr Back with three of the voyageurs in search of the Indians, who, it was hoped, would be found in the neighbourhood of Fort Enterprise. The following day the remainder moved forwards, and procured a meal of the tripe de roche, which produced, however, such distressing complaints on some of the party, and reduced them to such a state of weakness, as to oblige them to leave every thing except their personal baggage; and even with this, two of the people dropped behind, about the middle of the second day's march, utterly unable to proceed. Dr Richardson, weak as he was from his late exertion, went back in search of these two unfortunate men. He found one of them, at the distance of a mile and a half, lying exhausted in the snow, talking incoherently, and evidently in a dying state; but of the other he could discover no trace. On returning with this information, a halt was made, a fire kindled with a few stunted willows, and every argument used to induce the ablest of the party to endeavour to bring forward the poor man who had fallen, and renew the search for the other; but they all declared their utter inability; and, revolting as it was felt to humanity, both were of necessity abandoned to their fate.

As there was every reason to fear that others of the party would speedily sink under the combined pressure of famine, fatigue, and inclement weather, and as those who were strongest had renewed their threats of throwing down their loads, and pushing with their utmost speed for Fort Enterprise, though they knew not a foot of the way, Dr Richardson and Mr Hood generously proposed to halt at the first place that offered a supply of fire-wood, and, with the weak and worn-down of the party, to remain there till assistance should be sent to them from the fort. To this arrangement Captain Franklin reluctantly consented; but as he had every reason to hope that he should find a depôt of provisions at Fort Enterprise, and a band of Indians in the neighbourhood, according to the arrangement made with Mr Wentzel, he saw no other means of safety. The English seaman, John Hepburn, whose willing and attentive conduct on all occasions appears to be above all praise, volunteered to remain behind.

"The tent," says Captain Franklin, "being securely pitched, a few willows were collected, and the ammunition and all other articles deposited, except each man's clothing, one tent, a sufficiency of ammunition for the journey, and the officers' journals. I had only one blanket, which was carried for me, and two pairs of shoes. The offer was now made for any of the men who felt themselves too weak to proceed to remain with the officers, but none of them accepted it. Michel alone felt some inclination to do so. After we had united in thanksgiving and prayers to Almighty God, I separated from my companions, deeply afflicted that a train of melancholy circumstances should have demanded of me the severe trial of parting from friends in such a condition, who had become endeared to me by their constant kindness, and co-operation, and a participation of numerous sufferings. This trial I could not have been induced to undergo, but for the reasons they had so strongly urged the day before, to which my own judgment assented, and for the sanguine hope I felt of either finding a supply of provisions at Fort Enterprise, or meeting the Indians in the immediate vicinity of that place, according to my arrangements with Mr Wentzel and Akaitcho. Previously to our starting, Peltier and Benoit repeated their promises to return to them with provisions, if any should be found at the house, or to guide the Indians to them, if any were met."

The parting took place on the 7th October, at the distance of about twenty-four miles from Fort Enterprise; the party who proceeded with Captain Franklin consisted of eight persons besides himself, of whom two, feeling themselves unable to proceed, left him on the following day to return to Dr Richardson; the next day a third fainted; and a fourth, unable to go on, was sent back; but one of them only arrived (and arrived to add to their misery—it was Michel, the Iroquois); the other three were no more heard of. With the remaining four, Captain Franklin reached the fort on the evening of the 11th, in a state of complete exhaustion, having tasted no food for five days, excepting a single meal of tripe de roche. This was not the worst: to their utter sorrow and dismay, and as a fatal blow to every hope by which they had been animated, they found the place desolate—no provisions, no Mr Back, no Mr Wentzel, nor any letter from him to point out where the Indians were! not a trace of any living animal, and the ground covered with a greater depth of snow than it had been in the month of December the preceding year.

Recovered from the first shock of so dreadful a disappointment, a note was observed in the hand-writing of Mr Back, stating that he had reached the house on the 9th, and that he had gone on in search of the Indians. Four days after this, a messenger from him brought the exhausted party the woeful intelligence that his search had been unsuccessful. Solicitous for the fate which must inevitably await Dr Richardson and his party, unable to stir himself, from debility, and the only hunter he had with him falling sick, Captain Franklin's situation may more easily be conceived than expressed; he rallied his spirits, however, and after collecting some old shoes, scraps of leather, and skins with the hair singed off, their only food after reaching the house, he set out, with two of the Canadians, in quest of the Indians, but soon found himself utterly unable to proceed, and returned to the house of misery and desolation the following day. Hopeless, however, as in every way he appeared to be, this gallant officer never once uttered a murmur, nor gave himself up to despair. He dispatched two of the strongest to endeavour to find out the Indians, and inform them of their dreadful situation, and kept the other three, who were reduced to the last extremity, with himself.

Eighteen days were passed in this miserable condition, with no other food than the bones and skins of the deer which had been consumed the preceding winter, boiled down into a kind of soup; when, on the 29th October, Dr Richardson and John Hepburn made their appearance, but without the rest of the party.

"We were all shocked," says Captain Franklin, "on beholding the emaciated countenances of the Doctor and Hepburn, as they strongly evidenced their extreme debilitated state. The alteration in our appearance was equally distressing to them, for since the swellings had subsided, we were little more than skin and bone. The Doctor particularly remarked the sepulchral tone of our voices, which he requested us to make more cheerful if possible, unconscious that his own partook of the same key."

A history of the conclusion of this painful journey will be given in another number.

RANALD OF THE HENS.

Early in the sixteenth century, Macdonald of Clanranald married the daughter of Fraser Lord Lovat, and from this connection some very unfortunate consequences to both these powerful families followed. Soon after his marriage, Clanranald died, and left but one lawful son, who was bred and educated at Castle Donie, the seat of Lovat, under the care of his maternal grandfather. The name of the young chieftain was Ranald, and, unhappily for himself, he was distinguished by the appellation *Gaulta*, or Lowland, because Lovat's country was considered as approaching towards the manners, customs, and appearance of the Lowlands, compared to his own native land of Moidart, one of the most barren and mountainous districts in the Highlands.

Ranald was an accomplished youth, and promised to be an ornament to his family and his country; his disposition was amiable, and his appearance was much in his favour. When yet but a stripling, he visited his estate; and his people being desirous to give him the best reception in their power, he found at every house great entertainments were provided, and much expense incurred by the slaughter of cattle and other acts of extravagance, which appeared to Ranald very superfluous. He was a stranger to the customs of the country, and it would seem that he had no friendly or judicious counsellor. In an evil hour, he remarked that he was extremely averse to this ruinous practice, which he was convinced the people could ill afford; and said that, for his own part, he would be perfectly satisfied to dine on a fowl. Ranald had an illegitimate brother (or as some now say, an uncle's son), who was born and bred on the estate. He was many years older than the young Clanranald, and was possessed of very superior abilities in his way. He was active, brave, and ambitious, to which were added much address and shrewdness. Having always resided in Moidart, where he associated with the people, and had rendered himself very popular, he had acquired the appellation of *Ian Muidartich*, or John of Moidart, a much more endearing distinction than *Gaulta*.

The remark Ranald had made, as to the extravagance of his people, gave great offence; and the preference he gave to a fowl was conceived to indicate a mean sordid disposition unbecoming the representative of so great a family. John Muidartich and his friends encouraged these ideas, and Ranald was soon known by the yet more contemptuous appellation of Ranald of the Hens. He soon left Moidart, and again returned to his grandfather's house. His brother (and now his opponent) remained in that country, and he used all the means in his power to strengthen his interest. He married the daughter of Macdonald of Ardnamurchan, the head of a numerous and turbulent tribe, whose estate bordered on Moidart, and his intention to oppose Ranald became daily more evident. Several attempts were made by mutual friends to effect a compromise, but without any permanent effect. At length a conference between the brothers was appointed at Inverlochy, where Ranald attended, accompanied by old Lovat and a considerable body of his clan; but especially a very large portion of the principal gentlemen of his name were present. John also appeared; and to prevent any suspicion of violence, the number of his attendants was but small, and his demeanour was pacific and unassuming.

Lovat made proposals on the part of his grandson, and with very little hesitation they were acceded to by John and his friends. All parties appeared to be highly pleased, and they separated—John with his small party directed their course homeward, whilst Ranald accompanied his aged relation to his own country, which was much more distant.

John of Moidart, however, was all along playing a deep game: he ordered a strong body of his father-in-law's people to lie in ambush in a certain spot near the path by which Lovat and his men must necessarily pass on their return home; and he took care to join them himself, by travelling all night across the mountains.

The Frasers and young Clanranald appeared, and they were attacked by their wily foe. The combat was fearfully bloody and fatal. It is said that no more than six of Lovat's party escaped, and not triple that number of their enemies. Ranald, unquestionably the lawful representative of the family, fell covered with wounds, after having given proof that he was possessed of the greatest bravery; and his memory is to this day respected even among the descendants of those who destroyed him. John of Moidart obtained possession of the whole estate, and led a very turbulent life. Tradition says that he compromised the claims of Macdonald of Morar for a third part of the lands, which he yielded up to him on relinquishing all further right.

The conflict is distinguished by the designation of *Blar leine*, or the Battle of the Shirts, the combatants having stripped themselves during the action. It was fought at the eastern end of Lochlochy, near the line of the Caledonian Canal, in July 1554. This subject has recently become of considerable importance, being one of the principal points at issue between two chieftains of the Macdonalds. We do not pretend to interfere in any such questions; we merely relate the circumstances as they have been given to us by many persons in that country, some of them descendants of John of Moidart.*

LIFE ON THE GREAT ST BERNARD.

If I could be a summer monk, and change my vows, like my clothes, with the winter, I know no fraternity that offers stronger temptations than the Augustins of the Saint Bernard on the Alps. To escape the bustle of the world, yet be in the world; to have moving before our eyes an easy succession of society—a constant living phantasmagoria, often highly piquant, and always amusing; to indulge in literature, without the toils of authorship, the teasing of dilettanti, or the agonies of exulting criticism; to ramble over a sun-clad kingdom of mountains, with the kingship undisputed, among all the royal and heroic strugglers for a grave ten thousand feet below; to "sit on rocks, and muse o'er flood and fell;" to turn painter, poet, pilgrim, and dreamer, at one's own discretion, and without having the fear of living man before our eyes; and to do all this with the saving and singular consciousness, that we are doing some good in our vocation, that humanity is the better for us, and that our place would be missed among mankind. Utopia might grow pale to the beatitudes of the little republic under the protection of St Augustin.

But summer is, unfortunately, a rare guest, and its visit one of the shortest possible duration. The sunshine that subdues the plain, with the fidelity of a wife, is, at the famous Hospice, capricious as a first love. I had entered its walls on a day made in the prodigality of the finest season of the year. The snowy scalps of the hills were interspersed with stripes of verdure, that had seen the light for the first time within memory; the bee, that, more than all creation beside, gives assurance of summer to my ear, was roaming and humming away among the thistle-down and mosses, that even the Alpine frost is not always able to kill. I could imagine, in the air that passed in slight gusts from time to time, the odours of the Italian flowers. I lingered long at the gate of the convent, enjoying the magnificent serenity of the sky, the air, and the hills, and felt no trivial reluctance at abandoning so alluring a contemplation for a corridor crowded with servants, and a chamber imbedded in a wall as thick as if it had to stand a siege. Even the indulgence of the convent table could not wean me from the conviction that I could have got through my travel pleasantly enough, though the Hospice had, like the Santa Casa, been transported to some new Loretto.

But I had not been two hours under its roof before a burst of wind, that reminded me of nothing but the roar of Niagara, shot down the side of Mont Velan, stripped away the gathered snow of half a century in an immense sheet, and hurled it full upon the convent. All was in instant commotion within. The table was deserted by the chief part of the brotherhood, who hurried to see that the casements and doors were made secure. The ground-floor of the building, which is occupied with stables, and storehouses for wood, and the other supplies of the convent, was a scene of immediate confusion, from the crowding in of the menials and peasantry. I ventured one glance from my window—summer was gone at once; and "the winter wild" was come in its stead. The sun was blotted out of the heavens; snow, in every shape that it could be flung into by the most furious wind, whirlpool-drift, and hail, flashed and swept along. Before evening, it was fourteen feet high in front of the Hospice. We could keep our fingers from being icicles only by thrusting them almost into the blazing wood fires; the bursts of wind shook the walls like cannon-shot; and I made a solemn recantation of all my raptures on the life of an Augustin of St Bernard.

As the night fell, the storm lulled at intervals, and I listened with anxiety to the cries and noises that announced the danger of travellors surprised in the storm. The fineness of the season had tempted many to cross the mountain without much precaution against the change; and the sounds of horns, bells, and the barking of the dogs, as the strangers arrived, kept me long awake. By morning the convent was full; the world was turned to universal snow; the monks came down girded for their winter excursions; the domestics were busy equipping the dogs; fires blazed; cauldrons smoked; every stranger was pelissed and furred up to the chin; and the whole scene might have passed for a Lapland carnival. But the Hospice is provided for such casualties; and, after a little unavoidable tumult, all its new inhabitants were attended to with much more than the civility of a continental inn, and with infinitely less than its discomfort. The gentlemen adjourned to the reading-room, where they found books and papers which probably seldom passed the Italian frontier. The ladies turned over the portfolios or prints, many of which are the donations of strangers who had been indebted to the hospitality of the place; or amused themselves at the piano-forte in the drawing-room—for music is there above the flight of the lark; or pored over the shelves to plunge their souls in some "flattering tale" of hope and love, orange groves, and chevaliers plumed, capped, and guitarred into irresistible captivation. The scientific manipulated the ingenious collection of the mountain minerals made by the brotherhood. Half a dozen herbals from the adjoining regions lay open for the botanist; a finely bound and decorated album, that owed obligations to every art but the art of poetry, lay open for the pleasantries, the memorials, and the wonderings of every body; and for those who loved sleep best, there were eighty beds.—*Tales of the Great St Bernard.*

JOSEPH BLACKET.

Among the numerous instances of genius triumphing over the disadvantages of birth and education, must be mentioned the name of Joseph Blacket, who was born in 1786, at Tunstall, a small village near Richmond in Yorkshire, at which place his father was a day labourer. At eleven years of age, young Blacket was sent up to London, and placed with his brother, who was a ladies' shoemaker. Thus, by a singular coincidence, he was destined to resemble Bloomfield in his introduction to the metropolis, and, like him, to bequeath to the fraternity of shoemakers another name to the instances of poetical talent which are recorded of the "gentle craft." When about twelve years old, he was taken by a juvenile companion to see Kemble perform Richard the Third, at Drury Lane Theatre. Previously to this, he had neither read nor seen a play, but henceforth Shakspeare became his idol; "he robbed," to use his own words, "the pillow of its due, and, in the summer season, would read till the sun had far retired, then wait with anxious expectation for his earliest gleam, to discover to my enraptured fancy the sublime beauties of that great master." In short, he became irrecoverably a poet, and aspired to shine as a dramatic writer; "his eagerness on this occasion (mental depression, and personal privation)" says his editor and biographer, "was pushed to such extremity, that something of the dramatic kind pervades the whole mass of his papers. I have traced it on bills, receipts, on the backs of letters, shoe patterns, slips of paper hangings, grocery wrappers, magazine covers, battalion orders for the volunteer corps of St Pancras, in which he served, and on various other scraps, on which his ink could scarcely be made to retain the impression of his thoughts: yet most of them crowded on both sides, and much interlined." In 1810, a small volume, entitled, "Specimens of Mr Blacket's Poetical Talents," was printed and circulated amongst persons likely to patronize its interesting author. Amongst those who interested themselves most warmly in his behalf were the Duchess of Leeds, Lady Milbank, the Rev. F. Wrangham, and Mr Pratt, a name well known in literature. This gentleman zealously befriended him through life, and after his death published his "Remains" in two vols. 8vo., for the benefit of his orphan child. The list of respectable names attached to the work is honourable to all parties.

Mr Blacket died at Seaham, of a decline, August 23, 1810, at the early age of twenty-four. His grave in the churchyard is marked by a plain monument, with the following inscription from one of his own poems:—

> "Shut from the light, 'mid awful gloom,
> Let clay-cold honour rest in state;
> And, from the decorated tomb,
> Receive the tributes of the great.
> Let ME, when bade with life to part,
> And in my narrow mansion sleep,
> Receive a tribute from the heart,
> Nor bribe one sordid eye to weep."

This memorial was erected principally under the direction of his friend and patroness, Miss Milbank, the lady who became the wife of Lord Byron.—*Crispin Anecdotes.*

MOXON'S SONNETS.

We have felt considerable pleasure in glancing over a small volume of poetry, entitled, "*Sonnets, by* Edward Moxon," published, or perhaps rather printed for private distribution, in London. These sonnets have more of the correct soothing spirit of poesy in them than any thing we have met with for a long while. The following are a specimen:—

HUMAN LIFE.

Ah, what is life! a dream within a dream!
A pilgrimage from peril rarely free;
A bark that sails upon a changing Sea,
Now sunshine and now storm; a mountain stream,
Heard, but scarce seen ere to the dark deep gone;
A wild star blazing with unsteady beam,
Yet for a season fair to look upon.
Life is an infant on Affection's knee,
A youth now full of hope and transient glee,
In manhood's peerless noon now bright, anon
A time-worn ruin silver'd o'er with years.
Life is a race where slippery steeps arise,
Where discontent and sorrow are the prize,
And when the goal is won, the grave appears.

WOMAN'S HEART.

If I were asked what most my soul doth prize
Of all the good gifts men enjoy below,
Whether from Fortune or from Fame they flow,
My answer would be thus. Not wealth, which flies
Away from those who hold it in esteem,
Nor yet the honours proud place hath to give:
These with their donor changing die or live.
Not ev'n earth's fairest mountain, vale, or stream,
For these at times are 'neath dark winter's gloom.
Take the world's pleasure and its loud acclaim,
Leave me but this, like an unsullied name
Which wears for aye the self-same hue and bloom—
Need I the secret of my soul impart?
Be witness ye that love, 'tis *woman's heart.*

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 68. SATURDAY, MAY 18, 1833. PRICE THREE HALFPENCE.

THE LIVING AND THE DEAD.

IN London and other large commercial cities, I have always found myself remarkably impressed by one peculiar circumstance—the contrast between the bustling streets, full of living faces and *to-day* objects of all kinds, and the quiet and ancient churchyards which are generally found situated in the midst of them. But five yards, perhaps, off a thoroughfare which for centuries has borne the press of breathing men—where the luxuries and conveniences of life are presented in infinite variety, to attract and fix the attention of the passenger, and where men and women seem so much engaged in the affairs of this world as hardly to be conscious that there is any other—you find the silent and cloistered precinct of the old parish church, paved with the memorials of past generations, who once passed as gaily and thoughtlessly along the ways of the city as those you have just seen, but have long retreated to this narrow place, so near, yet so different from, all their former haunts. The transition, in your own case as a visitor, as well as in theirs who pass in this space from life unto death, is the most sudden and rapid that can be imagined—yet how different all the attributes of the two scenes! In the first, how neat, how fresh, how perfectly *of this world*, every thing looks!—in the other, how dismal, and, in general, how neglected! *Here* you have, at one moment, perhaps the most animated and cheering scene in the world; *there*, at the next instant, your gaze is turned upon the most torpid and gloomy. At one twinkle of the eye, you find life and all its affairs exchanged for death and all its circumstances, and pass, at a single step, from the lightest to the gravest of reflections.

I am not aware of any place where this contrast is presented in a more striking manner than it is from an eminence which rises above the north-east suburbs of the great mercantile city of Glasgow. After fluttering for hours through the crowded streets, amidst numberless beings to whom death seems the remotest of all ideas, you are led perhaps to this ornamented hill, whence you command a view of the far-spread town, with its spires peering out here and there, to mark the extent of a waste of houses which would otherwise be hardly distinguishable, while close beneath your feet you see the dark and huge cathedral, surrounded by its extensive and extending cemetery—a city of the living and a city of the dead being thus brought into immediate comparison, and weaving out of their separate influences the most impressive of all lessons.* The place of the living is, as you can see and hear, one of the busiest scenes of men's labours. It contains hundreds of thousands of industrious human beings—all toiling on from morn to eve in their various pursuits, some for mere subsistence, others for loftier objects, but all animated by human motives, and, in general, thinking of nothing in the meantime beyond the bounded horizon of mortal life. How many hearts are there bending anxiously over accompts, in which their own welfare, and that of all who are dear to them, is concerned! What numberless modes are there assumed, of gaining that surplus of value called profit, on which so much of the comfort of individuals depends! How keenly are even pence, in many cases, there aimed at and longed for—what emotions of the soul, what lightnings of the eye, what contentions between man and man, there arise from considerations of money, and of the almost infinite benefits which money can purchase! The whole vast space is covered to its uttermost nook with human creatures, whom the common doom has compelled, for the sake of bread and other sublunary enjoyments, to narrow their souls to the affairs of lucre, while they every moment tend onward to a fate more glorious or more terrific than imagination can picture, and are even now capable of thoughts and sentiments far above this world. And all this, too, is only a detachment of that trifling section of the human race, called the present generation. On or near the same ground have men toiled and moiled as anxiously as these for many centuries; and what *is* it all, and what *will* it all come to?—To the little fold which we see directly beneath—a space not large enough to contain the lodgings of a hundred living families, but which has received into its bosom thousands after thousands of the more easily accommodated dead, and will in time absorb multitudes as great, and yet never cry enough.

Yes, as the poet sings—"the paths of glory lead but to the grave." That small spot, of which so few are now thinking as they pace the streets of the busy city, is the real termination of all the journies they are making. Go they east or west, north or south, be business or be pleasure their immediate object, to this dismal scene must they arrive at last. Not a step do they take which does not bring them nearer to this ultimate point, although it may seem for the time to lead them in a different direction. Every effort which they are making to exalt themselves in this world, only renders them the richer spoil for the daily hecatomb here offered up to death, and in which, sooner or later, they must bear a part. Every improvement which they can make in their circumstances, while they live, gives them but the chance of a more secluded spot in this gathering-place of the departed, or a monument which will longer continue to tell its unmeaning and unregarded tale. In a few short years, they and all their joys and sorrows, their greatness or their lowliness, will have shrunk into this cold and uncomely scene, while their various walks of business and labour are occupied by others, to whose pursuits a similar bourne will in time be assigned.

It is not perhaps to be desired that reflections of this solemn kind should often or permanently fall upon the minds of men; for, if we were to be perpetually brooding over the gloomy view which the end of life presents, we would embitter that life to a degree rendering us quite unfit for the proper management of either our temporal or spiritual concerns. In general, however, human beings, or at least that portion of them called men of the world, are in little danger of suffering from this cause. It is more frequently observed that a constant commerce with the world hardens the heart towards all *beyond* the world—if not also to much *in* the world, regarding which it is desirable that we should keep our feelings awake. It cannot but be salutary, then, for all who are in danger of falling into this insensibility, to turn their minds occasionally to the affairs of mortality, and, seeing the uselessness of all acquisitions after death, the vanity of all terrestrial glory, and the community of destiny which overhangs the various orders of the human race, open their hearts more freely to the claims of their fellow-creatures around them, and otherwise lay up those stores which will stand in good stead when they and the world have alike passed away.

* The eminence whence this view is obtained is crowned by a monument to John Knox, the Scottish reformer, and is now in the process of being converted into a cemetery *orné*, like Pere la Chaise, at Paris, for which purpose it seems admirably fitted. In former times, it was covered with dark Scotch firs, which threw a shade of additional gloom over the cathedral burial-ground beneath, but are now succeeded by the shrubs customarily employed in landscape gardening.

EXCURSIONS OF THE LONDONERS.

THE Londoners are fond of country excursions. They delight in a holiday, which they devote to expeditions in omnibuses, chays, cabs, and all other kinds of vehicular conveyances; and if inclined to be a little stylish or so, and possessing more half-crowns than they well know what to do with, they indulge in the luxury and parade of that *ne plus ultra* of gentility—a glass coach. Many, however—perhaps the greater number—prefer jaunting by water, for which the Thames offers considerable facilities. A sail down the river to Margate, or up to Richmond, forms an excursion to be sighed after by old and young of nearly all classes of citizens. The more favoured place of resort is undoubtedly Richmond, for which two or three steam-boats depart from London every morning during the summer months, each with its band of music and deck covered with gaily-dressed persons, whose countenances proclaim a determination to be happy. There is great pleasure in witnessing the *ease-her*, the *stop-her*, and occasionally the *back-her*, on the smooth surface of the Thames, to take on board those who come in wherries to join their friends who had started with the steam-boat. The smiling faces and the salutations continue to spread a pleasure that produces one sentiment of hilarity.

There are many Londoners who prefer making this trip in boats of from two to eight oars, each capable of carrying from six to twenty persons; many boats are decorated with awnings, and colours flying at their sterns. When this mode is adopted, a pic-nic dinner is provided, by arrangements previously made; the desert, wine, and spirits, are not forgotten. Sometimes the gentlemen of the party undertake the management of the boat, although men, careful and obliging, may be hired for the purpose. The prospects, on a sunny morning, are exceedingly beautiful, and seem as if nature had put on her holiday dress to welcome her admirers. If the boat proceed from between Waterloo and Westminster Bridges, on looking eastward, a fine view of St Paul's appears above the bridge, which Canova, the Italian sculptor, denominated the finest in Europe; beneath its arches may be seen Blackfriars' Bridge, the Temple Gardens, Somerset House, with numerous spires and steeples attached to places of worship in the city of London. Looking westward, the curve of Westminster Bridge is pleasing, as varying from the horizontal line of Waterloo Bridge. The Thames is here 1223 feet wide, and, particularly at high water, presents an appearance of striking grandeur. Proceeding up the river, various associations fill the mind. Countless beings crowd every opening, while along either shore are to be seen busy multitudes, like bees on thyme banks. Houses piled like Pelion upon Ossa, and the public buildings, furnish proofs of the greatness of the capital of England. On the right, the towers of Westminster Abbey; the Hall of Rufus, now the courts of law; the Houses of Lords and Commons, are most prominent. On the left, after passing Westminster Bridge, Lambeth Palace, with the parish church, appear in their ancient grandeur. Looking again on the right, the Penitentiary seems with solemn frown to awe the evil-doers. Immediately in front is Vauxhall Bridge, near which, on the left, are the celebrated gardens, to which every visitor to London resorts in its season to be "pleased with its rattle and tickled with its straw."

Onwards, on either side, are wind and water-mills, gas-works, distilleries, tall chimneys, and other evidences of manufacture not permitted within the precincts of the cities. The bustle, the hum, and smoke, are now behind, and objects may be considered more

in detail. On the left may be seen "the Red House," a place of resort as a tea-garden, and much frequented by pigeon-shooters, where there is an enclosed space for the sport. This spot is remarkable as the ford at which Cæsar crossed the Thames in pursuit of the Britons. On the right stands Chelsea Hospital, an asylum for sick and superannuated soldiers. Near it is the Botanical Garden, in which grow two large cedars of Lebanon. Here is the terrific Chelsea-reach, the Scylla and Charybdis of the Cockney navigators. It is a wide and exposed part of the river, and, therefore, the roughest when the wind is opposed to the tide; but the inexperienced only are cast away, and it rarely happens that the consequences are more than a ducking, and a conveyance home by land.

Immediately in front is Battersea Bridge. On the right is Chelsea Old Church, containing the remembrances of Sir Thomas More and Sir Hans Sloane. On the left is Battersea Church, containing Roubiliac's monument in honour of Lord Bolingbroke. The shores now become less occupied with marks of commercial enterprise, and an occasional glance into the country may be obtained, where the high state of cultivation, and residences surrounded by their flower gardens, are remarkable. On the left, Wandsworth Church appears, and far round many villas of importance. On the right, the ground is low, but the pasturage is excellent, as proved by the fine cattle which gaze from the banks at the passengers on the river. On passing this reach, a beautiful scene opens on the eye. Putney Bridge appears in the front, its church on the left, and Fulham Church on the right. The shores on either side are enriched by lawns, dotted with shrubs and magnificent trees surrounding many elegant villas, producing an effect that excites the admiration of all beholders. Here it is usual to see the majestic swan, as if to add beauty to the scene: these birds, in pairs, take possession of portions of the Thames; they are familiar, from never being disturbed by the thousands that invade their element; they are protected by law, and encouraged by the Lord Mayor of London as an ornament to the river, and rewards are paid to such as yield security to them during the period of incubation. Putney is remarkable as the birthplace of Gibbon the historian, and Fulham for the residence of, or belonging to, the Bishops of London from the time of the Conquest. Here the infamous Bonnor practised his fanatical cruelties; and here Portius expired, who, by his amiability, might seem to obliterate from the thought his predecessor's iniquities.

At Putney, the towing-path on the bank commences, to assist the deeply-laden west-country barges, some of which are a hundred tons burthen, which, by their numbers and variety, contribute much to the picturesque scenery of the Thames. This towing-path, essential in a commercial view, is offensive to the lover of the beautiful. It prevents the lawn, or flower garden, from approaching the water's edge, and presents a line of road, with rushes and neglected trees, similar to what may be seen on the banks of a canal in Holland; yet, as a variety, perhaps it may be endured; for, on the right, the prospects are most delightful, and fraught with a thousand charms. Here is the tasteful structure of rustic elegance erected by the Margravine of Anspach, and several villas with diversified grounds, plantations and shrubberies, their blooms clustering on the water's edge. In this reach, the suspension bridge, connecting Hammersmith with Barns, appears an object of great interest; it is also a costly work of art, completed within the given estimate. The village of Hammersmith skirts the Thames for a considerable distance; the houses generally face the river, and being enriched by shrubs and trees of various kinds, display the union of taste and comfort. The terrace is worthy of notice as having been the residence of Loutherbourg the artist, and Murphy the author. A little farther on the right, is the justly admired printing establishment of Whittingham. Chiswick Church next presents a very picturesque effect, from its being surrounded by clusters of antiquated brick dwellings and trees; but it is most remarkable as the burial-place of Hogarth, the moralist with his pencil. The stately grounds of Devonshire House next become prominent, by the lofty and variegated foliage which decorates its tasteful gardens. In this mansion, Charles James Fox and George Canning, the statesmen, breathed their last. After passing Chiswick, the shores on both sides seem shorn of every attraction—low marshy grounds on the right, and the dull towing-path on the left, may be considered as a repose, so pleasing in a work of art, where all should not be brilliant; perhaps, on some minds, a corresponding effect may be produced by this undecorated scene on the Thames. This dullness exists, in a great measure, from the flatness of the adjoining parts of Middlesex and Surrey, so that not a peep into the distance can be obtained: the terrace at Barns gives a little relief to the monotony. The Thames winds considerably between just below Chiswick and Kew, forming the letter S. In the vicinity of Barns, the bullrush and flag prevail on the right, and the towing-path on the left; and nothing worthy of notice is presented, save the exertions of the rowers to pass each other; and frequently it may be observed, that skill and trifling labour will surpass the utmost toil of powerful persons who are deficient in the just management of their oars.

After having passed Barns, the left side begins to display the appearance of comfort and wealth, in villas, cottages, malt-houses, and other buildings for business, having the towing-path in front of them. On reaching Mortlake, the scenery improves, and many touches of picturesque character are visible. In this village there remains a house, once inhabited by Oliver Cromwell. On passing the turn of the river, near Strand-on-the-green, Kew Bridge appears, and interesting objects again crowd the banks. Here the splendid barges are laid up when not required by the Lord Mayor and Court of Aldermen of London for their excursions up the Thames. In Kew Church, Gainsborough the painter lies buried. Beyond the village are the Botanical Gardens, containing the finest collection of plants in the kingdom. A little farther on is Old Kew Palace, where Thomson the poet once had permission to reside. On the right, the town of Brentford spreads a long line of intermingled dwellings, trees, wharfs, timber-yards, and the *etcetera* of mercantile pursuits. On the opposite, or Surrey side, are the extensive gardens of Kew, with their richly variegated plantations and its lofty pagoda, an ornamental building of many stories, in the Chinese taste. On the right is Sion House, the seat of the Duke of Northumberland. In these grounds are the first mulberry trees that were planted in England, and a conservatory, erected at the cost of L.40,000, said to be the most splendid in the world. The gardens and park belonging to Sion House are very extensive, and finely diversified with trees of great luxuriance and stately growth, stretching along the banks of the Thames to Isleworth. This is a straggling village, the greater part of which is seen over a long island covered with osiers, reeds, and rushes; after passing which, the right bank appears decorated with villas and mansions of a superior order, being the residences of noblemen and gentlemen of fortune. About this point it is that the beautiful scenery of Richmond first strikes the eye. The level country through which the Thames has wound for miles, renders this burst of landscape splendour particularly striking. The bridge is an elegant structure of five stone arches, with a balustrade at top. From a point near the centre of the river, this view is most delightful. A small portion of the bridge is partly obscured by some trees that grow on an island on the right. On the left, some magnificent trees form a powerful mass, and are placed as if purposely to enrich the view of the town or village of Richmond, which is seen partially and in perspective, the residences rising in parterres one above the other, intermingled with trees, to the summit of the hill, on which appear ornamental portions of villas, and rich foliage of trees in various colours and characters, till they mix with the oaks that decorate the park. From this height the eye roves with delight over numerous villas, situated on the declivity down to the river's edge, as seen beneath the arches of the bridge, thence to the gay and bustling throngs before it, more particularly if it be that period when the tide has brought to the spot the variously decorated boats and barges. The white clouds glistening in the air, the dimpled water sparkling in the glorious sun, the well-dressed females, the music, the white awnings and coloured flags, altogether unite in presenting to the eye a scene of indescribable beauty. Here those who come provided make fast their boats to the bank, spread their table-cloths beneath their awnings, or on the grassy lawn, and take their welcome meal; to some these are moments of enthusiasm. The repast is most delicious, the wine possesses more than usual flavour, smiles sit on every face, while joy seizes on every heart—all is rapture. His heart must be made of impenetrable stuff, indeed, that does not feel it expand with gratitude while enjoying such a scene as this.

Richmond is about eighteen miles, by water, from London Bridge. The tide runs, on an average, about five hours up and seven down, at the rate of nearly three and a half miles per hour. It is therefore necessary some exertion should be made by the rowers, even if they start at the flow, to enable them to arrive with the tide at this delightful spot.

From their repast in their boats, some of the company repair to the hill, to view the distant scenery, take their tea, and return to London with the tide.

Others, on their arrival at Richmond Bridge, go immediately to the hill, where there is a splendid tavern—the Star and Garter—at which every attention is paid, and all that can be desired may be obtained at charges moderate as at ordinary taverns. Such parties enjoy the prospect from the gardens, the windows, or the terrace, which is kept in excellent state during the season. After their refreshment, the return to London may be regulated by stage-coach, or conveyances with which Richmond is well provided. The view from Richmond Hill has been noticed by many writers as enchanting. Foreigners are enthusiastic in their admiration. The Londoners, with some exceptions, consider it to possess surpassing beauty. If the scene be examined, by comparison with others of similar character, perhaps it may be preferred; but it has no portion of the picturesque, nor of the grand, to render it imposing: all is simple and chaste—in the language of artists, such as Claude would have felt pleasure in delineating. Considered attentively, the view from Richmond Hill must depend on some associations in the mind of the spectator, which assist in communicating the pleasure which seems to be felt so universally. Scenery viewed from an eminence is deprived of all the charm which powerful contrast of foreground might contribute, and we inspect but the middle plan and distance of the picture. Thus it is in this scene.

The grounds, however cultivated, the villas, however elegant, situated on the declivity, far as the meadows of Petersham, are as nothing to the prospect. If the eye be directed to the winding of the Thames, and the park-like scenery of the grounds beyond, the effect is at once delightful; the spectator feels it would be gratifying to indulge in a walk on such a spacious lawn—to repose and read beneath those luxuriant trees—to return and gaze on the transparent water, with its beautifully reflected objects—and readily acknowledge in this the features of lovely nature. If the eye be directed beyond the second plan of this picture, surprise is excited by the range over range of masses of foliage, marked by their atmospheric degrees of remoteness into thin air. A few gently rising grounds appear; even the flag on the tower of Windsor Castle may be distinguished, a distance of sixteen or eighteen miles; but not a hill to diversify the repetition of parallel lines, formed by the masses of trees before-mentioned, which stretch across the whole horizon of the prospect. Nature has been bountiful in scattering her enchantments over this scene, and art has been active in contributing her graces; for wherever the eye may be directed, some portion of mansion or elegant villa peeps from amid its leafy veil, or pours a whitienng curl, in contrast to some umbrageous screen, and gives an animation to the whole. This widely-spread proof of wealth and enjoyment, in no small degree, contributes to the rapture which all experience who contemplate this prospect. Richmond has for ages been considered a spot of peculiar beauty. It was formerly called Sheen, in the Saxon language signifying resplendant. Here stood a palace, in which Edward the First and Second resided. Edward the Third died here of grief for his heroic son. Here also died Anne, Queen of Richard the Second. The palace was repaired by Henry the Fifth. It was burnt in 1497—rebuilt by Henry the Seventh, who gave it the name of Richmond, and died here. Queen Elizabeth was some time a prisoner here, during the reign of her sister Mary, after whose death, Elizabeth made it her favourite place of residence, and here she closed her illustrious career.

But we must hasten to return to the metropolis. The sun is sinking in the west, and casting his long shadows across the lawns and villa grounds. The boat again receives our party, and, dropping down the river, we, with little effort, reach the landing place near one of the upper bridges, just as twilight departs, and leaves the heavy masses of houses around us in the gloom of night.

POPULAR INFORMATION ON SCIENCE.

DEW.

After the death-like repose in which all nature has been hushed by the bleak storms of winter, the return of spring may truly be hailed as a season of delight, inspiring, as it does, even the humblest being in the scale of organization with a new impetus of life, and clothing even inanimate objects with a beauty, which speaks not only to the eye, but audibly to the heart of man. It is a transition from all the torpor of utter inactivity to the joyous consciousness of rekindled existence, and is the very season which invites us the most urgently to contemplate and study the infinite variety of objects and phenomena which diversify, while they adorn, the path of our earthly pilgrimage. Such cannot be considered as a heavy or an irksome task, but as a recreation, more calculated than any other to wean away our thoughts from those cares and anxieties which the common business of life winds painfully around the heart; besides which, it enables us to appreciate more deeply and fervently the perfection which is every where observable throughout the universe.

We have already explained the causes of the formation, and the phenomena attending the fall, of hail, rain, snow, &c.; and now a gentler agency claims our consideration, for the purpose of entering on which we may suppose ourselves retired into an open country, where we can attentively observe the silent operations of nature. No sooner does the sun begin to decline towards the horizon, than its rays, while they reflect a glowing crimson light on tower and spire, and on the clouds afar off, fall more slantingly to the earth, whereby their intensity is diminished, and a change of temperature immediately induced; for the air soon feels chilly and damp, and the grass beneath our footsteps becomes moistened with a genial and refreshing dew. Let us not pass this over hastily, but rather pause to examine how it happens. It is no occult mystery, but may easily be explained; for it is by simple means that nature generally accomplishes her most beneficent designs. It has been elsewhere explained, that all bodies receive a certain quantity of heat, which, under particular circumstances, they again emit from them; in doing which, they necessarily be-

come colder than they previously were, unless they receive in exchange another quantity of heat sufficient to compensate for the loss they have sustained. In this case, their temperature will remain stationary; but if they part with more than returns to them, their temperature necessarily must fall. When, then, the object so cooled is encompassed by a warm and moist medium, it condenses, by its cold contact, vapour on its surface, and thereby becomes moistened. Hence the origin of dew; for no sooner does the sun sink towards the horizon, than the blades of grass which clothe the surface of the earth give out the heat which they have been receiving during the day; the consequence of which is, that their temperature falls so much below that of the surrounding air, that they condense on their surfaces part of the moisture which immediately surrounds them. The temperature of the body, as indicated by the thermometer, at which this deposition takes place, is called the "dew point," which, for the formation of dew, must always be below the temperature of the surrounding atmosphere: indeed, the quantity of dew formed will always be in proportion to the coldness of the grass, and to the quantity of moisture suspended in the air. Besides this, after the sun has set, the moisture which the earth has imbibed during the day, and which still rests below the grassy surface, rises up or evaporates, in doing which, it rises up through or between the blades of grass, the cold contact of which gradually condenses it. Dew, therefore, on calm and clear nights, is more abundant shortly after rain than during a long season of dry weather. During westerly or southerly winds, which are generally impregnated with moisture, it is also formed more copiously than during easterly and northerly winds. Besides the quantity of moisture existing in the air, the greater or lesser copiousness of the dew formed, depends, as we have premised, on the coldness of the objects on which it is about to be condensed. If the night be calm and clear, the grassy blades emit their heat freely, and it is dispersed through the atmosphere, without any equivalent return, whereby the temperature of the grass soon sinks sufficiently low to condense the surrounding vapour; but if, instead of this, the night be cloudy, then the clouds reflect, like mirrors, the rays of heat back again to the grassy blades, and prevent this diminution, so that less dew is then deposited. If, in addition to the sky being overcast with clouds, the weather be windy, no dew will be formed; for the temperature of the grass is then prevented sinking by the agitation of the air, by which a warmer current is continually brought to succeed the colder current by which it is surrounded. Hence, if, during the night, the weather, from having been calm and serene, become windy and cloudy, not only will dew cease to form, but that which has been already deposited will disappear, or diminish considerably. Every kind of covering or shelter which extends above any object, will interrupt the radiation or escape of its heat; for which reason gardeners, to prevent plants being chilled, cover them over, on the approach of evening, with a layer of straw or matting. Ice is formed in Bengal during the clearest and calmest nights, by placing water in shallow vessels a little below the earth's surface, in which situation it has been observed that bodies grow colder from radiation to the heavens at night than in any other; but this process becomes checked if the night turn cloudy and windy. The covering of snow which the earth enjoys during winter, protects in like manner its warmth, by preventing the radiation of its heat. For this reason, the grass which is situated beneath the boughs of large and spreading trees, becomes only sparingly moistened with dew; for the shelter above interrupts the progress of radiation from the substances underneath, and so preserves their temperature. Accordingly, it is an established axiom, that whatever diminishes the view of the sky, as seen from the exposed body, will occasion the quantity of dew to be less than would have been deposited if the exposure to the sky had been complete. Dew is formed, therefore, more sparingly and irregularly in cities than in the country, where the most open grassy plains are always the most abundantly bedewed. In this country it begins to appear in shady places as soon as the heat of the atmosphere has declined; but though the grass on clear still evenings often becomes moist several hours before sunset, dew is seldom present in such quantities as to exhibit visible drops until the sun reaches the horizon; nor does it become copious until some time after sunset. It continues to form also in shaded places some time after sunrise; and it is remarkable, that more dew forms a little before, and in shaded places a little after sunrise, than at any other period. It has also been observed, that more dew is formed between midnight and sunrise, than between sunset and midnight—a circumstance which is owing to the cold of the atmosphere being greater in the latter than in the former part of the night. As the quantity of dew deposited thus depends so much on the degree of coldness which the body about to be bedewed attains, its quantity must be materially modified by the greater or the lesser facility with which substances part with their heat. Grass, being a filamentous substance, parts more readily with its heat than garden mould or gravel; wherefore dew is more plentifully deposited on meadow grounds than on ploughed lands. Thus, cultivated soils are refreshed with abundance of dew, while barren rocks and sandy deserts do not receive this congenial moisture. Indeed, every shrub and herb, every leaf and blade of grass, possesses, according to its kind, a different power of radiation, so that each condenses as much dew as is necessary for its own individual and peculiar exigencies. Thus, not even a single dew-drop seems to have been formed by the rude hand of chance, but is adjusted by the balance of infinite wisdom to accomplish a definite and benevolent end.

The water of dew, when collected, has been superstitiously considered to possess various remarkable, and almost supernatural qualities. Borelli asserts that, in some instances, dew-water is capable of dissolving gold. In the West Indies, and in other tropical climates, numerous diseases are attributed to its noxious qualities. But such notions are, for the most part, as fanciful as the popular virtues of May-dew, which, in this country, has been considered an excellent cosmetic capable of clearing and beautifying the complexion. It may, however, be observed, that some plants give out so much carbonic acid as to impregnate very agreeably the dew-water formed on them; and this, in the peninsula of India, is collected as a luxury, and used medicinally. By the Moor men, and rich Hindoos, it is much prized, and is obtained by spreading pieces of muslin cloth in the flowering sennaga, from which, when well saturated, the moisture is wrung out, and preserved for use. It is an old observation, that the presence of dew assists the putrefaction of animal substances; thus Pliny, in his Natural History, remarks—"Whensoever you see, at any feast, the dishes and platters whereon your meat is served up to the board sweat or stand of a dew, terrible tempests may be prognosticated"—an ominous prediction, founded on this popular observation. It has also been remarked, nor need the reference excite the smile of credulity, that animal substances, exposed in the open air to the light of the moon, very quickly undergo putrefaction. Thus Plutarch observes, "the moon has some influence on flesh; meat corrupts sooner in the moonlight than in the sun." "Fish," says Montgomery, "hung up all night in the light of the moon, will occasion violent sickness and excruciating pains." So, too, Mr Madden, in his Travels in Turkey, informs us "that the Arabs attribute a morbific influence to the moon, and think it causes ophthalmia and catarrh." The solution of all which mysterious speculation is simply this:—that the presence of moisture promotes, and is indeed essential to, the decomposition of animal matter, and, on bright moonlight nights, the air being generally still, and the firmament unclouded, such substances radiate their heat very freely, and soon become covered with dew. It is neither the dew-water, therefore, nor the moonbeams, which are charged with any specific morbid influence. Thus, in the blindness of humanity, do we often mistake the very facts before us, and take erroneous data for the foundation of our most favourite theories; but the history of the world proves that truth is eternal and progressive, and, in the end, must triumph over error and superstition.

HONEY DEW.

There is a species of dew which is sweet and grateful to the taste, named honey dew, which often collects on the leaves of plants in very considerable quantities. It is now known to naturalists that it is occasioned by insects (of the genus *Aphis*) which inhabit the under side of the leaves, and shed this liquor on the surface of those below. This little creature seems to subsist by drawing the juices from the sap-vessels, and, by some peculiarity of constitution, rejects the sweet or saccharine matter which falls on the leaves below, and afterwards affords nutriment to many other insects. Ants are so fond of it, that a whole colony may be found travelling to the highest branches of a tree in search of it; and they have been seen to seize the clear drop, while yet attached to the body of the *Aphis*, which, although defenceless, was not molested farther by these predaceous wanderers. "This clammy substance," says Gilbert White, "is very grateful to bees, who gather it with great assiduity; but it is injurious to the trees on which it happens to fall, by stopping the pores of the leaves. The greatest quantity falls (or, he should have said, is collected) in still close weather, because winds disperse it, and copious dews dilute it, and prevent its ill effects."

All observers of nature must have remarked, that the deposition of dew cools, refreshes, and invigorates the vegetable creation. "Without its presence," says Mr Savary, "Egypt would be uninhabitable; for so copiously does it gather during the summer night, that the earth in the morning is so deeply soaked, that one would imagine that rain had fallen during the night. So, too, on the coast of Africa, and in some other countries, the deposition of dew is so regular and abundant as to supply the want of rain. Its beneficial effects in warm countries was doubtless the reason why Scripture promised the Israelites, who inhabited a climate pretty similar to that of Egypt, the dew of heaven, as a signal favour. So, too, the blessings that arise from unity of love are in the Psalms likened to the dews of Hermon, and to the dew that descended on the mountains of Sion. When, indeed, we pause to contemplate the peculiar circumstances under which dew is formed, and observe that it gathers silently and gently upon the leaves of the most delicate flowers, and on every individual blade of grass, when all nature is about to sink into repose, it suggests to us many pleasing associations; nor can we avert the reflection, that, even beneath the shadow of night, the spirit of a beneficent being is abroad ministering to the wants of the humblest object of creation. It was on such a calm and serene night as we have seen is necessary for the deposition of dew, that the noble poet probably penned these lines, with which we may appropriately conclude this brief sketch:—

> "There seems a floating whisper on the hill,
> But that is fancy; for the starlight dews
> All silently their tears of love distil,
> Weeping themselves away, 'till they infuse
> Deep into Nature's breast the spirit of her hues."

THE MISERIES OF SAVAGE LIFE.

SURROUNDED as we are by all the blessings of civilization, we seldom look back into the darkness and misery of those past ages, when mankind, unenlightened by knowledge, and unaided by experience, had to contend with the most appalling difficulties. Yet such a retrospect, however briefly taken, must be instructive, exhibiting, as it does, in the most vivid colours, the advantages and blessings which we have derived from the extension of those divine truths, which have alone ameliorated our moral and intellectual condition. The infancy of every nation may be wrapt in darkness; but the records of the most ancient history, and the structure of the globe itself, establish the fact, that a deluge, terrible in its nature, and destructive in its consequences, at one time swept over the tops of the highest mountains. Previous to this eventful epoch, many useful arts appear to have been acquired; but afterwards, mankind, dispersing in scattered groups through the world, sought only to satisfy their immediate physical wants, and degenerated into a state of ignorance and barbarism. Some lived in woods, others in caves; thus, want of sociability engendered ferocious and savage habits, and, amidst the moral anarchy that ensued, we can scarcely discover one redeeming ray of light. Thus the great continents of Africa and America, and the northern parts of Europe, had their forests peopled with wandering and scattered tribes of savages, scarcely able to supply themselves with the commonest necessities of life. Even the use of fire was by some forgotten—a fact still attested by many travellers. This was the case with the inhabitants of the Marian Islands, discovered in 1521. Never was astonishment greater than theirs when they saw it, on the descent of Magellan on one of the islands. At first they believed it to be a kind of animal that fixed itself to and fed upon the wood. Some of them who approached too near being burnt, the rest were terrified, and dared not look at it, even from a distance. They were afraid, they said, of being bit, or that the dreadful animal would wound them by his violent respiration. The Egyptians and Phœnicians, having forgotten the method of procuring fire, discovered it by observing that forests were set on fire by the collision of their trees. The Chinese say, that Sui-gin-chi, one of their first kings, taught them how to kindle fire, by rubbing two pieces of wood strongly against each other. Being so unacquainted with the use of fire, men could not then dress nor prepare their food in a proper manner. Hence historians speak of nations who had no other way of dressing their food, except by exposing it to the rays of the sun. But many had not recourse to this expedient, and devoured meat in a raw state—a custom at present retained by some uncivilized tribes. The fruits and herbs which grew wild in the woods and fields, constituted the principal food which mankind first sought, and which they ate without any artificial preparation. The Egyptians originally lived on the roots and herbs which grew in their fields and marshes, without any other way of distinguishing them but by taste. The Greeks in the first ages fed on roots and wild fruits, especially on acorns—whence the custom with them arose of presenting every new married pair, on the day of their nuptials, with a basket of acorns mixed with bread. Herodotus speaks of a nation in India that lived on herbage, and similar examples might be cited. But mankind did not, even in the primitive ages, confine themselves to this simple kind of diet. Incredible as it may appear, some savages have been found who eat rats, toads, serpents, and various reptiles and insects. But, more deplorable than this, is the well-attested fact, that some men have existed savage enough to make even human flesh their food. People have been known in Asia, Africa, and America, who hunted their fellow men as we do wild beasts. On these occasions, they endeavoured to take them alive; upon which they dragged them to their huts, and, after killing them, devoured them. It is even asserted by some authors, that formerly, in parts of these countries, there were public markets for human flesh. Such horrible practices as these can only, in reason, be ascribed to that savage state induced by the sufferings arising from extreme hunger, in which deplorable extremity mothers have been known to devour their own children. The Jews, so late as the days of Trajan, having overcome a considerable army, composed of Greeks and Romans, near Cyrene, ate those who fell in battle, anointed themselves with their blood, and made clothes of their skins. "The Padæi, a nation of India," says Herodotus, "live upon raw flesh. When either males or females approach towards old age, they are slain, and devoured by their nearest relations or neighbours." The custom of eating the prisoners taken in war seems to have prevailed

among many nations. "Why do I speak," says an old historian, "of other nations, when I myself saw, while I was in Gaul, the Scots, who inhabit a considerable portion of the island of Britain, eat human flesh? And when they found in the woods shepherds and keepers of hogs, they cut off the hips of the men, and the breasts of the women, which they esteemed as the most delicious repast." Captain Cook describes the prevalence of this horrible practice among the New Zealanders. "According to their system of belief," says he, "the soul of the man whose flesh is devoured by the enemy is doomed to a perpetual fire, while the soul of the man whose body has been rescued, as well as the souls of all who die a natural death, ascend to the habitations of the gods." But we need not enlarge on this savage custom, which, doubtless, must excite a shudder in every bosom. Let us attend to other points illustrative of the degeneration of mankind into the savage state.

In the infancy of the world, even in the patriarchal age, attention was paid to dress, the magnificence of which then appears to have consisted in the fineness of the stuff, and the variety of colours it exhibited. Rebecca, the better to disguise Jacob, made him put on Esau's garments, which she kept with care, and which Moses speaks of as very beautiful. So likewise Jacob, who tenderly loved Joseph, gave him a conspicuous robe, which excited the envy of his brethren. After the dispersion of mankind, however, many of them allowed their offspring to give up the use of clothes, and savages are still found, who, to this day, have no idea of covering for their bodies. The Patagonians were accustomed to go naked, and suffered no inconvenience from the bitter coldness of their climate. Even in this country, the Picts continued naked until the time of Serverus. The habits induced by the wants of uncivilized life necessarily became of the most humiliating description, for, uncontrolled by any moral law, every tribe was left to be influenced by their own selfish and corrupt passions. In such a condition, the human soul may be aptly compared to a dark lake, over whose accursed bosom no single redeeming ray of light is allowed to gleam. Even the intercourse between the sexes in such a state does not lead to humanity, but is often preluded by acts of brutal and atrocious violence. Among the savages of New South Wales, the savage selects his intended wife from men of a different tribe, generally at enmity with his own. He steals upon her in the absence of her protectors, strikes her a severe blow on the head with a club, and drags her away, stunned and bleeding, to his retreat. She is then completely subjected to his control; nor do any of her tribe think of avenging the cruelty. In this barbarous condition, even the parent has often no sympathy towards his offspring, and frequently leaves it to die exposed in the forests, or on the banks of a river—or, immediately upon birth, puts it to death. The Giagas, a fierce and wandering people in the central parts of Africa, bury all their children the moment of their birth, choosing, in their stead, those children which have been taken in war. Among the savages in New South Wales, if the mother of a child, nourished by the breast, die, the helpless infant is buried alive in the same grave with the mother. The father himself places his living child on the body of his dead wife, and, having thrown a large stone upon it, the grave is instantly filled up. The Hindoos, and many other nations, in their early history, adopted, to a considerable extent, this unnatural and barbarous practice.

In this savage state, man desires at first only to satisfy his own immediate physical wants; then, when, by design or accident, he is led to intercourse with men similar in condition to himself, he gives way to the most inexorable passions. Often the passion of cruelty, and that to a most incredible extent, becomes the predominating feature of his character; and so hardened, indeed, does his heart become, that it seems even to pant with delight in witnessing spectacles from which every feeling of humanity and compassion would shrink back in confusion and dismay. "I have been present," says Hearne, describing a tribe of North American Indians, "when one of them would imitate the groans, distorted features, and contracted positions of a man who had died in most excruciating pain; and the exhibition put the whole company, except myself, into violent fits of laughter." Amidst the moral anarchy which in such a degenerate condition prevails, some of the passions incident to human nature scarcely manifest themselves, while others rise up in frightful and appalling violence. Jealousy among savages, in the lowest state of degradation, is seldom or never cherished; for the existence of this passion implies a degree of affection which never animates, or sheds a kindly influence over, the savage bosom. But revenge, no matter whether it exhaust its fury on inanimate objects, on beasts of the forest, or upon the offending fellow man, is an ever active principle which stimulates perpetually to every species of outrage. Among the Kookies, it is customary, if one of their number be killed by falling from a tree, for the rest to assemble and cut it down, and, whatever be its size, they convert it into chips, and scatter them to the wind. If one of them become the prey of a tiger, the whole tribe is up in arms, and the family of the deceased remains in disgrace, until, by destroying the animal, they can give a feast of its flesh. Among the black Circassians, when one man has been killed by another, the relatives of the deceased consider it necessary to avenge his death by the blood of the murderer, which, they conceive, can alone give his and their souls rest.

No picture can present in colours too deep and glowing the unmitigated horrors of savage life; yet, strange to say, some of our philosophers have pretended to maintain that this is the condition natural to man—this a state of primeval unclouded happiness! Happy savage! exclaim the disciples of Rousseau; if the boughs of the forest defend him from the storm, if the herbs of the field and fruits of the woods afford him but scanty nourishment, still his wants are satisfied; he is not insulted by the haughty frowns of his superiors; he is not forced to contrast his own narrow dwelling with turretted palaces that seem to mock his indigence; he is free as the wind, and may, from sunrise to sunset, bask in indolence, or exert himself with activity, exactly as his own innate desires may happen to prompt him. But this is vain and hollow sophistry. They forget that every tempest which howls about his forest dwelling, strikes him to the heart with superstitious fear and frightful alarm: they forget the cares and anxieties which prey upon him while he seeks the precariously found herbs or fruits, which scarcely satisfy the gnawing pains of hunger: they forget that his freedom, which is his birthright, is another name for idleness run wild, and is accompanied neither by peace, safety, nor happiness. And yet, notwithstanding all this, our best philosophers continually appealed to man in the savage state to illustrate what are the natural propensities and habits of the human race. Most assuredly this is a glaring error; for the savage state is to be regarded only as that state of degradation into which the human race gradually fell after their dispersion into distant countries, and from which they can progressively be liberated by the benignant agency of civilization. Were it the condition natural to man, surely it would be somewhat perpetuated; but instead of this, the moment one ray of Christian light penetrates into the gloom of his forest, the savage abandons his reedy hut, he gives up his depraved and ferocious habits, his passions soften down, and he becomes "redeemed, regenerated, and disenthralled." It is not for us to determine what are the progressive stages to human happiness, nor wherefore a certain scale or gradation in the moral and mental condition of mankind should be observable throughout the world; yet doubtless this has been so designed in the great scheme of the creation, and therefore all approaches to perfection in religion, morality, politics, and science, must be accomplished gradually—the first step of the progression leading us out of that night of darkness and ignorance, which, like the original chaos, seems to be the primary condition both of the intellectual and moral world.

EMIGRATION.*

By the Ettrick Shepherd.

I know of nothing in the world so distressing as the last sight of a fine industrious independent peasantry taking the last look of their native country, never to behold it more. I have witnessed several of these scenes now, and I wish I may never witness another; for each of them has made tears burst every now and then into my eyes for days and nights, and all the while in that mood of mind that I could think about nothing else. I saw the children all in high spirits, playing together and amusing themselves with trifles; and I wondered if those dear innocents, in after life, would remember any thing at all of the land of their nativity. They felt no regret, for they knew that they had no home but where their parents were, no staff or stay but on them. They were beside them, and attending to all their little wants, and they were happy. How different the looks of the parents! They looked backward toward their native mountains and glades with the most rueful expression of countenance. These looks never can be cancelled from my heart; and I noted always, that the older the men were, their looks were the more regretful and desolate. They thought, without doubt, of the tombs of their parents and friends whose heads they had laid in an honoured grave, and that, after a few years of the toil and weariness collateral with old age, they were going to lay down their bones in a new world, a far distant clime, never to mix their ashes with those that were dearest to them. Alas! the days are gone that I have seen! It is long since emigration from the Highlands commenced; for, when clanship was abolished as far as government edicts could abolish it, the poor Highlanders were obliged to emigrate. But never till now did the brave and intelligent Borderers rush from their native country, all with symptoms of reckless despair. It is most deplorable. The whole of our most valuable peasantry and operative manufacturers are leaving us. All who have made a little money to freight them over the Atlantic, and procure them a settlement in America, Van Dieman's Land, or New South Wales, are hurrying from us as from a place infected with the plague. Every day the desire to emigrate increases, both in amount and intensity: in some parts of the country the movement is taking place to an immense extent. In the industrious village of Galashiels, fifty-two are already booked for transportation. In the town of Hawick, and its subordinate villages, are double that number. My own brothers, sisters, nephews, and nieces, are all going away; and if I were not the very individual that I am, I should be the first to depart. But my name is now so much identified with Scotland and Ettrick Forest, that, though I must die as I have lived, I cannot leave them.

But the little affecting story I set out with the purpose of telling is not begun yet. I went the other year to see some particular friends on board the gallant ship, Helen Douglas, for the British settlements in America. Among the rest was Adam Haliday, a small farmer, who had lost his farm, and whom I had known intimately in my young days. He had a wife, and, I think, nine sons and daughters; but his funds being short, he was obliged to leave his two oldest sons behind, until they themselves could procure the means of following him. An old pedlar, whom I think they named Simon Ainslie, was there distributing little religious tracts among the emigrants gratis, and perhaps trying to sell some of his cheap wares. The captain and he and Mr Nicholson, the owner of the vessel, myself, and some others, were standing around the father and sons, when the following interesting dialogue took place:—

"Now, Aidie, my man, ye're to behave yoursel, and no be like a woman and greet. I canna bide to see the tears comin' papplin' ower thae manly young cheeks; for though you an' Jamie wad hae been my riches, my strength, an' shield in America, in helpin' me to clear my farm, it is out o' my power to take ye wi' me just now. Therefore, be good lads, an' mind the thing that's good. Read your Bibles, tell aye the truth, an' be obedient to your masters; an' the next year, or the next again, you will be able to join your mother an' the bairns an' me, an' we'll a' work thegither to ane anither's hands."

"I dinna want to gang, father," said Adam, "until I can bring something wi' me to help you. I ken weel how ye are circumstanced, an' how ye hae been screwed at hame. But if there's siller to be made in Scotland in an honest way, Jamie an' me will join you in a year or twa wi' something that will do ye good."

By this time poor little James's heart was like to burst with crying. He was a fine boy, about fourteen. His father went to comfort him, but he made matters only the worse. "Hout, Jamie, dinna greet that gate, man, for a thing that canna be helpit," said he. "Ye ken how weel I wad hae likit to hae had ye wi' me, for the leaving ye is takin' the pith out o' my arm. But it's out o' my power to take ye just now; for, as it is, afore I win to the settlement, I'll no hae a siller sixpence. But ye're young an' healthy an' stout, an' gin ye be a good lad, wi' the blessing o' God, ye'll soon be able to join your auld father an' mother, an' help them."

"But aince friends are partit, an' the half o' the globe atween them, there's but a sma' chance that they ever meet again," said poor James, with the most disconsolate look. "I wad hae likit to hae gane wi' ye, an' helpit ye, an' wrought wi' ye, an' leev'd an' dee'd wi' ye. It's an awfu' thing to be left in a country where ane has nae hame to gang to whatever befa' him."

The old man burst into tears. He saw the prospect of helpless desolation, that preyed on his boy's heart, in the event of his being laid on a bed of sickness; but he had no resource. The boat came to the quay, in which they were about to step; but word came with her that the vessel could not sail before high tide to-morrow; so the family got one other night to spend together, at which they seemed excessively happy, though lodged in a hay-loft.

Having resolved to sail with the Helen Douglas as far as the Point of Cumberland, I attended the next day at the quay, where a great number of people were assembled to take farewell of their friends. There were four boats lying ready to take the emigrants on board. The two brothers embraced their parents and sisters, and were just parting, rather decently, when the captain, stepping out of a handsome boat, said to Haliday, "Sir, your two sons are entered as passengers with me, so you need not be in such a hurry in taking farewell of them."

"Entered as passengers!" said Haliday; "why, the poor fellows hae na left themsels a boddle in helpin' to fit out their mother and me; how can they enter themsels as passengers?"

"They are entered, however," said the captain, "and both their fare and board paid to Montreal, from which place you can easily reach your destination; but if any more is required, I am authorised to advance that likewise."

"An' wha is the generous friend that has done this?" cried Haliday, in raptures, the tears streaming from his eyes. "He has strengthened my arms, and encouraged my heart, and rendered me an independ-

* We willingly give insertion to this communication from Mr Hogg—for, though the prejudice of place should never interfere to a great extent with the prospects which an individual may have of bettering himself by emigration, it cannot be denied that there is a sentiment of a sacred, and, in one point of view, most useful kind, in one's attachment to his native country; which sentiment appears to us to be developed in a very touching manner by our respected correspondent.

ent man—at aince, tell me wha is the kind good man? —was it Mr Hogg?"

The captain shook his head. "I am debarred from telling you, Mr Haliday," said he; "let it suffice that the young men are franked to Montreal. Here are both their tickets, and there are their names registered as *paid*."

"I winna set my fit aff the coast o' Scotland, sir," said Haliday, "until I ken wha has done this generous deed. If he should never be paid mair, he can be nae the waur o' an auld man's prayers night and morning; no, I winna set a fit into the boat—I winna leave the shore o' auld Scotland till I ken wha my benefactor is. Can I gang awa without kenning wha the friend is that has rendered me the greatest service ever conferred on me sin' I was born? Na, na! I canna, captain; sae ye may just as weel tell me at aince."

"Then, since I must tell you, I must," said the captain; "it was no other than that old packman with the ragged coat."

"God bless him! God bless him!" fell, I think, from every tongue that was present. The mother of the young men was first at the old pedlar, and clapping her hands about his neck, she kissed him again and again, even maugre some resistance. Old Haliday ran and took the pedlar by both hands, and in an ecstacy, mixed with tears and convulsive laughter, said, "Now, honest man, tell me your direction, for the first money that I can either win, or beg, or borrow, shall be sent to reimburse you for this. There was never sic a benefit conferred on a poor father an' mother sin' the world stood up. An' ye sall hae your money, good auld Christian—ye sall hae your siller."

"Ay, that he sall!" exclaimed both of the young lads.

"Na, na, Aidie Haliday, say nae mair about the payment just now," said the pedlar; "d'ye ken, man, I had sundry verra strong motives for this: in the first place, I saw that you *could not* do without the lads; and mair than that, I am coming up amang my countrymen about New Dumfries an' Loch Eiry, to vend my wares for a year or twa, an' I wantit to hae ae house at ony rate where I wad be sure o' a night's quarters. I'll ca' for my siller, Aidie, an' I'm sure to get it, or value for't; an' if I dinna ca' for't, be sure never to send it. It wad be lost by the way, for there's never ony siller reaches this frae America."

I never envied any man's feelings more than I did the old pedlar's that day, when all the grateful family were hanging around him, and every eye turned on him with admiration.

LITERARY HISTORY OF THE BIBLE.

MODERN FOREIGN VERSIONS.

We have seen, by the preceding articles on this subject, that, at some period prior to the promulgation of Christianity, there existed a valuable translation of the Scriptures into Greek, entitled the SEPTUAGINT, or the SEVENTY, from the number of individuals engaged in its arrangement. It has also been shown, that, at an early period in the history of the Christian church, a Latin translation of the Scriptures was found, called the VULGATE. These Greek and Latin versions of the Bible did not supersede the use of the original Hebrew Scriptures, such being ever preserved by the Jews with the most extraordinary care, and generally made use of by them in their synagogues, while the Septuagint and Vulgate, from being in more modern languages, were in more extensive use among churchmen and the people. The existence of these early versions is therefore an incontestible evidence that the Scriptures, as now found in the original tongues, have not been impaired, interpolated, or abused, during the lapse of at least two thousand years.

Almost all the modern nations of Europe, and part of Asia, have had versions of the Scriptures, in whole or in part, taken from other versions, or from the originals. Arabic having become the vulgar language of almost all the East, there are several versions of the Bible in Arabic, which, besides the Syriac version (which is understood by the learned alone), are not only used by the Maronites and other Christians in Asia, but also by the Jews and Samaritans. About the year 900, Rabbi Saadias Gaon, an Arabian Jew, translated the Old Testament, or, at least, the Pentateuch, into Arabic. Another Jew of Mauritania translated the Pentateuch, and Erpenius printed his work. Risius, a monk of Damascus, translated the New Testament. The greater part of these versions were from the Septuagint.

The Persians have some manuscript versions of the Bible. Rabbi Jacob Favos, a Jew, translated the Pentateuch into Persian, and the Jews printed it at Constantinople in 1546. This, with the Gospels translated by one Simon, a Christian, are inserted in the London Polyglott;* but these Gospels are far from being correctly done. There have been several other Persian versions of the Psalms and the New Testament executed in modern times, particularly the New Testament by Henry Martyn, the celebrated English missionary, translated by him in the city of Shiraz in Persia, and printed at Petersburg in 1815.

The Turks have likewise some translations in manuscript of the Bible in their language. In 1666, a Turkish New Testament was printed at London, for the purpose of being dispersed in the East. It is mentioned, that, in 1721, the Grand Seignor ordered an impression of Bibles to be produced at Constantinople, that they might be confronted with the Koran, or Bible of the Mahomedans. In the Report of the British and Foreign Bible Society for 1815, it is mentioned, that a Turkish translation in manuscript of the whole Bible had been discovered in the repositories of the University of Leyden, where it had remained for a century and a half. The author of this translation was by birth a Pole, of the name of Albertus Boboosky, and born in the beginning of the seventeenth century. While a youth, he was stolen by the Tartars, and, being sold to the Turks in Constantinople, he was by them educated in the Mahomedan faith. His name was changed to Hali Bey, and when he grew up, he was constituted chief dragoman or translator to Mahomed the Fourth. The learning of Hali Bey was considerable. He understood seventeen languages, and he is said to have spoken in French, German, and English, like a native. He was particularly fond of the English language, and, at the request of the Hon. R. Boyle, translated the Church of England Catechism into Turkish. He also composed different works himself, several of which have been published. His chief work, however, is his translation of the whole Bible into the Turkish language, which was undertaken at the instigation and under the direction of the famous Levin Warner, Dutch ambassador at the court of the sultan at that period; and the translation appears to have been completed about the year 1666, the same year in which Seaman's translation of the New Testament into Turkish was published at Oxford.

The Armenians have a translation of the Old Testament, done from the Septuagint, by Moses Grammaticus, and two others, about 1400 years ago. In 1666, under the direction of an Armenian bishop, it was printed at Amsterdam, corrected or corrupted from the Vulgate. Theodorus Patreus procured an impression of an Armenian New Testament at Antwerp in 1668, and of the whole Bible in 1690. In 1815, the Armenian Bible, in quarto, for the accommodation of the Armenian inhabitants of Russia, who subscribed liberally for the undertaking, was printed at St Petersburg. The Armenians are scattered all over Asia.

The Georgians have the Bible in their ancient language; but that being now almost obsolete, and themselves, in general, brutishly ignorant, few of them can either read or understand it. There has never been, till lately, but one edition of the Georgian Bible; it was printed at Moscow in 1743, in a large folio volume.

The modern Greeks have recently received the New Testament in their proper tongue, which is considerably different from that in which the sacred work was originally written. The edition is in the Hellenestic and Romaic dialects, and was printed in England under the direction of a society. It has been approved of by the Patriarch of the Greek church.

The Russians have the Bible in their Sclavonic tongue, done from the Greek by Cyril, their apostle. It was published in 1581, but being too obscure, Ernest Glük, a Swedish captive, above one hundred years ago, began to form another. He died before he finished it. Peter the Great ordered a number of his most learned clergy to complete the work; and it is supposed that the Bibles distributed by imperial authority about 1722 were of this translation. In the course of *two hundred and sixty years*, from the time when printing was first introduced into Russia, no more than twenty-two editions of the Sclavonian Bible had appeared, prior to the year 1815, consisting of about *fifty thousand copies* only.

The most ancient German translation is that of Ulphilas, bishop of the Goths, about A.D. 360; but he left out the Books of Kings, lest they should have excited his savage countrymen to war. Towards the end of the 16th century, Junius professed to publish an edition of it, from a manuscript found in the abbey of Verden, written in letters of silver. An anonymous version was printed at Nuremberg in 1477. Between 1521 and 1532, Luther composed his translation, but Michaelis, La Croze, and Bayer, think this was not from the Gothic version of Ulphilas, but one about 200 years later; he published it in seven parts, as it was ready. Some persons of quality, masters of the German language, revised it. Two Catholic versions, the one of Eckius on the Old, and Emzer on the New Testament, and another of Ulembergius, were published to depress the credit of Luther's; but the Protestants of Germany and Switzerland still use it, a little corrected. About 1604, Piscator turned the Latin translation of Junius and Tremellius into a kind of German, but too much Latinized. About 1680, Athias published a Hebrew-German translation of the Old Testament, for the sake of his Jewish brethren, and Jekuthiel another; but both, especially the latter, distorted several texts relative to the Messiah, &c.

The first Polish version of the Scriptures is ascribed to Hadewich, the wife of Jagellon, Duke of Lithuania' who embraced Christianity A.D. 1390. In 1596, the Protestants published another, formed on Luther's translation. There were three other versions, one by James Wick, a Jesuit, and the other two by Socinians, published in the end of the 16th century.

About 1506, the Bohemian Taborites published a Bible in their language, done from the Vulgate. In the end of the 16th century, eight Bohemian divines, after a careful study of the original languages, at Wirtemberg and Basil, published a version from the original text.

In 1534, Olaus and Laurence published a Swedish Bible, done from Luther's German translation. About 1617, Gustavus Adolphus ordered some learned men to revise it; and it has been, since, almost universally followed in that kingdom. The translation into the language of Finland is thought to have been done from it. In 1550, Peter Palladius, and three others, published a Danish version, done from the German of Luther; and there are one or two others, as also a version in the Icelandic tongue.

The Flemish or Dutch Bibles, composed by Roman Catholics, are very numerous; but the names of the translators are scarcely known, except that of Nicolas Vink, in 1548. The Calvinists of the Low Countries long used a version done from Luther's; but the Synod of Dort appointed some learned men to form a new one from the originals. It was published in 1637, and is considered very exact.

Since the Reformation, a vast number of Latin versions of the Bible have been made by members of the Romish church. Pagnin the *Dominican* was the first after St Jerome who translated the Old Testament into Latin from the Hebrew. His version was printed at Lyons in 1528. It is very literal, and generally exact. Arias Montanus retouched it, and made it yet more literal. After Pagnin came a crowd of interpreters, since the Hebrew language has been more studied. Leo of Judah, who, though not a Jew, understood Hebrew extremely well, began one, which has since been printed at Zurich; but death having prevented him from finishing his work, Theodorus Bibliander completed it. This is the version which Robert Stephens printed with the *Vulgate* and Vatablus's Notes, without naming the authors of it. Of Protestants, Emmanuel Tremellius, who of a Jew became a Christian, and Francis Junius, have also given a Latin translation, as also Castalio and Beza. These are considered tolerably exact, and have been frequently reprinted. Sebastian Munster also published a literal but judicious translation.

In 1471, an Italian Bible, done from the Vulgate, by Nicolas Malerme, a Benedictine monk, was published at Venice. Anthony Bruccioli published another in 1530, but the Council of Trent prohibited it. The Protestants have two Italian versions—the one, which is rather a paraphrase than a translation, by the celebrated Diodati, published in 1607, and with corrections in 1641—the other by Maximus Theophilus, and dedicated to the Duke of Tuscany, about 1551. By an order of King James of Arragon to burn them, we find there were a number of Bibles in Spanish, about the year 1270, probably the work of the Waldenses. About 1500, a Spanish version was published, but the translator's name is unknown. In 1543, Driander published his version of the New Testament, and dedicated it to the Emperor Charles the Fifth. In 1553, the Jews published their Spanish version of the Old Testament, after having long used it in private. Cassiodore, a learned Calvinist, published his Bible in 1569, which Cyprian de Valera corrected and republished in 1602.

Peter de Vaux, chief of the Waldenses, published the first translation of the Bible in French, about A.D. 1160. Two others were published about the years 1290 and 1380; and in 1550, by order of the Emperor Charles the Fifth, the doctors of Louvain published another. There are various other French versions, particularly of the New Testament; that of Mons, done from the Vulgate, and published in 1665, with the King of Spain and Archbishop of Cambray's licence, is in a most clear and agreeable style. In 1702, F. Simon published his New Testament, with some literal and critical notes, which the Bishops of Paris and Meaux quickly condemned.

There are many French versions of the Bible done by Protestants. Faber's translation of the New Testament was printed for those of Piedmont, in 1534. Next year, Peter Olivetan's Bible was published at Geneva, and, having been often reprinted with the corrections of Calvin and others, it is now a work of considerable exactness. After some struggling with the French Protestant clergy, Diodati published his in 1644; but, like his Italian and Latin versions, the translation is too free and paraphrastic. Le Clerc published his New Testament at Amsterdam in 1703, with notes mostly borrowed from Grotius and Hammond. The States-General prohibited it, as inclining to the Sabellian and Socinian heresies. La Cene published another, which shared much the same fate, on account of its fancies and errors.

The Bible, or at least portions of it, principally by the labours of the missionaries at Serampore, are now printed in nearly *forty* Indian languages, and are also to be found in Tartar, in Calmuc, and in Chinese. Upon the whole, out of the 3064 languages which are said to exist in the world, the Bible is now to be found in *one hundred and thirty-nine*.

* *Polyglott* is a Greek compound word, signifying *many tongues*, and is employed as a title for certain modern editions of the Scriptures, printed in divers languages.

GREECE.

The new independent kingdom of Greece, as now established, will probably be the smallest in the world, both in territory and in population. It includes all the country lying south of a line drawn from the Gulf of Volo to that of Arta (anciently the Sinus Ambracius), together with several of the islands of the Archipelago. Its utmost length, from north to south, is about two hundred miles; its greatest breadth scarcely one hundred and sixty. The population is even more scanty than this unexampled exiguity of boundary would lead us to imagine. It has been stated by various writers at all amounts between five hundred thousand and two millions. The probability is, that it cannot exceed six hundred thousand at the present moment; though, as soon as the new government is firmly seated on the throne, and some tolerable prospect of stability and security held out, the immigration will be immense from all quarters, especially from Thessaly and Albania; and it may reasonably be expected that, in a very few years, regenerated Greece will double its population by this means alone.

The whole country presents, to a fanciful eye, the appearance of a troubled sea, which has been congealed by some magic touch at the moment of its wildest turbulence. The mountains follow on each other in such quick succession as to leave no room for flat land, except near the sea, and in a few vallies in the interior, which have been gradually formed into plains by the accumulated deposits which torrents have washed down from the surrounding hills. The only plains of any extent or fertility which I noticed throughout Greece, were those of Argos and Marathon, both of which border on the sea; and those of Mantinea and Megalopolis, in the centre of the ancient Arcadia. Many of the mountains, especially in the Morea, are very high and difficult of access, and their summits are covered with snow till a late period in the spring. But they are often enriched by extensive forests of oak and fir, and afford excellent pasture for the flocks of sheep and goats, which still furnish the chief wealth and occupation of a large proportion of the modern Greeks.

Throughout Greece, with the exception of two or three plains, the soil is generally light, poor, and stony, and better fitted for the growth of vines than any more requiring crop. This may be owing, in a great measure, to the extreme scarcity of water, which is one of the chief disadvantages with which Nature has compensated the loveliness of scenery and richness of climate she has bestowed on this delightful land. With the single exception of the Acheloüs, all the most celebrated rivers of Grecian mythology, such as the Alpheus, the Eurotas, the Inachus, are mere insignificant streamlets. Arcadia, however, and, to a certain extent, Laconia also, are exceptions; and in the former province, the numberless rivulets which water every dell, form one of the chief features which have contributed to render it the paradise of poetical imaginations.

"Were any one," says Heeren, "who is entirely unacquainted with the history of the Greeks, to examine the map with attention, he could hardly remain in doubt that their country is favoured by nature beyond any other in Europe." It lies in a southern latitude, and enjoys a rich, genial climate, the excessive heats of which are mitigated by the mountainous character of the land, and by the vicinity of all parts of it to the sea, which surrounds it on every side, and penetrates it in every direction. In Attica especially, and in many parts of Arcadia, the air is always clear, keen, and invigorating; and to this, in a great measure, we are to attribute the unrivalled preservation of the monuments of Grecian art. Further, the combination of high land with a southern latitude, enables Greece to produce almost every variety of vegetable life which is to be found in the temperate zone. The corn of the Morea has long been held in high estimation, and in better times was exported in considerable quantities to the adjoining islands. The oil of Attica, and other provinces, is notoriously plentiful and excellent, needing only the care and cultivation which a settled government will enable and encourage the people to bestow, in order to equal, and probably surpass, that of Italy and the Ionian Isles. The honey, both of Athens and the Morea, has long been an esteemed article of export; figs, oranges, and lemons, are cultivated with the greatest success; and the wines of the islands, and also of the continent, though generally ruined for European palates by the manner of their preparation, naturally possess a rich and delicate flavour, and will ultimately, I doubt not, become a most important article of commerce. Greece produces already considerable quantities of wool, and some kinds of it are said to rival those of Spain; while the cultivation of silk, cotton, and tobacco, might be almost indefinitely increased. Add to this, that the multitude of excellent sea-ports with which Greece abounds, and their proximity to every part of the country, give her natural commercial advantages possessed by no other nation; and that the skill and enterprise of the Greeks have made them, under every disadvantage, unquestionably the best sailors in the Levant: and we see a reasonable prospect, that, as their resources are gradually developed, they will take rank among the most active and intelligent commercial people of Europe.

The beauty of Grecian scenery is beyond parallel and beyond description. In this only have poets not exaggerated. Many of the most beautiful scenes are mentioned in the course of the work, and it would be superfluous to describe them here. But there is one which must not be passed over. It is remarked by Bartholdy, in his Travels in Greece, as a curious circumstance in the history of national character, that the Athenians, gay, elegant, and often effeminate, whose luxurious tastes and tendencies rivalled those of the Sybarites, inhabited a bleak province and a barren soil; while the stern and forbidding virtues of the Spartans were born and matured amidst scenery of unequalled luxuriance and softened beauty. It is scarcely possible to conceive a landscape of richer loveliness than the plain of Sparta presents. It is well cultivated, and covered with thick groves of olives, mulberry, and lemon-trees. When I visited it in the spring, these were in full blossom, and diffused a luscious sweetness, which invited to far different sentiments from those of Spartan self-denial. The ruins of the ancient city occupy one side of the plain, and on the other, the town and fort of Mistra rise along a steep acclivity, while Mount Taygetus towers abruptly and immediately behind. The scene cannot be rendered by any description; but it is well worthy of a visit to the Morea for its sake alone. Individual spots there may be in other countries which surpass any thing to be met with either in Greece or the Ægean Islands. But here *every* scene is beautiful, and its beauty is of the highest order. The traveller is constantly surrounded by the richest loveliness of unassisted nature, occasionally intermingled with the monumental traditions of an earlier day—he lives in a perpetual rapture; and when at length he is withdrawn from the witchery of this land of enchantment, and looks back upon its charms with a fancy somewhat calmed by time and distance, he almost wonders at his own enthusiasm.*

* From Sketches in Greece and Turkey. Ridgway, London, 1835—a work which we strongly recommend to attention.

LONG VITALITY OF SEEDS.

There are few things more curious than the fact, that the seeds of various plants and flowers which have lain dormant, at a depth under the surface of the earth, for a succession of ages, have germinated, either by being exposed to the air, or the action of some compost or manure.

White, in his "Natural History of Selborne," remarks on this subject—"The naked part of the hanger is now covered with thistles of various kinds. The seeds of these thistles may have lain probably under the thick shade of the beeches for many years, but could not vegetate till the sun and air were admitted. When old beech trees are cleared away, the naked ground, in a year or two, becomes covered with strawberry plants, the seeds of which must have lain in the ground for an age at least. One of the *slidders*, or trenches, down the middle of the hanger, close covered over with lofty beeches nearly a century old, is still called *strawberry* slidder, though no strawberries have grown there in the memory of man. This sort of fruit did once, no doubt, abound there, and will again, when the obstruction is removed."

A striking instance occurred in trenching some ground for a plantation at Bushy Park, which had been undisturbed by the spade or plough since, and perhaps long before, the reign of Charles the First. The ground was turned up in the winter, and in the following summer it was covered with a profusion of the tree mignionette, pansies, and the wild raspberry, plants which are nowhere found in a wild state in the neighbourhood; and in a plantation recently made in Richmond Park, a number of foxgloves appeared, after the soil had been deeply trenched. Mr Jesse noticed an occurrence of the same kind, in a plantation in Devonshire, the surface of which was covered with the dark blue columbine, which is a common plant in the western counties in a wild state. A field, also, which had previously little or no Dutch clover upon it, was covered with that plant, after it had been trampled upon and fed down by horses.

It is well known that if a pine forest in America were to be cut down, and the ground cultivated, and afterwards allowed to return to a state of nature, it would produce plants quite different from those by which it had been previously occupied. So completely, indeed, is the soil impregnated with seeds, that if earth is brought to the surface, from the lowest depth at which it is found, some vegetable matter will spring from it.

The plant called *Hypeocoum procumbens* was lost in the Upsal garden for forty years, but was accidentally resuscitated by digging the ground which it had formerly occupied. A species of *Lobelia*, which had been missing for twenty years in the Amsterdam garden, was unexpectedly recovered in the same manner. There is a very curious account in Monson's *Perludia Botanica*, of the appearance of a species of mustard, *Sisymbrium iris*, after the fire of London; and another species, *Sisymbrium panonicum*, made its appearance suddenly among the ruins, after the fire of Moscow, and continues abundant there ever since. In Glamorganshire, Wales, a crop of barley was produced, where oats had been sown, and the farmer to whom it belonged declared that the ground had not been stirred for thirty years before; so that the seeds must have been all that time lying in a dormant state.

Several years ago, when some labourers were borin for water, near Kingston-on-Thames, earth was brought from a depth of three hundred and sixty feet. This earth was carefully covered over with a hand-glass, to prevent the possibility of any other seeds being deposited upon it, yet, in a short time, plants began to germinate from it. If quick lime be put upon land, which from time immemorial has produced nothing but heather, the heather will be killed, and white clover spring up in its stead.

There is an old castle, near Moffat, which belonged to the Regent Murray. Some of the lands which surround it are covered with peat, of about six or eight inches in thickness, under which there is a stratum of soil, supposed to have been cultivated as a garden in the time of Murray. Some years ago, the turf was removed and the soil turned up, from which sprang a variety of flowers and plants; several of them are but little known in Scotland even at the present time.

In the year 1817, Sir Thomas Dick Lauder, Bart., made some curious and very interesting experiments on the germination of seeds. "A friend of mine," says he, "possesses an estate in this county, a great part of which, lying along the Moray Frith, was, at some period not very well ascertained, but certainly not less than sixty years ago, covered with sand, which had been blown from the westward, and overwhelmed the cultivated fields, so that the agriculturist was forced to abandon them altogether. My friend, soon after his purchase of the estate, began the arduous but judicious operation of trenching down the sand, and bringing to the surface the original black mould. These operations of improvement were so productive as to induce the intelligent and enterprising proprietors to undertake, lately, a still more laborious task, viz. to trench down the superincumbent sand, on a part of the property where it was no less than eight feet deep.

"Conceiving this to be a favourable opportunity of trying some experiments relative to the length of time which seeds preserve their power of vegetation, even when immersed in the soil, I procured from my friend a quantity of the mould, taken fresh from under the sand, and carefully avoiding any mixture of the latter. This was instantly put into a jar, which was stopped up close, by means of a piece of bladder tied tightly over its mouth. Having prepared a couple of flower-pot flats, by drilling small holes in the bottom of them, so as to admit of the ascent of water, I filled the flats with some of the mould, and, placing them in a very wide and shallow tub, made on purpose, I covered each of them with a large glass receiver. Each receiver, however, was provided with a brass rim, having little brass knobs on it, so as to raise its edge from the bottom of the tub, and leave a small opening for the admission of air. The whole apparatus was placed in my library, of which the door and windows were kept constantly shut. This was done on the 17th of February last. It is now the 6th of May (1817); and on examining the flats, I find about forty-six plants in them, apparently of four different kinds; but as they are yet very young, I cannot determine their species with any degree of accuracy."

Sir Thomas Dick Lauder, who is ever ready to communicate information to his fellow men, has kindly informed us that the following were the plants which germinated. They were all of a highly oleaginous nature, and consisted of the mouse-ear, the scorpion-grass, the red archangel, and the corn spurrey. The lands from which this earth was obtained were those of Inverugie.

It is a curious fact, in proof of what has been advanced, that more recent deposits of earth, such as peat, leaf-mould, &c. produce little or no vegetable substances, while, as has been shown, soil, from whatever depth it is brought, is impregnated with seeds, which grow freely on being exposed to the influence of light and air.

Besides the wonderful duration of the germinative power of the seeds of plants, when buried at a depth in the soil, they are found to have the power of reproduction when kept out of soil for a long series of years. Mrs Selby of Twizzell, in the county of Northumberland, a lady distinguished for her zeal as a florist, and for her many domestic virtues, has experimented on the growth of flower seeds to a considerable extent. She informed us, in 1822, that she had never failed in germinating flower seeds, however old they may have been. On one occasion, she begged of a friend a few duplicates of exotic seeds, which had for many years been kept in a bottle on a mantelpiece, along with some shells, and, in this situation, subjected to the drying heat of the fire, and great variety of change in temperature, yet, nevertheless, she succeeded in producing plants from all of them.

The Society for the Encouragement of Horticulture in Prussia, proposes, from time to time, certain questions, to which it directs the attention of horticulturists. The following was proposed in 1829:—"Is it true that seeds of the melon and cucumber, being preserved for some years, yield a greater abundance of fruit?" Most observers have remarked, on this head, that plants obtained from the seeds of the preceding year produce many leaves, but few fruitful flowers, and, what is curious, almost entirely male ones; but that these same seeds, dried by the heat of the sun or of a stove, yield more fruitful plants, and

that it is particularly at the end of some years they acquire this property. These experiments vary from three to twenty years. The heat of the human body may be useful, but it must be used with discretion, or the germinating power of the seeds will be destroyed.

M. Schmidt employed seeds of from five to twelve years old, which germinated, but he found that those twenty years old did not grow. Professor Sprengel, of Halle, says he obtained no fruit from seed a year old. On the other hand, M. d'Arenstorff, of Drebleau, obtained fruit most remarkable for flower and size from seed of twenty years old. The same results were obtained by Professor Treveranus, of Berlin.

M. Voss, head gardener at Sans Souci, sowed, on the 7th February 1827, twenty-four seeds of a Spanish melon of the year 1790, being, consequently, thirty-seven years old, and he obtained eight plants which produced good fruit. This experiment was the most remarkable of all. He obtained plants from eleven kinds of seeds of different species of a less age. Cucumber seeds of seventeen years old afforded the same results.

FRANKLIN'S EXPEDITION.

To continue the narrative of Franklin's expedition: On the return of Dr Richardson and Hepburn to the party in October, the melancholy tale of what had befallen them was thus described by the Doctor:—It appears that, on the first two days, they had nothing whatever to eat, that on the evening of the third day, Michel, the only surviving man of the four whom Captain Franklin had sent back, arrived with a hare and a partridge, which enabled them to break their long fast. Another day passed without eating; Mr Hood very weak and unwell. On the 11th, Michel brought them part of what he called a wolf, which he said had been killed by the stroke of a deer's horn. "We implicitly believed this story then," says Dr Richardson, "but afterwards became convinced, from circumstances, the detail of which may be spared, that it must have been a portion of the body of Belanger, or Perrault," two of the unfortunate men whom Captain Franklin had sent back, and one or both of whom it was strongly suspected had fallen by the hands of the Iroquois. This man's bad conduct since his return grew daily worse; he absented himself from the party; refused either to hunt, or to fetch wood, and frequently threatened to leave them. Poor Hood was now sinking fast; he was unable to eat the tripe de roche (and they had nothing else), on account of the constant griping it produced.

"At this period we avoided as much as possible conversing upon the hopelessness of our situation, and generally endeavoured to lead the conversation towards our future prospects in life. The fact is, that, with the decay of our strength, our minds decayed, and we were no longer able to bear the contemplation of the horrors that surrounded us. Each of us, if I may be allowed to judge from my own case, excused himself from so doing by a desire of not shocking the feelings of the others, for we were sensible of one another's weakness of intellect, though blind to our own. Yet we were calm and resigned to our fate, not a murmur escaped us, and we were punctual and fervent in our addresses to the Supreme Being."

Five days more passed on without any food except a little tripe de roche collected by Hepburn, the Iroquois continuing sulky, and, though strongest of the party, refusing to contribute to its relief; but it was strongly suspected he had a hidden supply of meat for his own use. Seeing the determined obstinacy and refractory spirit of this man, Dr Richardson had told him, that if no relief came from Fort Enterprise before the 20th, Hepburn and himslf should be dispatched thither with a compass, by the direction of which they might be enabled to find the house. On that very day, however, as Hepburn was cutting wood near the tent, and Dr Richardson was collecting tripe de roche, the miscreant assassinated Mr Hood while sitting over the fire in the last stage of disease and debility. The ball entered the back part of his head, and set fire to his nightcap. Hepburn had heard them conversing together in an angry tone, and immediately after, the report of a gun; and on looking towards the spot, observed Michel rise from behind the spot where Mr Hood had been sitting, and dart into the tent. It was at once clear, from the great length of the gun which had been discharged, that such a wound could only have been inflicted by a second person; and if any doubt could have existed as to the murderer, Michel's own conduct would at once have removed it. From this time he would never suffer the two remaining of the party to be together for a moment; he was constantly asking if they suspected him of the murder; sometimes he made use of threatening language; at other times muttering to himself, and throwing out obscure hints of freeing himself from all restraint. In short, as they proceeded on their dismal journey to join their companions at Fort Enterprise, his conduct became so violent and outrageous as to convince both the Doctor and Hepburn that he would attempt to destroy them the first opportunity that offered. His strength was superior to theirs united, and he had, besides his gun, two pistols, an Indian bayonet, and a knife. On coming to a rock, he for the first time left them together, saying he would stop to gather some tripe de roche, and desired them to go on. Hepburn now mentioned certain circumstances, which satisfied Dr Richardson that there was no safety for them but in his death, and he offered to be the instrument of it. "I determined, however," says Dr Richardson, "as I was thoroughly convinced of the necessity of such a dreadful act, to take the whole responsibility upon myself; and immediately upon Michel's coming up, I put an end to his life by shooting him through the head with a pistol. Had my own life alone," he continues, "been threatened, I would not have purchased it by such a measure; but I considered myself as entrusted also with the protection of Hepburn's, a man who, by his humane attentions and devotedness, had so endeared himself to me, that I felt more anxiety for his safety than for my own." Michel had gathered no tripe de roche; and it was quite evident that he had halted for no other purpose than that of putting his gun in order, to destroy them that same evening while engaged in setting up the tent.

Dr Richardson seems to have no doubt that a very short time must have put an end to the sufferings of Mr Hood. On his zeal, ability, and goodness of heart, both he and Captain Franklin bestow unqualified praise. "The loss," says the former, "of a young officer of such distinguished and varied talents and application, may be felt and duly appreciated by the eminent characters under whose command he had served; but the calmness with which he contemplated the probable termination of a life of uncommon promise, and the patience and fortitude with which he sustained, I may say, unparalleled bodily sufferings, can only be known to the companions of his distresses."

After dragging along their famished bodies for six days, existing on lichens and pieces of the skin-cloak of poor Mr Hood, on the 29th they came in sight of the fort at dusk; "and," says Dr Richardson, "it is impossible to describe our sensations, when, on attaining the eminence that overlooks it, we beheld the smoke issuing from one of the chimneys. From not having met with any footsteps in the snow, as we drew nigh our once cheerful residence, we had been agitated by many melancholy forebodings. Upon entering the now desolate building, we had the satisfaction of embracing Captain Franklin, but no words can convey an idea of the filth and wretchedness that met our eyes on looking around. Our own misery had stolen upon us by degrees, and we were accustomed to the contemplation of each other's emaciated figures; but the ghastly countenances, dilated eye-balls, and sepulchral voices of Mr Franklin and those with him, were more than we could at first bear.

An idea may be formed of the dreadful state to which the captain's party were reduced, by the death of two of them, two days after the arrival of Dr Richardson and Hepburn. The only remaining man and Captain Franklin were so utterly unable to assist themselves, that eight-and-forty hours, and probably half that time, would have put an end to their misery. The whole labour, therefore, of procuring fire-wood, and scraping together the old pieces of skins, and fragments of bone, devolved on Dr Richardson and Hepburn, whose strength was now rapidly declining, and very nearly exhausted, when, providentially, on the 7th of November, the long-expected relief arrived, by the hands of three Indians sent by Mr Back. The condition to which the four survivors were reduced is thus described by Captain Franklin:—

"I may here remark, that, owing to our loss of flesh, the hardness of the floor, from which we were only protected by a blanket, produced sorenesss over the body, and especially those parts on which the weight rested in lying, yet, to turn ourselves for relief was a matter of toil and difficulty. However, during this period, and indeed all along after the acute pains of hunger, which lasted but three or four days, had subsided, we generally enjoyed the comfort of a few hours' sleep. The dreams which for the most part, but not always, accompanied it, were usually (though not invariably) of a pleasant character, being very often about the enjoyments of feasting. In the day time we fell into the practice of conversing on common and light subjects, although we sometimes discussed with seriousness and earnestness topics connected with religion. We generally avoided speaking directly of our present sufferings, or even of the prospect of relief. I observed that, in proportion as our strength decayed, our minds exhibited symptoms of weakness, evinced by a kind of unreasonable pettishness with each other. Each of us thought the other weaker in intellect than himself, and more in need of advice and assistance. So trifling a circumstance as a change of place, recommended by one as being warmer and more comfortable, and refused by the other from a dread of motion, frequently called forth fretful expressions which were no sooner uttered than atoned for, to be repeated perhaps in the course of a few minutes. The same thing often occurred when we endeavoured to assist each other in carrying wood to the fire; none of us were willing to receive assistance, although the task was disproportioned to our strength. On one of these occasions Hepburn was so convinced of this waywardness, that he exclaimed, 'Dear me, if we are spared to return to England, I wonder if we shall recover our understandings.'"

Nothing could be kinder and more humane than the conduct of the Indians. They cleaned out the room, cooked their victuals, had them washed and made comfortable, and, after leaving the fort, attended them to the spot where their tribe were engaged in hunting; giving up their own snow-shoes, keeping by their sides, lifting them up when they fell, and finally conducting them in safety to the nearest of the Company's posts, where they met with their companion, Back, whose sufferings had scarcely been less than their own, and to whose exertions the survivors of the party unquestionably owed their safety. One of the two Canadians who had accompanied Mr Back fell a sacrifice to cold, hunger, and fatigue.

RURAL AFFAIRS.

In the year 1806, I was one afternoon leaning over the grave of Burns, and reading the plain inscription on his tombstone erected in the churchyard of Dumfries. This town was the concluding scene of the Scottish bard, and here terminated the breathings of his muse and of his life. I was indulging in one of those moods, in which pain and pleasure are so equally blended, that the mind is thrown into a sort of delightful melancholy; for while I traced many gay and lively recollections, I was forced by present objects to check the rising emotions, and embitter them with grief. His enchanting and splendid verses were contrasted, in the eye of fancy, with the shades of his character; the bright and promising morning of his life with the ominous and black cloud which settled on the evening of his days. While indulging in these feelings, a slow and faltering step struck my ear, and, turning round, I discovered an emaciated but venerable figure approaching, in the last decrepitude of old age.

"Stranger," said he, "you are paying the tribute of respect to the memory of our poet, and I must beg pardon for this abrupt intrusion." There was such an air of good nature in the old man, heightened by the sense of his helplessness, that I addressed him frankly in reply, and showed no reluctance to engage in conversation.

"Come," said he, "along with me to the hillock which Burns used to visit." I accompanied him, and we ascended together the mound of earth, on the top of which is the seat, once the favourite haunt of this immortal and extraordinary genius. It is still shown to the curious, lies within the precincts of the town, and commands a fine prospect of the surrounding country. We seated ourselves on the grassy turf; and, grown familiar by an interchange of sentiment, we conversed on the most intimate footing. From Burns we soon passed to other topics possessing novelty or interest.

"The country," said I, "in every direction around, and wherever I have travelled, is mostly arable, and highly cultivated. The red and white wheats prevail universally, and are sown seemingly by the farmers in equal quantities."

"Yes," replied the old man; "there is a wonderful change in this district since I was of your age; for I can recollect the time when there were neither enclosures nor wheat in all this country."

"Is it possible," I answered, "that all these improvements are of so recent a date as to be within the reach of your remembrance? I should like if you would relate to me the ancient state of the country, the condition of the tenants, and the progress of agriculture."

"That I shall do with all my heart," rejoined my acquaintance, his eyes brightening as he spoke, for, like myself, he seemed fond of the subject.

"I was born," continued he, "in 1719, in Lochmaben, and am now eighty-seven years of age. The oldest thing I recollect is the great riot which took place throughout the whole of this shire in 1724, in consequence of the landed proprietors beginning to enclose their estates, on purpose to stock them with black cattle. The small tenants were turned out to make way for this improvement, and the ground was fenced by a sunk ditch and wall, called then park-dykes. Great distress was felt in the country on account of this alteration; and the tenantry rose in a mob, and, with pitchforks, spades, and mattocks, proceeded to level all these enclosures, from the one end of the country to the other. My father was, unfortunately, concerned in that disturbance; and after it was quelled by the help of two troops of dragoons brought from Edinburgh, he was banished to the American plantations for his crime. I lived afterwards, and was brought up, with my uncle in Nithsdale, about twenty miles hence, who rented there a small farm of a hundred acres, and I assisted him in working it. The general produce of all this country was grey oats, although the gentlemen in their croft or best lands raised also a little beer or bigg, and some white oats; yet the soil was by all men believed incapable of producing wheat, and accordingly it was never tried. Our common food consisted of these grey oats parched, or burned out of the ear, and ground in a hollow stone by the hand; of milk; of kail; of groats; with never more than one ewe, killed at Martinmas for the family. The houses were generally built of mud, and covered with thatch; and the clothing was of plaiding—a coarse tweeled stuff, manufactured at home from the black and white wool mixed together. Hats and shoes were only worn by the gentry; and even they often appeared at church with a coat of their wives' making. Potatoes were not introduced till 1725, and at first were cultivated with much care, and in small patches. They were carried to the great towns on horses' backs, and retailed at a high price by pounds and ounces. It was about the year 1735, when they came into com-

mon use; and before that period there was often great scarcity of food, sometimes bordering on famine, in this fine country, which was then accounted incapable of raising bread for its scanty population. Dumfries at present contains more inhabitants than were then in the whole county: and twenty acres are now more productive than two hundred in those days. Such was the low state of husbandry, that the principal supply came from Cumberland, on the other side of the Esk; and I myself have witnessed on the Wednesdays, which from time immemorial have been our market days, sad scenes of real distress occasioned by the swelling of the river, which prevented the carriers from bringing forward the meal; as the want of bridges often interrupted all communication.

"I have seen," proceeded the old man with greater animation, and pointing with the staff in his hand, "all that country before us covered and overgrown with whins and broom, and not a single vestige of these hedges and stone walls which cross and intersect the whole landscape. A few sheep and black cattle picked the scanty herbage, and they were prevented from eating the growing corn, either by a herd-boy who tended them, or by a temporary fence erected every year. The common people very often collected nettles in the field, of which they made a kind of coarse soup thickened with oatmeal, and enriched, on great days, by a piece of butter as a luxury The state of Scotland from my birth up to 1745 was miserable in the extreme: the lower classes were ill fed, ill clothed, and ill lodged, and there was no revival in their circumstances till the introduction of potatoes and lime."

"Of potatoes and of lime!" repeated I; "I can perceive some reason why the first should improve their condition, but what connection had the last with it?"

"Lime," continued my instructor, "operated with more success on the prosperity of the country than potatoes, and I look upon it as the best friend we ever saw."

"Explain yourself," said I; "for all this seems mysterious, and I cannot conceive how lime could have wrought such enchantment."

"To your satisfaction, then, I shall account for it; and my present views have not been altered for the last twenty years of my life. Seventy years ago, in 1738, there was no lime used for building in Dumfries, except a little made of cockle shells, burnt at Colvend, and brought on horses' backs a distance of twenty-two miles. All the houses were either composed of mud walls, strengthened by upright posts, and these bound and connected together by wattled twigs, or they were built of stone, laid, not in mortar, but in clay or moist loam. The whole town was a collection of dirty, mean, and frail hovels, never exceeding one story, because the materials had not strength or firmness to bear more. These buildings were so perishable, and stood in need of such constant propping, that people never thought of expending time, labour, and money on the comforts of a habitation which was to fall into ruins during the course of their lifetime. Old Provost Bell's house, which was founded in 1740, is the only one now remaining of the ancient town; and although the under story was built with clay, the two upper were laid in lime, which is the cause of its long standing.

"Between the years 1750 and 1760, the old mud walls gave place to those of stone laid in mortar, and from that period there has been a visible and rapid improvement. Houses acquired permanence, descended from father to son, and the labours of one generation were enjoyed by the next. To lime, then, we owe these stately edifices, with all the comforts and conveniences they confer; and it hence contributed, in a remarkable degree, to the refinement and polish of private life.

"If to this fossil," continued the old man, "we are indebted for the stability of our towns, we are under greater obligations for its unprecedented effects on the powers of the earth. Wheat and clover would not thrive in the county of Dumfries, or in the stewartry of Kirkcudbright, till lime was plentifully incorporated with the soil; and after its introduction, the farmers became rich, land advanced in value, the produce was multiplied tenfold, population increased, and these counties quickly rose to their present unexampled prosperity. In my younger days, it cost much toil to raise on my uncle's farm two bolls or two bolls and a half of grey oats per acre, and after taking one or two crops, the ground lay for four or five years in natural grass, which was coarse, and unpalatable to the cattle. The rent—only 2s. 6d. per acre—we found great difficulty in scraping together, and we fell on a thousand shifts to accomplish it. Now, the same farm is rented at L.3, 10s. per acre, is kept under constant cropping, rears excellent wheat, is wholly drained and enclosed, supports a genteel family in all the comforts of life, and one year's rent of it is double the sum which could have purchased it altogether sixty-five years ago. It is lime that has warmed and meliorated the soil, that has endowed it with productive powers, and that supports all the plenty and prosperity you have been admiring, as you travelled through the district." He paused; I rose and bowed; we came down together, and I retired to my apartment in the inn, to note down the particulars of this interesting conversation.*

* This simple and instructive sketch of the changes effected in the rural management of Scotland within the last eighty years, is extracted from a valuable work on agricultural subjects, printed at Halifax, in Nova Scotia, entitled "The Letters of Agricola," &c., by John Young, who, we believe, is a native of this country.

SLAVES IN ANCIENT STATES.

It is difficult for a modern to conceive the number of slaves that existed in the most populous Greek and Italian cities. The city of Corinth, the most commercial and most opulent of Greece, possessed within her walls forty-six myriads, or 460,000. When Demetrius Phalereus took a census of the population of Athens, free, servile, and foreigners, there were found 21,000 citizens, 10,000 domiciled foreigners, and no less than 400,000 slaves. Nicias had 1000 slaves, which he hired out to work in the silver mines of Thrace, at an abolus, or 1½d. a-day. The Æginatæ, a trading people, possessing many ships, but a very small territorial limit, possessed, according to Aristotle, 470,000. Some of the citizens of Dardanus possessed more than 1000 slaves. Many Roman families had 10,000 or 20,000, or even more, and these were kept and maintained by them not always for gain, but sometimes for mere show and attendance. Smindyridas, a native of Sybaris, a town celebrated for its voluptuousness and accomplished luxury, took along with him, when he went to his marriage, 1000 slaves, as ministrants to him, some of them cooks, some poulterers, some fishers, &c. An immense number of slaves was maintained by the free inhabitants of Sicily; they frequently mutinied against their masters, and threw the whole island into bloodshed and confusion; upwards of 100 myriads are calculated to have there perished in these dreadful conflicts for emancipation. The servile war in Italy was nearly equally destructive. At one time, 120,000 slaves were marching upon Rome, who were headed and directed by one Spartacus, a Thracian slave, who avenged the injured rights of nature upon his enslavers, and made the supremacy of Rome herself to totter under the force of his infuriated attacks. At the close of the servile war, no less than 6000 slaves were hanged up all the way from Rome to Capua. In Attica, the slaves wrought at the mines with their feet shackled. The ancient Greeks were not served in their houses by bought slaves; the younger served the elder. The city of Ephesus was founded by 1000 slaves, who ran away from Samos. It is said that Julius Cæsar crossed into Britain with but three slaves officiating as servants, and it is a strange coincidence that his body was carried home by three servants from the senate-house, where he was murdered. Cato was wont to ride from Rome to the country, in the most simple manner, with but one slave, sometimes no attendant at all—riding gently with his *walise* under him for a saddle, somewhat in the style of a modern decent Antiburgher minister.

TO A WILD FLOWER.*

In what delightful land,
Sweet scented flower, didst thou attain thy birth?
Thou art no offspring of the common earth,
By common breezes fann'd.

Full oft my gladden'd eye,
In pleasant glade or river's marge has traced,
(As if there planted by the hand of taste),
Sweet flowers of every dye.

But never did I see,
In mead, or mountain, or domestic bower,
'Mong many a lovely and delicious flower,
One half so fair as thee!

Thy beauty makes rejoice
My inmost heart. I know not how 'tis so—
Quick coming fancies thou dost make me know,
For fragrance is thy voice

And still it comes to me,
In quiet night, and turmoil of the day,
Like memory of friends gone far away.
Or, haply, ceased to be.

Together we'll commune,
As lovers do, when, standing all apart,
No one o'erhears the whispers of their heart,
Save the all-silent moon.

Thy thoughts I can divine,
Although not uttered in vernacular words;
Thou me remind'st of songs of forest birds;
Of venerable wine;

Of Earth's fresh shrubs and roots;
Of Summer days, when men their thirsting slake
In the cool fountain, or the cooler lake,
While eating wood-grown fruits.

Thy leaves my memory tell
Of sights, and scents, and sounds, that come again,
Like ocean's murmurs, when the balmy strain
Is echoed in its shell.

The meadows in their green
Smooth-running waters in the far off ways,
The deep-voiced forest, where the hermit prays,
In thy fair face are seen.

Thy home is in the wild
'Mong sylvan shades, near music-haunted springs,
Where peace dwells all apart from earthly things,
Like some secluded child.

The beauty of the sky,
The music of the woods, the love that stirs
Wherever Nature charms her worshippers,
Are all by thee brought nigh.

I shall not soon forget
What thou hast taught me in my solitude,
My feelings have acquired a taste of good,
Sweet flower! since first we met.

Thou bring'st unto the soul
A blessing and a peace, inspiring thought;
And dost the goodness and the power denote
Of Him who formed the whole.

* We have taken the liberty of extracting this beautiful little poem from the second edition (lately published) of a volume entitled "Poetical Aspirations, by William Anderson." That a poet who can write such things should be so little known, is a strong signification of the difficulty which characterises the present age, with all its advantages, of attaining almost any degree of literary celebrity.

THE "CHEAP" PUBLICATIONS.

We have had much pleasure in observing a very respectful notice of the present work, along with the Penny and Saturday Magazines, in a late number of the Edinburgh Review. Not that there is any chance of our circulation being much extended by the recommendation of this distinguished periodical, but that the article in the Review may tend to open the eyes of many persons, chiefly those connected with literature, to better views of the nature and end of the cheap sheets than what have hitherto prevailed. It has all along been to us a matter of painful reflection, that, while the reading public was fully awake to the benefits to be derived from such a vast system of popular instruction, and while our own work in particular has been honoured with an appreciation that proclaims itself as almost without parallel in periodical literature, the *writing public* has either preserved an invidious silence regarding our labours and those of our followers, or employed themselves less honourably in conveying the falsest impressions respecting our legal and literary status, insomuch that the *soi-disant* leaders of the public taste appear to be the only class in the country who remain ignorant or prejudiced upon the subject. While a moral phenomenon of the most uncommon kind was in the process of being developed—no less than the establishment of an universal national organ of literary instruction and refinement, and that by means the most simple and unpretending—men of letters seemed to have no better amusement than to sneer at so external a matter as the price of these works, to denounce them as infringing upon the newspaper laws, and to hold them up in every possible way to ridicule. One great magazine-writer—who, however, is certainly under great temptations to write nonsense, since the public seems to like nothing else of his composition—wished, in the spirit of the Caliph Omar, that the common people would content themselves, like their fathers, with the Bible. Other persons connected with the daily and weekly press endeavoured at once to prove that they were newspapers, and yet that their contents were worthless; an argument in which they certainly reflected no small credit upon their own labours. In short, the cheap publications, as they are comparatively but incorrectly termed, have been the subject of as much misrepresentation as if, instead of being obvious to every eye, they had held a more obscure course than the generality of other works. Regretting as we do that the accustomed dispensers of fame should in this case have been so obstinate and so blind, we cannot but rejoice that the Edinburgh Review has attempted to assign these publications their proper rank, seeing that the effort may be an example to others, or at least that it may avail with many who are inaccessible of all claims which do not bring with them a prestige of one kind or another.

There is one part of the article which we cannot allow to pass without special notice—the caution which the Reviewer thinks it necessary to give at the close, respecting the use which we and others may be tempted to make of larger works. To what extent the Penny and Saturday Magazines may facilitate their labours in this manner, we have never inquired; but we have to state, in our own behalf, that there is seldom any considerable portion of our columns which is copied directly from any book, and in general these extracts are of such a trivial and fragmentary nature, as to infringe upon no copyright whatsoever. The articles which appear in our "Information for the People" are as original as any articles in Encyclopædias ever are; so are the majority of those which occupy the "Journal." Our system of literary labour is, indeed, as complicated, and relatively as expensive, as that of any periodical work in the country; and even where our matter is not new, it is generally derived from American works, or from British publications which have been sent to us by the authors or publishers, in order that we might aid in bringing them into notice, or from books of a past day, in which there is no publishing interest to be injured. The limits to which the system of extracting may be carried have never yet been properly fixed either by law or custom; but since we are held by implication to be liable to some blame on this account, we may mention, that we do not copy nearly so much as many works which have never yet been challenged. The Literary Gazette, for instance, and other popular works of which it has been the respectable model, live, it may be said, by nothing else than their custom of giving extracts from all the new books of the passing week. Even the monthly and quarterly periodicals copy more in proportion than we do. Nor is the system confined to publications of this class. The extent to which historical and miscellaneous writers avail themselves of the labours of their predecessors, is beyond all calculation. A work, for instance, has lately appeared under the designation of "Waverley Anecdotes," which has been praised in most of the newspapers and literary journals; its sole merit, in reality, lies in its being an artful compound of matters from other books, among which a volume by Mr R. Chambers, published in 1822, under the title of "Illustrations of the Author of Waverley," has suffered to the amount of somewhere about a third of its whole contents—and this without the acknowledgment which we invariably make, as to the source of our quotations. Another work, now in the course of publication, respecting the Highlands, and which professes to be an improvement upon all past history, has been shown to be, in one of its sections, borrowed word for word from Chalmers's Caledonia—also without acknowledgment. Because these works do not offend by their cheapness, and are occasionally advertised in the newspapers, they are praised in many of those sheets, while we, who are most absurdly supposed to interfere with the interests of the political press, and with other literary concerns, are either directly or indirectly said to exist by a system of plunder! In truth, we would be very glad to give up the practice of quoting from even the few sources which we employ, if it were not that our readers appear solicitous to have a few extracts along with our original matter, and that we are often entreated, by way of favour, to use our freedom with certain works put into our hands by the persons most interested in them. In a brief space of time, we hope to convince the public that extracts from books, if not in every case unique and complete in themselves (which they very rarely are), are less proper to our purpose than the systematized knowledge which we condense into our more elaborate articles; and when that end is gained, it is probable that we will altogether cease to insert any thing that has ever before been printed. In the mean time we may mention, as the best proof of our having never offended against copyright, that we have not yet received a single remonstrance upon the subject from any publisher—although it is said that some of the most considerable of these individuals have resolved to prosecute the cheap works in every case where it is at all likely that they may be successful. On the contrary, we have ourselves suffered more, perhaps, at the hands of these gentlemen, than they have done from us; and if any complaint were proper, it ought rather to arise from ourselves. We allude particularly to our biographical article on Sir Walter Scott, which has been pillaged by *dear* publications of every class and calibre—very much to our satisfaction.

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER." AND "INFORMATION FOR THE PEOPLE."

No. 69. SATURDAY, MAY 25, 1833. PRICE THREE HALFPENCE.

WINDFALLS.

THERE are some medicines and intoxicating draughts which cannot, without extreme danger, be largely used at first. It is only by beginning with small doses, and by gradually increasing them, that the system becomes habituated to their qualities, and in a manner fitted for their reception, until at last the original quantity produces no perceptible effect or excitement, and copious drenchings are undergone with apparent impunity. In the same way that drugs of this kind act upon the body, the possession of wealth operates upon the mind. When money is amassed by slow degrees, by the regular profits of business, the use of it is learnt during the acquisition; but when it plumps upon a man suddenly, and he who yesterday was a hard-working tradesman, obliged to fare frugally, and to be content with coarse clothing, finds himself today the master of a fortune capable of supplying a luxurious table, splendid furniture, and rich attire, he is as it were taken by assault, reduced under subjection to a powerful invader, and frightened from his propriety, so as to be incapable of managing affairs discreetly for the future.

He who has formed a resolution to go cautiously and steadily forward in the pursuit he has chosen, accommodates his desires to the station in which it places him. There is no one, indeed, devoid of ambition; and he, like other men, hopes to better himself, and looks forward to enjoyments beyond his present circumstances: but it is by almost imperceptible steps that he advances to attain them. He does not see the full height of the mountain before him, nor pant with eagerness to reach its top; but terraced eminences present themselves successively, and with patient foot he climbs one after another, saving his breath most methodically, although his view does not extend to the next ascent. Far from losing his all upon a cast, he would not risk the merest trifle on *the chances*, and his is the heart that never fluttered responsive to the most flattering *perhaps*. His last pace is measured with the same steadiness and self-possession that characterised the whole of his progress; and, knowing every inch of ground over which he has passed, he is prepared to recede, if it should be necessary, with no less composure. Such is the character of the prudent man of business—unwearied industry being its strongest feature. All acknowledge him to be clear-headed, and many load him with the imputation of being also cold-hearted; but this is very frequently a mistake: He knows how he has got every penny he possesses, and he never parts with the smallest sum, without being assured of a good and sufficient cause for the outlay. He is not wanting in the common kindnesses and charities of life; on the contrary, he devotes the whole of his time and talents to the acquisition of means by which he may confer benefits on all who are connected with him—but they are every one sober unostentatious benefits, distributed considerately from a sense of duty, and not from any high-flown notions of generosity. By steady attention to the concerns of trade, he makes himself the stay of many industrious families, who in his service are sure of employment, and equally sure of their wages. He whose hand gives liberally to the poor is blessed; but doubly blessed is he who enables them to live without depending upon casual bounty.

The man who looks to lucky turns in trade, and makes bold ventures, is sometimes as successful as his neighbour who plods on in its regular routine; but he seldom employs his advantages so wisely for himself, and so beneficially for others. He is of a sanguine temperament, and has accustomed himself to think that money is only to be made by fortunate hits. Excitement and stir present to him charms that are irresistible; so he takes care to devise and execute a number of schemes, sufficient to keep him constantly upon the tenter-hooks of expectation. They often fail; but he is not discouraged. Persuading himself that his plans were the best possible, and conducted in the most judicious manner, he attributes their discomfiture solely to casualties which nobody could have foreseen. "If it had not been that that fellow who bought my last consignment from —— was a villain, I should at this moment have been in possession of a fortune of L.30,000," says the disappointed speculator; and he speaks truly: but he overlooks the circumstance that he sold his goods so very advantageously, that it would have been apparent to any one, not blinded by an over-eagerness of gain, that the purchaser had little intention of paying the price. A person with better regulated notions would aim rather to dispose of a great number of commodities, at moderate returns, than of a few at a large profit; but for this sure and liberal system of dealing the daring commercial adventurer entertains a sovereign contempt; a small advantage he does not think worth accepting, and accordingly his transactions are all of a hazardous kind, either issuing in a dead loss or in enormous gains. By this hap-hazard species of traffic, an immense fortune is occasionally accumulated, and may be considered in the light of a windfall to its owner, as much as if it had presented itself in the shape of an unexpected legacy. It comes upon him as unprepared to use it in moderation, and is for the most part as injudiciously squandered. Indeed, in whatever way it comes, the result is nearly the same.

"What an unfortunate wretch I am!" exclaims he who finds himself the holder of an unsuccessful lottery-ticket, "to pitch upon No. 999, when, if I had taken the one above it, I should have got the L.20,000 prize." Now, mark the bad logic of the man: he calls himself unfortunate in not selecting No. 1000, as if he were certain it would have turned out a prize *if he had held it*. But so willing is he to interpret chances in his own favour, that a doubt on this exceedingly problematical point never enters his head; and he considers himself to have been so very close upon gaining a large sum, that he is sure of it the next time he makes the trial. Well, perhaps he *does* succeed the next time, or the next, or the time after; and how does this vast influx of wealth find and affect him?—it finds him very much in need of it, and very eager to wallow in it, and, ten to one, he is soon in a worse condition than ever. This suddenly-acquired wealth does not seem to have the same blessing with it that generally accompanies the gains of patient industry, or of an honest ingenuity, exerted from day to day. Sudden wealth may be compared to a tornado, which produces nothing but havoc and desolation; the slow earnings of industry to the silent dews by whose influence the face of nature is beautified, and vegetation invigorated and refreshed.

The above arguments bear with full force upon the life of the gambler, who is simply a person given up to delusive hopes of acquiring wealth without working for it. In general, we find moral writers and dramatists, in their endeavours to check this vice, go no farther than to show the horrible results which are apt to spring from its indulgence. It might be advantageous also to explain the rational principles upon which gambling is a worse means of endeavouring to obtain money than an industrious course of life. To assume a language which will be intelligible to those who are addicted to it, it is attended with a *worse chance* of ending in the desired result. If twenty persons are engaged in one street, each in his own honest business, it is certain that some profit will be made amongst them, so that most of them, at least, will be able to exist without coming upon their capital. But if twenty persons be engaged as industriously in gambling, it is certain that no profit will be made amongst them—on the contrary, money will be lost in paying for the rooms, and for the materials of the sport. Supposing the twenty persons were kept by themselves, and that they began with a considerable stock of money amongst them, they would by and bye find themselves reduced to pennilessness, by reason of this constant drain upon their resources. Now, if money cannot be made by any community of gamblers among themselves, what hope is there, except in that vanity and self-love which speaks delusively to every bosom, that an individual will enrich himself? Evidently none whatever. Thus gambling, in every case where it does not suppose a simpleton to be pillaged, is proved a mere fallacy; while, in cases where that *is* supposed, it is the meanest, because the safest of robberies. In no point of view can there be any advantage in this course of life—for if wealth be lost, it produces all the usual evils of that contingency; if it be gained, it never thrives, and is apt to be again quickly lost, either by play, or by irregular and expensive living. Upon the whole, while some must be greater losers than others, there is no *general chance* in favour of the gambler, as there is in favour of the honest and industrious man—he is almost certain of being, in the long-run, worse than when he began. He may be compared, indeed, to a merchant who exposes his capital to an almost absolute certainty of being impaired, by assuming a line of speculations in which the chance of loss is invariably and palpably greater than the chance of gain. The only individual who can thrive by this unhappy vice is the person who keeps the gaming-house: the players, as a whole, *must* be losers.

Of all classes of society, the young are the most apt to give themselves up to a practice of longing for windfalls. The male human being, from six to sixteen, is constantly dreaming of pots of money found in the earth, or of large fortunes made in foreign adventure, after the manner of Whittington with his cat. From sixteen to four and twenty, he dreams of handsome fortunes made by the simple and rather agreeable process of taking a handsome woman to wife; and he is constantly on the outlook for such a chance of placing himself, as it is called, upon his feet. Others dream of legacies from rich and hitherto unheard-of uncles, who will be dying some of these days in India, fifty years after they had been given up by their relations for lost. *All* are *more or less* taken up by the idea of ready-made fortunes, which are to save them the trouble of making one for themselves; and, in this gasping and grasping hope of becoming suddenly enriched, they spend perhaps the time and energies which ought to be directed to better objects. We would warn our young readers against giving themselves up to these vain phantasies. The proportion of those who have been so *fortunate*, as it is called, as to fall into the possession of windfalls, is so very small, as compared with those who do not, that it ought never to be taken into account in our calculations as to the means of providing ourselves with a subsistence. If we would just reflect for a moment upon what the most of us are at our outset in life—bare, unlicked creatures, with merit all to be proved, if it really exists at all, but most probably it does not exist—merely individuals in the great herd of the beardless, none of whom seem any different from the rest—we would never flatter ourselves that there was any chance of fortune singling *us* out as her own peculiar favourites,

or of our gaining anything whatsoever, till we had somehow asserted our right to it. It is nothing but an overweening self-love, and a blindness to the degree of estimation in which, while as yet untried, we are likely to be held by the rest of mankind, that leads us into this error; and he, for certain, has the best chance of quickly investing himself with the good things of Fortune, who is soonest cured of so fatal and bewildering a delusion.

POPULAR INFORMATION ON LITERATURE.

HOMER—HERODOTUS.

It is the lot of only a limited number of persons to become acquainted with ancient literature, or to have even the slightest knowledge of the languages in which it is chiefly written. Yet, owing to the importance of Greek and Roman literature to literary men, allusions to it are found at almost every step in our perusal of modern books—to the great puzzlement of unlearned readers, and the diminution of the utility of the works in which such allusions occur. By way of obviating this evil as far as possible, we shall give a brief account of the principal ancient authors and books referred to in modern literature, calculating our language for the use of those who know *nothing* on the subject.

By ancient, or, as it is sometimes called, *classical* literature, is meant the productions, in particular, of two civilized nations, which existed, two thousand years ago and upwards, at various places on the shores of the Mediterranean. These were the Greeks and Romans, of whom some account has already been given in the present work. People are sometimes heard to express wonder how the writings of these nations should be so much relished now-a-days, disguised as they are under foreign tongues, when there are so many books of as great literary merit, and more information, written in our own language. To this it must be answered, that, when our own nation had not as yet formed a literature for itself, the works of the Greeks and Romans were the only works of merit which existed; and they were then studied with so much admiration in the seminaries where learned men were brought up, that a fixed prepossession in their favour has taken root among those classes, to the exclusion, in some measure, of a taste for even the best modern literature. Another cause of their keeping their ground so long in our schools, is the fact of our language containing a large proportion of Greek and Roman words, so that it cannot be properly studied without a previous acquaintance with those tongues. A third cause is that which has suggested the present chapter, namely, that so much of modern literature has a reference to the ancient, that there is no understanding the one without some knowledge of the other.

The first, and, as it happens, the greatest, of all the ancient writers, was Homer, the author of two long Greek poems, respectively styled the Iliad and the Odyssey. So little is known about this man, that he is by many supposed to have been altogether an ideal person, and his poems only a series of fugitive ballads which were gathered together from tradition, and arranged under his name, as Ossian's Poems are supposed by most people to have been with us. By those who believe him to have existed, he is represented as having been an old blind minstrel, who went about singing his poems for the purpose of procuring a wretched subsistence. He is said to have lived some time between the tenth and eighth century before Christ, and to have been a native of the western coast of Asia Minor, now called Natolia. Like many modern poets, he would appear to have been little regarded during his lifetime; but some ages afterwards, when the people, by greater refinement, were more able to enjoy his verses, seven cities contended for the honour of having given him birth; a ridiculous circumstance in more ways than one, seeing that the mere accident of a great man having been born at a certain place cannot possibly argue any merit in that particular spot of ground. He was, most probably, an Ionian, born in the neighbourhood of Smyrna, which country was then called Ionia, being possessed by a colony of Greeks of that denomination, and which is, indeed, one of the oldest names by which the Greeks are known in ancient history; and this accounts for his possessing so perfect a knowledge of the Ionic, a dialect of the Greek language, in which his poems are composed. His poems are of the class styled epics—that is, long narrative poems, of a certain regular structure. That called "the Iliad" contains an account of certain incidents in the Trojan war, a transaction which happened one or two hundred years before Homer's supposed age, and about the same time with the building of Solomon's temple. The Trojan war was probably a very obscure and paltry affair, for it occurred at a time when the Greeks, who carried it on, were little better than barbarians—but it has been elevated by the fancy of Homer into something very magnificent, interesting even the immortal gods in its progress and issue. Troy is represented as a great Asiatic city, of such strength as to have held out for ten years against the whole strength of the Greeks, who were provoked into besieging it, in consequence of the abduction of Helena, the wife of one of their petty princes, by Paris, a son of the king of Troy. The immediate subject of the poem is the quarrel of two chiefs of the Greeks, Agamemnon and Achilles, during the progress of the siege. In one of the encounters between the Greeks and Trojans, the former became the victors, and obtained considerable spoil, among which were several female captives, one of whom, the daughter of Chryses, the priest of Apollo, remarkable for her beauty and attractive manners, falls to the lot of Agamemnon. Chryses beseeches Agamemnon to restore his daughter, which the chief refuses to do, saying he loved her better than his wife Clytemnestra. Under these circumstances, the priest prays to his god Apollo for assistance, and a severe plague is consequently sent upon the Grecian camp. The Greek council of war consults about what is to be done to avert this sad calamity, and is informed by an augur, or diviner, that the only method to obtain relief is to restore the daughter of Chryses. Agamemnon, whose affections had been won by the young priestess, is enraged at the augur, and hesitates to comply with the demand. But upon weighing the motives in his mind, and seeing the necessity of returning the captive, he swears that he will have Briseis, another beautiful captive, who had fallen to the lot of Achilles, in her stead. Upon his making this demand, Achilles declares himself grievously insulted, considering that he had shared the same perils and hardships as Agamemnon, and was, as well as he, an independent chief of Greece. To signify still more particularly the indignation which he felt, he withdrew his forces from the camp, and implored his mother, Thetis (a fabulous divinity), to exert her influence in his behalf. Thetis applies to Jupiter, the king of the gods, for his assistance, and, shortly after, the thunders of that mighty personage fall upon the Grecian army, and the deepest misery and distress is experienced. In process of time, however, Achilles is reconciled to Agamemnon, and, by their united efforts, Troy is ultimately taken, and the object of the expedition accomplished. This is the whole subject of the twenty-four books or sections of the Iliad, though many characters and incidents are introduced, which cannot be here specified. The mixture of divine and human agency in the poem gives it, upon the whole, a childish character; yet, if the reader get over this objection, he cannot fail to be charmed by the dignity, and even sublimity, which the work exhibits throughout. There is no diffuseness nor extravagance in the imagery of the Iliad: every thing is dignified and concise, and from beginning to end one elevated strain is kept up. In the language there is often a surprising felicity, insomuch that one word will sometimes fill the mind of the reader with a delightful picture. But the great merit of the poem lies in the manly strength of thought, and the singular ardour of imagination, which it displays. No poet was ever more happy, says Dr Blair, in the choice of his subject, or more successful in painting his historical and descriptive pieces. There is a considerable resemblance in the style to that of some parts of the Bible—for instance, Isaiah—which must be accepted as a kind of testimony to the authenticity of the sacred writings, seeing that they are productions of nearly the same age, and of a part of the world not far from the alleged birth-place of Homer.

This illustrious bard composed another poem of about the same length, called the Odyssey, which looks like a production called forth by the success of a previous one, and inferior for want of the same interest in the subject. It relates the adventures of a distinguished Grecian chief, named Ulysses, on his way home from the Trojan war. Both poems have continued for much more than two thousand years to enjoy the admiration of mankind; and it is certainly surprising that no effort in the same style of poetry, though made under circumstances infinitely more advantageous than those of the blind old minstrel, has ever been in nearly the same degree successful. They are translated into almost all literary languages: in English, there are two excellent versified translations, one by Pope, and the other by Cowper, of which the former is considered the more pleasing, and the latter the more correct.

Another ancient Greek writer, of whom common readers must have heard a great deal, is Herodotus. As Homer is the first poet whose works have survived, so is Herodotus the first historian. He was born at Halicarnassus in Greece, now called Budrun, in the year 484 before Christ. In the part of Greece which gave birth to Herodotus, there was spoken a dialect called the Doric, which, like that of Scotland, as compared with English, was not considered a proper language for ordinary composition. But Herodotus, from disgust at his native government, removed in manhood to Samos, where the prevailing dialect was that elegant Ionic in which Homer had composed his poems; and he accordingly became familiar with this tongue, insomuch that his writings are said to exhibit it in a state of higher perfection than any other. Having formed a design of writing history, this ingenious man travelled for materials into Egypt and Italy, besides various parts of Asia, and in this manner acquired much valuable information respecting nations previously unknown, as well as of manners, customs, and habits, which have imparted great value to his pages. He is supposed to have profited much by intercourse with the Egyptian priests, who for many centuries before this period had been remarkable for a mysterious kind of traditionary learning. After writing his work in nine books, and polishing it with much studious care, he read parts of it to his countrymen assembled at the Olympic games, and thus obtained a larger and more immediate measure of fame than what was generally acquired by the writers of those ages, when there was no printing press to multiply copies of any literary composition. But for Herodotus, we should have now been ignorant of a large and important part of profane history. It is curious that this writer was more disbelieved in his own age than in the present. Many of the things which he told of other countries were so wonderful, that they startled his contemporaries, and were for many subsequent ages looked upon as doubtful; but not a few of these things have been ascertained by modern inquiry to be true, as Herodotus related them. This shows that scepticism or disbelief may be the mark of ignorance, as well as it sometimes is of knowledge, of which another remarkable illustration is afforded by Bruce's Travels in Abyssinia, which were scoffed at forty years ago, but have since been authenticated. At the same time, it must be mentioned that Herodotus communicates some fiction along with his facts, though apparently in no case where he was not himself deceived.

THE MARVELLOUS HISTORY OF MYNHEER VON WODENBLOCK.*

He who has been at Rotterdam will remember a house of two stories which stands in the suburbs just adjoining the basin of the canal that runs between that city and the Hague, Leyden, and other places. I say he will remember it, for it must have been pointed out to him as having been once inhabited by the most ingenious artist that Holland ever produced, to say nothing of his daughter, the prettiest maiden ever born within hearing of the croaking of a frog. It is not with the fair Blanche, unfortunately, that we have at present any thing to do; it is with the old gentleman her father. His profession was that of a surgical-instrument maker, but his fame principally rested on the admirable skill with which he constructed wooden and cork legs. So great was his reputation in this department of human science, that they whom nature or accident had curtailed, caricatured, and disappointed in so very necessary an appendage to the body, came limping to him in crowds, and, however desperate their case might be, were very soon (as the saying is) set upon their legs again. Many a cripple, who had looked upon his deformity as incurable, and whose only consolation consisted in an occasional sly hit at Providence, for having entrusted his making to a journeyman, found himself so admirably fitted, so elegantly propped up by Mynheer Turningvort, that he almost began to doubt whether a timber or cork supporter was not, on the whole, superior to a more commonplace and troublesome one of flesh and blood. And, in good truth, if you had seen how very handsome and delicate were the understandings fashioned by the skilful artificer, you would have been puzzled to settle the question yourself, the more especially if, in your real toes, you were ever tormented with gout or corns.

One morning, just as Master Turningvort was giving its final smoothness and polish to a calf and ankle, a messenger entered his *studio*, to speak classically, and requested that he would immediately accompany him to the mansion of Mynheer Von Wodenblock. It was the mansion of the richest merchant in Rotterdam, so the artist put on his best wig, and set forth with his three-cornered hat in one hand, and his silver-headed stick in the other. It so happened that Mynheer Von Wodenblock had been very laudably employed, a few days before, in turning a poor relation out of doors, but in endeavouring to hasten the odious wretch's progress down stairs by a slight impulse *a posteriore* (for Mynheer seldom stood upon ceremony with poor relations), he had unfortunately lost his balance, and tumbling headlong from the top to the bottom, he found, on recovering his senses, that he had broken his right leg, and that he had lost three teeth. He had at first some thoughts of having his poor relation tried for murder; but being naturally of a merciful disposition, he only sent him to jail on account of some unpaid debt, leaving him there to enjoy the comfortable reflection that his wife and children were starving at home. A dentist soon supplied the

* This amusing tale, the production of Mr H. G. Bell, author of the Life of Queen Mary in Constable's Miscellany, has already been often printed. It is hoped, however, that, by re-appearing in the Edinburgh Journal, it will reach many thousand readers into whose hands it has never before fallen.

invalid with three teeth, which he had pulled out of an indigent poet's head at the rate of ten stivers a-piece, but for which he prudently charged the rich merchant one hundred dollars. The doctor, upon examining his leg, and recollecting that he was at that moment rather in want of a subject, cut it carefully off, and took it away with him in his carriage to lecture upon it to his pupils. So Mynheer Wodenblock, considering that he had been hitherto accustomed to walk and not to hop, and being, perhaps, somewhat prejudiced in favour of the former mode of locomotion, sent for our friend at the canal basin, in order that he might give him directions about the representative with which he wished to be supplied for his lost member.

The artificer entered the wealthy burgher's apartment. He was reclining on a couch, with his left leg looking as respectable as ever, but with his unhappy right stump wrapped up in bandages, as if conscious and ashamed of its own littleness. "Turningvort, you have heard of my misfortune; it has thrown me into a fever, and all Rotterdam into confusion; but let that pass. You must make me a leg; and it must be the best leg, sir, you ever made in your life." Turningvort bowed. "I do not care what it costs" (Turningvort bowed yet lower), "provided it outdoes every thing you have yet made of a similar sort. I am for none of your wooden spindleshanks. Make it of cork; let it be light and elastic, and cram it as full of springs as a watch. I know nothing of the business, and cannot be more specific in my directions; but this I am determined upon, that I shall have a leg as good as the one I have lost. I know such a thing is to be had, and if I get it from you, your reward is a thousand guineas." The Dutch Prometheus declared, that to please Mynheer Von Wodenblock, he would do more than human ingenuity had ever done before, and undertook to bring him, within six days, a leg which would laugh to scorn the mere common legs possessed by common men.

This assurance was not meant as an idle boast. Turningvort was a man of speculative as well as practical science, and there was a favourite discovery which he had long been endeavouring to make, and in accomplishing which he imagined he had at last succeeded that very morning. Like all other manufacturers of terrestrial legs, he had ever found the chief difficulty in his progress towards perfection to consist in its being apparently impossible to introduce into them any thing in the shape of joints, capable of being regulated by the will, and of performing those important functions achieved under the present system, by means of the admirable mechanism of the knee and ankle. Our philosopher had spent years in endeavouring to obviate this grand inconvenience, and though he had undoubtedly made greater progress than any body else, it was not till now that he believed himself completely master of the great secret. His first attempt to carry it into execution was to be in the leg he was about to make for Mynheer Von Wodenblock.

It was on the evening of the sixth day from that to which I have already alluded, that with this magic leg, carefully packed up, the acute artizan again made his appearance before the expecting and impatient Wodenblock. There was a proud twinkle in Turningvort's grey eye, which seemed to indicate that he valued even the thousand guineas, which he intended for Blanche's marriage-portion, less than the celebrity, the glory, the immortality, of which he was at length so sure. He untied his precious bundle, and spent some hours in displaying and explaining to the delighted burgher the number of additions he had made to the internal machinery, and the purpose which each was intended to serve. The evening wore away in these discussions concerning wheels within wheels, and springs acting upon springs. When it was time to retire to rest, both were equally satisfied of the perfection of the work; and at his employer's earnest request, the artist consented to remain where he was for the night, in order that early next morning he might fit on the limb, and see how it performed its duty.

Early next morning all the necessary arrangements were completed, and Mynheer Van Wodenblock walked forth to the street in ecstacy, blessing the inventive powers of one who was able to make so excellent a hand of his leg. It seemed indeed to act to admiration. In the merchant's mode of walking, there was no stiffness, no effort, no constraint; all the joints performed their office without the aid of either bone or muscle. Nobody, not even a connoisseur in lameness, would have suspected that there was any thing uncommon, any great collection of accurately adjusted clock-work under the full well-slashed pantaloons of the substantial-looking Dutchman. Had it not been for a slight tremulous motion occasioned by the rapid whirling of about twenty small wheels in the interior, and a constant clicking, like that of a watch, though somewhat louder, he would even himself have forgotten that he was not, in all respects, as he used to be, before he lifted his right foot to bestow a parting benediction on his poor relation.

He walked along in the renovated buoyancy of his spirits till he came in sight of the Stadt House; and just at the foot of the flight of steps that lead up to the principal door, he saw his old friend, Mynheer Vanoutern, waiting to receive him. He quickened his pace, and both mutually held out their hands to each other by way of congratulation, before they were near enough to be clasped in a friendly embrace. At last the merchant reached the spot where Vanoutern stood; but what was that worthy man's astonishment to see him, though he still held out his hand, pass quickly by, without stopping, even for a moment, to say, "How d'ye do?" But this seeming want of politeness arose from no fault of our hero's. His own astonishment was a thousand times greater, when he found that he had no power whatever to determine either when, where, or how his leg was to move. So long as his own wishes happened to coincide with the manner in which the machinery seemed destined to operate, all had gone on smoothly; and he had mistaken his own tacit compliance with its independent and self-acting powers for a command over it, which he now found he did not possess. It had been his most anxious desire to stop to speak with Mynheer Vanoutern, but his leg moved on, and he found himself under the necessity of following it. Many an attempt did he make to slacken his pace, but every attempt was vain. He caught hold of the rails, walls, and houses, but his leg tugged so violently, that he was afraid of dislocating his arms, and was obliged to go on. He began to get seriously uneasy as to the consequences of this most unexpected turn which matters had taken; and his only hope was, that the amazing and unknown powers, which the complicated construction of his leg seemed to possess, would speedily exhaust themselves. Of this, however, he could as yet discover no symptoms.

He happened to be going in the direction of the Leyden canal, and when he arrived in sight of Mynheer Turningvort's house, he called loudly upon the artificer to come to his assistance. The artificer looked out from his window with a face of wonder. "Villain!" cried Wodenblock, "come out to me this instant!—You have made me a leg with a vengeance!—It won't stand still for a moment. I have been walking straight forward ever since I left my own house, and unless you stop me yourself, Heaven only knows how much farther I may walk. Don't stand gaping there, but come out and relieve me, or I shall be out of sight, and you will not be able to overtake me." The mechanician grew very pale; he was evidently not prepared for this new difficulty. He lost not a moment, however, in following the merchant, to do what he could towards extricating him from so awkward a predicament. The merchant, or rather the merchant's leg, was walking very quick, and Turningvort, being an elderly man, found it no easy matter to make up to him. He did so at last, nevertheless, and, catching him in his arms, lifted him entirely from the ground. But the stratagem (if so it may be called) did not succeed, for the innate propelling motion of the leg hurried him on along with his burden at the same rate as before. He set him therefore down again, and stooping, pressed violently on one of the springs that protruded a little behind. In an instant the unhappy Mynheer Von Wodenblock was off like an arrow, calling out in the most piteous accents—"I am lost! I am lost! I am possessed by a devil in the shape of a cork leg! Stop me! for Heaven's sake, stop me! I am breathless—I am fainting! Will nobody shatter my leg to pieces? Turningvort! Turningvort! you have murdered me!" The artist, perplexed and confounded, was hardly in a situation more to be envied. Scarcely knowing what he did, he fell upon his knees, clasped his hands, and with strained and staring eyeballs, looked after the richest merchant in Rotterdam, running with the speed of an enraged buffalo, away along the canal towards Leyden, and bellowing for help as loudly as his exhaustion would permit.

Leyden is more than twenty miles from Rotterdam, but the sun had not yet set, when the Misses Backsneider, who were sitting at their parlour window, immediately opposite the "Golden Lion," drinking tea, and nodding to their friends as they passed, saw some one coming at furious speed along the street. His face was pale as ashes, and he gasped fearfully for breath; but without turning either to the right or the left, he hurried by at the same rapid rate, and was out of sight almost before they had time to exclaim, "Good gracious! was not that Mynheer Von Wodenblock, the rich merchant of Rotterdam?"

Next day was Sunday. The inhabitants of Haarlem were all going to church, in their best attire, to say their prayers, and hear their great organ, when a being rushed across the market-place, like an animated corpse—white, blue, cold, and speechless, his eyes fixed, his lips livid, his teeth set, and his hands clenched. Every one cleared a way for it in silent horror; and there was not a person in Haarlem who did not believe it a dead body endowed with the power of motion.

On it went through village and town, towards the great wilds and forests of Germany. Weeks, months, years, passed on, but at intervals the horrible shape was seen, and still continues to be seen, in various parts of the north of Europe. The clothes, however, which he who was once Mynheer Von Wodenblock used to wear, have all mouldered away; the flesh, too, has fallen from his bones, and he is now a skeleton—a skeleton in all but the cork leg, which still, in its original rotundity and size, continues attached to the spectral form, a *perpetuum mobile*, dragging the wearied bones for ever and for ever over the earth!

May all good saints protect us from broken legs! and may there never again appear a mechanician like Turningvort, to supply us with cork substitutes of so awful and mysterious a power!

LADY ISABEL,

A LEGEND.

THE Lady Isabel was a Scottish Baron's daughter, and far was she famed. Were others fair, she was fairer; were others rich, she was richer. In short, all perfections were said to be centred in the Lady Isabel, and yet that quality for which she ought to have been most prized seemed the one which made the least noise in the world; and this was her devoted duty to her father. She was his only child—the child of his old age, the idol of his heart, and the lamp of his life. But still was he a cruel father; for in return for her duteous affection he had determined to wed her to a man she had never seen, while he knew that her heart was another's.

The Lord of Ormisdale was the son of his ancient friend, and the possessor of broad lands in a distant part of Scotland. The two old men had sworn to each other that their children should be united, but ere this paction, the youth had been sent abroad to be initiated in the art of war—an art but too much practised in his native country at that time; for be it known, that our peerless beauty bloomed in the 15th century, when the feuds of the Scottish nobility were frequent and deadly. Much was bruited abroad of the goodly person and brave qualities of the young Earl, but of this Lady Isabel had no opportunity of judging, for never, as has been told, had she seen him. She had, however, but too often seen his cousin Roderick, and to him was her heart devoted. It was true he had neither title, landau, nor vassals; but he was a handsome, a noble, and a gallant youth, and he had knelt at her feet, and confessed his love, and swore eternal constancy: and though, when she thought of her father, she turned coldly away, it was but to treasure his image in her heart, and to weep most bitter tears for the hapless fate which doomed her to wed another. Roderick, by and bye, went away to a foreign land, distraught by his passion for the Lady Isabel; and the time was long, and he returned not, and none spoke of him, or seemed to think of him, save his disconsolate love. But it was not so; for the old Baron loved him for his worth and manly bearing; and when he saw his daughter drooping her head like a lily, he too was unhappy, and repented him of his rash vow, though he would rather have sacrificed his own life, and hers too, than have broken his oath. And so time passed on, and many were the suitors that sought the hand of the Lady Isabel. Some loved her for herself, some for her great possessions, and some for both; but all were sent hopeless away.

And now the time was at hand when the sun was to shine upon the nineteenth birthday of the Baron's daughter, and multitudes were invited to his castle to celebrate the festival with mirth and revelry. Many were the reasons on which he had thrown wide his castle gates and welcomed numerous guests, and ample the hospitable provision he had made for them; but never, during his life, or that of his forefathers, had there been such doings as now. Whole hecatombs of sheep and oxen bled on the occasion, with wain-loads of deer, wild and tame fowl, and other creatures. Every country seemed to have been taxed for fruit and other delicacies, while beer of the strongest, and wines of the richest, seemed, by the quantities provided, to be intended absolutely to flow in rivers. The birthday of the Lady Isabel had been celebrated, as it came round, ever since that on which she first drew her breath, but never had there been even imagined such preparations as this. The tongues of all the gossiping old dowagers in the kingdom were set a-going on the occasion: some assigned one reason for this extraordinary entertainment, and some another. Now, there were several whose eager curiosity caused them so much uneasiness, that they went so far as to ask an explanation of the old Baron himself. They were all, however, foiled in the attempt to penetrate the mystery, and therefore settled in their own minds that the old man had either lost his wits altogether, or was in his dotage.

Nor, to speak the truth, did the young lady, on whose account was all this turmoil, feel less surprised than other people at her father's unbounded extravagance, especially as there arrived from the capital chest after chest, packed with the richest vestments, cut in the most approved fashion of the day, and boxes filled with jewellery, which, added to the family gems she already possessed, might have furnished the dowry of a princess.

The day at length arrived for which all this extraordinary preparation had been made; and the Baron,

not content with charging his daughter to apparel herself in a suit which, by its exceeding splendour, seemed to have been particularly intended for the occasion, and to wear her most costly jewels, also commanded her maidens to tax their wits in ornamenting and setting off, to the best advantage, the charms of their young mistress.

And now, after having arranged all things, and being promised implicit obedience by his daughter, the mystery of all his magnificent proceedings was partly unravelled by his telling her that they were that night to expect the arrival of the Earl of Ormisdale. He moreover presented her with a mask, and informed her that he had taken order that each of his guests should put on a visor before they entered the ball-room, after they left the banqueting-hall, and that he had done this for her sake, that the eye of idle curiosity should not read in her features what was passing in her mind when she first met her betrothed. It was in vain that the afflicted Lady Isabel pled most movingly for a more private meeting, for her father was deaf to her entreaties, while he affirmed that his precaution of the visor would do away all objections, and was so peremptory in the matter, that, as usual, she acquiesced; and having thanked and kissed his dutiful daughter, he withdrew from her with renewed youth in his step, and joy in his eye. How different, however, were the feelings of his daughter on this momentous subject! and sore averse was she to meet the man she was sure that she could never love; and many were the tears she shed, and many the resolves she made to retract all her promises, and live and die in solitude. But then she bethought her of the despair of her poor old father—of his tender, though mistaken, love—of the few remaining years of his life embittered by disappointment—and his death probably hurried on through her means. All this was too much when laid in the balance with only her own happiness, and she still sustained the character of a dutiful daughter, by heroically determining to sacrifice all selfishness at the altar of filial duty and affection.

But though this was her ultimate resolve, we need not be surprised, that, when decked in her splendid attire, and presiding in the gorgeous banqueting-hall of her father, she looked and felt as if assisting at a funeral feast, and that she even then would have been the better of the visor to prevent many conjectures on what her saddened looks might mean. But the time for assuming the mask arrived, and the nobles of the land, with their haughty dames, and many a knight, and many a damsel fair, bedight in silk and cloth of gold, and blazing with jewels, graced the tapestried ball-room, on which a flood of brilliant light was poured from lamp and torch. And each in joyous mood, cheered by the merry minstrels, and by the sound of harp and viol, impatiently awaited the commencement of the dance, when they were informed that it was stayed for an expected and honourable guest. And now again curiosity was at its height. But presently there was a flourish of the music, and a cry of the ushers to make way for the noble Earl of Ormisdale, and the large doors at the foot of the hall were flung wide open, and the gallant young Earl, masked, and attended by a train of young gentlemen, all his kinsmen, or picked and chosen friends, advanced amid murmurs of admiration to the middle of the hall. Here they were met and welcomed by the Baron, who led the Earl to his lovely daughter, and having presented him to her, the guests were presently gratified by seeing the gallant young nobleman take the hand of the Lady Isabel, and lead her out to dance. Nor were there any present whose eyes did not follow them with admiration, though the measure chosen by the high-born damsel savoured more that night of grace and dignity, than lightness of either heart or heel. Meantime, the old Baron was so full of joy and delight, that it was remarked by all, as he was still seen near his daughter and her partner. But their hearts were both quaking—the unhappy Lady Isabel's with thinking of her promise to her father, and that of her betrothed with a fear known only to himself, for he had heard that she had loved, and now observed her narrowly. And, not content with this, he asked her, as he sat beside her, many a wily question, till at last he spoke his fears in plain guise, and she, with many sighs and tears shed within her mask, confessed the truth; still saying, that for her father's sake she would be his wife, if he accepted of her on such terms. But now her father told her in her ear, that she must presently prepare to keep her word, as this must be her bridal-night, for to that purpose alone was this high wassel kept. Her lover, too, no way daunted by his knowledge of her heart, pressed on his suit to have it so. And now was the despairing damsel almost beside herself, when her father, announcing aloud his purpose to the astonished guests, called for the priest, and caused all to unmask. But in what words shall we paint the surprise, the delight, the flood of joy that came upon the heart of the Lady Isabel, when the Earl's mask was removed, and she beheld in him her much loved Roderick, who, his cousin being dead, was now the Earl of Ormisdale!

And now was each corner of the castle, from basement stone to turret height, filled with joyous greetings, and the health and happiness of the noble Earl Roderick, and of his bride, the dutiful Lady Isabel, deeply drank in many a wassel bowl.

The stately castle and its revels, the proud Baron and his pomp, the beauteous bride and her children's children, have now all passed away into oblivion, save this slight record, which has only been preserved in remembrance of the daughter's virtue, who preferred her father's happiness to her own.

THE ENGLISH AND THE SCOTCH.

No nation can judge exactly of its own character. It requires another nation to do so, as it is necessary, in order to see a house thoroughly, to go forth a little way from the door. Whether the Scotsman is a properly qualified person to judge of the Englishman, may perhaps be doubted, as he is hardly foreign enough. Yet, as he is still in some measure a person of different manners and habits of thought, there may be some truth in his observations—or at least it may be curious for the English people to know exactly what is the commonly received impression in Scotland respecting them.

What always strikes the Scotch most forcibly respecting the English, is the comparatively great attention which the latter pay to personal comforts, and particularly to the comfort of the inner man. "The English pockpuddings" is a ridiculous phrase of obloquy which the Scotch used to apply to them in the days of barbarism and national hostility in reference to this peculiarity of character; and, even yet, nine out of ten Scotchmen entertain the notion that their southern neighbours are over much devoted to good living. To speak with perfect candour, we never yet knew a Scotchman who did not live as well as he could, and, if provided with the means, indulged his appetites just as much as we believe the English are inclined to do. Yet that the nation in general do live in a more sparing manner, is a fact, we conceive, as undeniable as that they live on a different side of the Tweed. The whole matter seems to be one of circumstances. The English have for centuries cultivated a country which freely yielded the best and amplest fruits: the Scotch, on the other hand, have struggled as long with a soil which, never till lately, produced more than a very stinted harvest. The English have never till perhaps a very late period known want: the Scotch have never, till a period equally late, known what *enough* was. The one nation has been brought up (so to speak) in the enjoyment of what we seriously believe to be no more than a competency—but still a *competency*; the other has been reared in penury, or at least the most careful economy; and, having got into a habit of spare living, is disposed, perhaps, to look upon even a simple sufficiency as a kind of extravagance.

Thus the Scotch, without any disposition to find fault with their neighbours—for there is now happily no ill feeling between these kindred nations—often express wonder at the enjoyments of the English. That a farm-labourer or waggoner in England should have regular rations of bacon—that artizans should generally have roast meat on Sundays—produces astonishment in all classes of Scotchmen, who know very well that the same orders in their own country very rarely taste animal food or wheaten bread, and yet, notwithstanding all that Mr Cobbett may say to the contrary, are content. Some years ago, when an English regiment lay in a small town in the south of Scotland, a private soldier, who was servant to an officer, was observed with surprise, when breakfasting in his own lodging with his wife, not only to have his bread toasted, which, in this self-denying country, is itself looked upon as a kind of luxury, but to have it buttered on both sides, and to eat it with a knife and fork. Simple as this incident was, it would be difficult to describe adequately the impression which it made upon the people who observed, or were informed of it. It was considered as an almost impious use of the bounties of Providence. More recently, a Scotchman, travelling in England, observed a ewe which had been slightly injured by accident, and while natural death might have been easily anticipated by the knife (if even its natural death, occurring under such circumstances, had been deemed to unfit it for human food), given by the drivers to the hogs, as proper only for them; an act which the Caledonian observer considered as nothing else, to use one of the favourite expressions of his country, than *downright wastry*, seeing that, in Scotland, the animal would have become food for human beings, even although the case had been one of a far more desperate nature. Such observations as these have given, to the Scottish people generally, an impression that the English are too nice about their food—make it too much a matter of deliberate consideration—and value it more for the gratification it gives to a very humble appetite or taste, than for the conviction which it should give of the goodness of the Deity towards his creatures. From the rigour of their early circumstances, the Scotch have a high reverence for food. They feel at once a moral and religious pain on seeing it abused or wasted, and even, we may almost say, when they observe it delighted in for the sake of its relish on the palate. They have been accustomed to such difficulty in getting the bare sufficiency for sustenance, that they can hardly yet allow their feelings, in eating, to go beyond a mere gratitude for it in that point of view. If it chance to have the reverse of a relish—if, for instance, the bishop has put his foot in it—they totally forget their inherent antipathy to episcopacy, and, under a feeling that food is in no circumstances to be despised, force themselves to think and speak of it as "very good," and rebuke every wry face amongst the youngsters at table as in some measure a religious offence. Though these remarks apply more expressly to the humbler and less Anglicised part of the community, they also characterise in a greater or less degree almost all the people of Scotland, and we would suppose that they will hardly be perused by the English without elevating the former people in the estimation of the latter, testifying, as they do, that the Scotch have made a good and pious use of their less fortunate position on the globe, and that national poverty, so far from being a proper subject for ridicule, may produce virtues of the most respectable character.

Since the gains of the Scotch labourers and operatives are now fully up to the English standard, it may be asked, what do the former do in general with the superfluous money, if they have not yet acquired the same taste for food? The question may be thus answered—They partly spend it on clothes, and partly on intoxicating liquors; two modes of expenditure, which, however different in moral propriety, are equally characteristic, we fear, of the people. The Scotch, be it remarked, taking rank against rank, give greater play to their minds, and are far more addicted to abstract speculation, than the English. Hence, if they are well-disposed, they adorn the exterior of their persons with their spare money, in order that they may have an appearance superior to their actual station, or at least make their station look as respectable as possible; an indulgence certainly mental, and which supports and cherishes the national habits of economy in the department of eating and drinking. If ill-disposed, or liable to vicious example, they fall into habits of drinking, which still is more a mental than a bodily indulgence, though calculated in its every degree to injure, and in its last excess to destroy, both mind and body. The habit of drinking has unfortunately gone to a lamentable height among our working people; but yet it bears no proportion to the laudable desire which prevails in the same class to dress themselves respectably in their periods of relaxation. This was testified in a most remarkable manner in August 1832, when about ten thousand working people (and there could hardly be any more in the city) appeared in a procession at Edinburgh, all of them attired in good, and many of them in superfine clothes, and the whole preserving a decorum in the highest degree praiseworthy: a spectacle which, it is not too much to say, hardly any other city in the empire could have exhibited. Such are the blessed effects of the law, now nearly three centuries old, which renders every adult native of the country able to read and write.

Taken in contrast with Scotland, the English do not only seem to live better, as it is called, as individuals, but the nation have a generous and anti-economical system in various other things, which excites similar astonishment among their northern neighbours. They seem to take a pride, for instance, in having large and well-fed horses, and a greater number of them in every plough and waggon, than what the practice of other countries shows to be at all necessary. We have seen eleven huge horses in one English waggon, the contents of which, we are satisfied, could have been carried in five Scottish one-horse carts, smaller as the horses are in Scotland. There is, in fact, in this branch of rural economy in England, a wanton prodigality of food and horse-power, which nothing but inveterate and unreflecting custom could so long keep up against mathematical reason and plain sense. It seems as if the Scotch, men and horses, could live well among the very feet of the English; and we verily believe, that, if a miracle could at once convert the customs and the people of England into an exact resemblance to those of Scotland, so much would be saved as would go a great way to pay the taxes of the country, both for church and state, grievous as these are allowed to be.

If we might, without exciting invidious feelings, pursue any further this detail of the impressions of the Scotch respecting the English, we would mention, with all respect to the latter people, that their brethren on this side of the Tweed never fail to remark, as something singular, the exclusive devotion of every Englishman to his own line of life, and the little interest which he seems to take in all knowledge not exactly necessary to his profession, or to his personal comfort. The English appear to the Scotch as a people who make it too exclusively their object "to get on in the world," and who, in their blind pursuit of mere business, forget some of the other ends of man's creation. The truth is, business has arrived at such a high pitch of perfection in England, that it engrosses more attention than is perhaps reasonably due to it, and each man has got so thoroughly hacked in his own subdivision of it, that he runs the risk of losing sight of every thing else. Now, in Scotland, business is only here and there upon a first-rate scale. The most of the people, instead of taking minute subdivisions, have to slump several large departments, in order to make a livelihood. This, with the naturally speculative disposition of the race, enables almost all of them to keep a great deal of their minds awake to general ideas; and he would, in Scotland, be considered a very poor Scotsman indeed, who had not a smattering of almost every kind of knowledge. In England, the vulgar wealth of lucky and idealess men

is so common, as to be a standing subject of ridicule in plays and novels. But in Scotland there is little of this to be seen. A stranger is far more likely to be struck by the encyclopedic information and good manners of men who seem to follow but a humble line of business, and are not at all "getting on in the world." This is plainly the cause of so many Scotsmen getting into the best situations connected with the English press. The Scotch do not nearly so often as the English fall, early and little instructed, into the same line of life with their fathers. They linger long, and look well about them, and few but what endeavour to mount at least one step higher. Thus so many of them, in early life, are loose and disengaged, that, considering the excellent school education they generally get, it is not to be wondered at that they become adventurers in foreign lands, and drop into all the irregular and unclassified employments (such as the press), which the English never would think of breeding their children to.

Again, there is a similar difference between the *wives* of England and Scotland. In consequence, apparently, of the importance attached by men to domestic comforts in the former country, their spouses are under the necessity of paying an almost unremitting attention to the concerns of their households. Few married women in England, of the middle rank, go much abroad: we have observed numerous specimens, who hardly ever went out from one end of the week to the other, except, perhaps, to church, seeming to consider it necessary that they should superintend, if not actually assist in, every minute transaction of their maids—as if they had been afraid that either their children, or their servants, or their chairs and tables, or the house itself, would have been in danger of running away, during even the most momentary absence. In fact, the English married woman of the middle rank, appears, to a Scottish observer, as far too much of a housekeeper—she appears to be the very slave of domestic necessities. How far this may be advantageous in one respect, or disadvantageous in another, is a different matter: we presume not to judge, but only wish to show the contrast between the two nations. In Scotland, the married women are not nearly to such an extent absorbed in household duties. They devote, in general, such a degree of time and attention to these matters, as appears to their husbands sufficient for domestic happiness—at least we never hear any complaint against them, as a class, on the score of negligence. The thorough-paced scourer and cleaner, who, in the words of Esop, "rises at five to scold the maids," is a rare character in Scotland, and generally excites remark on that account among her friends. She is looked upon as an unhappy being her neighbours pity her for her insatiable rage after slopery and white-washing, and wonder how any rational person can every day endure perhaps eleven hours of confusion and nastiness, that she may sit for the twelfth in a scene a *little* better arranged, or a *little* cleaner than usual. The Scottish married ladies, in general, like their husbands, keep a part of their minds and of their time salient for general purposes—certainly a much greater portion than the English wives in general—and are not only able, perhaps, when their husbands come home to dinner, to inform him as to the condition of his children, and satisfy his hunger with a well-prepared meal, but can converse with him, as it may happen, of some of the great movements of the world out of doors, or of the contents of some valuable new publication which she has been reading. It will thus be observed, that the female part of the two nations partake of the character of the male part, or are correspondently useful and agreeable in regard thereto; and perhaps, after all, each system is alike meritorious and beautiful in its way, for if the one be agreeable to the ideas of the English people, and the other to the Scotch, it is obvious that the great ends of Providence are in both cases fulfilled.

Such are a few of the observations which the Scotch generally make upon the English: they are reported here in the most candid and philanthropic spirit, by a Scotsman who loves truth a great deal better than Scotland, and, if mistaken in any material point, we hope they will be so far excused. If any good can be derived from thus seeing themselves mirrored in the mind of another nation, we leave it to the sagacity of the English themselves to apply it.

ANCIENT ECONOMY.

My father was a yeoman, and had no lands of his own; only he had a farm of three or four pounds by year at the uttermost, and hereupon he tilled as much as kept half a dozen men. He had walks for an hundred sheep, and my mother milked thirty kine. He was able, and did find the king a harness, with himself and his horse, while he came to the place that he should receive the king's wages. I can remember that I buckled his harness when we went to Blackheath field. He kept me to school, or else I had not been able to have preached before the king's majesty now. He married my sisters with five pounds, or twenty nobles a-piece; so that he brought them up in godliness and fear of God. He kept hospitality for his poor neighbours, and some alms he gave to the poor, and all this he did off the said farm; where he that now hath it payeth sixteen pound by the year, or more, and he is not able to do any thing for his prince, for himself, nor for his children, or give a cup of drink to the poor.—*Bishop Latimer's Sermons.*

BIOGRAPHIC SKETCHES.

MUNGO PARK.

This celebrated man, whose enthusiastic ardour, important achievements, and unhappy fate in the cause of discovery, have invested his name with a deathless fame, and redounded with so much honour to the country that gave him birth, was the son of a respectable farmer at Fowlshiels, in the county of Selkirk, on the property of the Duke of Buccleuch, and was born at his father's house on the 10th September 1771. He was the seventh of a family of thirteen children; yet, notwithstanding that his father was by no means in easy or independent circumstances, he, with the rest, enjoyed the benefit of an excellent education, by means of a private tutor engaged to reside in the family. Mungo was afterwards sent to the grammar school of Selkirk, where he made astonishing progress, not so much by his ready talents, as by his remarkable perseverance and application; and, despite of many disadvantages, uniformly kept the place of *dux*, or head of his class. This early devotion to study and aptitude of acquirement, together with his thoughtful and reserved disposition, seemed to his father to point out the church as his future profession, but upon his son's expressing a decided preference for that of medicine, he at once agreed, and bound him apprentice for three years to Mr Thomas Anderson, surgeon in Selkirk. At the expiry of his indenture in 1789, being then eighteen years of age, he went to Edinburgh, and attended the classes for three successive sessions, continuing to exhibit the same thirst of knowledge, and unwearied application to all the studies connected with his profession, particularly botany. In the latter, he is said to have been greatly assisted and encouraged by a brother-in-law, Mr James Dickson, who, from an origin even more humble and obscure than that of Park himself, subsequently raised himself to fame and fortune, and became celebrated as one of the first botanists in the kingdom. He had gone to London in search of employment as a journeyman gardener, and procured an engagement, in that humble capacity, with a nurseryman at Hammersmith, where he had the good fortune to attract the notice of Sir Joseph Banks, through whose kind friendship and patronage he was mainly indebted for his future success and celebrity.

After qualifying himself in his profession at Edinburgh, young Park went to London in search of employment, and was very speedily appointed assistant-surgeon on board the Worcester, East Indiaman, through the interest of Sir Joseph Banks, to whom Mr Dickson had introduced him. Mr Park showed himself every way worthy of this appointment, and made an adequate return to his distinguished patron, by the valuable observations and discoveries he made in botany, and other branches of natural history, in a voyage to Bencoolen, in the island of Sumatra. On his return in 1794, being then only twenty-three years old, he had the honour of reading a paper before the Linnæan Society in London, giving a description of eight new species of fishes he had observed in Sumatra, which was afterwards published in the Transactions of the Society.

After leaving the Worcester, Mr Park appears to have had no certain or fixed views as to his future career, but his talents and genius had already distinguished him too much to allow him to remain long unemployed. The wealthy and scientific Association for the Promotion of Discovery through the Interior of Africa, were at that time preparing to send out an expedition, with the view of endeavouring to trace the course of the Niger, and procuring every information relative to the great central city of Tombuctoo, of which little more than the name was then known. Sir Joseph Banks, one of the leading men of the Association, immediately pointed out Park as one peculiarly eligible for taking the management of the expedition, and the offer being accordingly made to him, was eagerly accepted. He immediately prepared himself, therefore, for the task, being liberally supplied, according to his own statement, with the means of furnishing himself with every thing he reckoned necessary, and sailed from Portsmouth on the 22d of May 1795, in the brig Endeavour. His instructions were, to proceed to the Niger by the nearest and most convenient route, and endeavour to trace its course, from its rise to its termination; as also to visit, if possible, all the principal towns and cities on its banks, particularly Tombuctoo and Houssa, and afterwards return to Europe by the river Gambia, or any other way he thought most advisable. He arrived at Jillifica, in the kingdom of Barra, and lying on the northern bank of the Gambia, on the 21st of June; and after proceeding up the river as far as Jonkakonda, he quitted the Endeavour, and proceeded by land to a small British factory, which had been established at Pisania, in the king of Yam's territories, where he took up his residence for a short time with Dr Laidley. He immediately applied himself to the study of the Mandingo tongue, and to collect all the information possible, relative to the various people and countries in the interior, preparatory to his journey. In consequence, however, of exposure to the night dew, while observing an eclipse of the moon, in the month of July, he was seized with fever, attended with delirium, which brought him almost to the grave; nor was he sufficiently recovered to commence his journey till December. On the 2d of that month he set out, having for his escort a negro servant, named Johnson, who had resided many years in Great Britain, and understood both the English and Mandingo languages, as a guide and interpreter; a negro boy belonging to Dr Laidley, and whom that gentleman promised to set free on his return, in the event of his good conduct; with four others, not immediately under his control, but who were made to understand that their own safety depended upon their fidelity to him. It may be interesting also to notice the nature and value of his equipments for a journey of such length, peril, and importance. These consisted of a horse for himself, two asses for his servants, provisions for two days, a small assortment of beads, amber, and tobacco, a few changes of linen and other apparel, an umbrella, a pocket sextant, a magnetic compass, a thermometer, two fowling-pieces, two pairs of pistols, and a few other trifling articles. Such were all the means of sustenance, comfort, and safety, with which this intrepid man was provided for an expedition, the duration of which it was out of his power to calculate, but whose route, he well knew, lay, in some places, through pathless deserts, where neither tree grew, nor water ran, and beset with beasts of prey—in others, through the territories of barbarous tribes, from whose inhospitality or savage dispositions he had scarcely less to fear.

At the very outset, an event occurred which seemed to bode ill for the result of his journey. Dr Laidley, and a few other of the Europeans at Pisania, having escorted him during the first two days, bade him adieu, convinced that they would never see him more; and scarcely were they out of sight, when he was surrounded by a horde of native banditti, from whom he only got free by surrendering the greater part of his small store of tobacco. Park, however, was not a man to be depressed by evil auguries, and he accordingly pushed on to Medina, the capital of Woolli, where the king, a benevolent old man, received him with much kindness, and furnished him with a trusty guide to the frontiers of his dominions. Our traveller then engaged three elephant hunters, as guides and water-bearers, through the sandy desert which lay before him, where water was frequently not to be found for several days together. He performed the journey in safety, but after much fatigue, and reached Fatteconda, the residence of the king of Bondon, situated upon the very frontiers of his dominions, adjoining the kingdom of Kajaaga. It was at Fatteconda, and at the hands of the same chief, that Park's predecessor in enterprise, Major Houghton, had received such ill usage, and was plundered of almost every thing he possessed; but the only article he exacted from Park, and that not by force, but by such warm and animated expressions of admiration as left our traveller no alternative to choose, was his new blue coat, with gilt buttons, in return for which he presented him with five drachms of gold. From Fatteconda he proceeded to Joag, the frontier town of Kajaaga, travelling in the night-time for fear of robbers, and through thickets abounding with wolves and hyenas, which glided across their silent path in the clear moonshine, and hung round the small party with yells and howlings, as if watching an opportunity to spring upon them. At Joag, and whilst preparing to proceed on his journey, he was honoured by a visit from the king's son, who plundered him of the half of his little stores, on pretence of his having forfeited all his property by entering the kingdom without leave. As a sort of consolation for this disaster, and whilst appeasing his hunger with a few ground nuts which a poor negro slave had given him in charity, he was waited upon by the nephew of the king of Kasson, who had been at Kajaaga on an embassy, and who, taking pity on him, offered to escort him to his uncle's capital, to which he was now returning, and which lay in the line of our traveller's route. After crossing the river Senegal, however, which was the boundary of Kasson, his royal guide left him, having first taken from him the half of the little property he had left. A few days after this, Park, for the first time, had an opportunity of observing the manners of the barbarous and untutored natives of Africa in all their primitive simplicity and unchecked ardour. They came to a village which was the birth-place of one of his faithful escort, a blacksmith, that had accompanied him from Pisania, and who was now about to leave him, having amassed a considerable deal of money in his profession on the coast, and resolving to spend the rest of his days in ease and independence amongst his family and friends. The meeting which ensued was characterised by the most extravagant demonstrations of joy and triumph, and Park was convinced, that "whatever difference there is between the negro and European, in the conformation of the nose, and the colour of the skin, there is none in the genuine sympathies and characteristic feelings of our common nature." With these warm-hearted villagers, our traveller rested for a day or two, and then proceeded to Koo-

niakary, where the king, a fine old man, who was greatly beloved by his subjects, received him with much kindness. From this point new perils beset Mr Park's further progress, in consequence of war breaking out between the people of Bambarra, to which kingdom his course was directed, and other tribes, through whose territories he had to pass on his way thither. He nevertheless persevered, although even his faithful negro Johnson, who was aware of the dangers he was running into, refused to accompany him farther. They parted accordingly at Jarra, in the kingdom of Ludimar (the people of which, as well as of the neighbouring nations, were found to be Mahomedans), and Mr Park, having entrusted Johnson with a copy of his journal to carry back with him to Pisania, set out for the camp of Ali at Benowm, accompanied only by Dr Laidley's slave-boy, and a messenger who had arrived from Ali to conduct him thither. On the way he suffered great privations, and was repeatedly beaten and robbed by the fanatical Moors, to whom he was an object of peculiar detestation as a Christian. All the sufferings and insults which he had yet undergone, however, were nothing to what he was doomed to endure while in the power of the tyrant Ali. His appearance at Benowm excited the greatest astonishment and consternation amongst the inhabitants, scarcely one of whom had ever seen a white man before. When taken before Ali, the latter was engaged in the dignified occupation of clipping his beard with a pair of scissors, and paid little regard to him; but the ladies of the court fully maintained the character of their sex for inquisitiveness, searched his pockets, opened his waistcoat to examine his white skin, and even counted his toes and fingers to make sure of his being human. It would occupy far more space than the whole limits of this sheet, to detail the innumerable and unremitting sufferings of our unfortunate countryman during his detention at this place. The unfeeling tyrant would neither permit him to depart, nor grant him any protection from the persecution of the fanatical rabble. He was beat, reviled, compelled to perform the meanest offices, frequently on the point of starvation, and was often necessitated to sleep in the open air. All his baggage was taken from him to deter him from running away, with the exception of a pocket compass, which was supposed to be the work of magic, from the needle always pointing in the same direction, and was therefore returned to him. At last it began to be debated how he was to be disposed of—some advising that he should be put to death, others, that his right hand should be cut off, and another party, that his eyes should be put out. Park's health at length gave way under the accumulated horrors of his situation, and he was seized with a fever and delirium, which brought him to the brink of the grave. Yet even in this extremity, his persecutors never desisted from their cruelties, and tormented him like some obnoxious animal, for their amusement. Perhaps the strongest proof that can be given of the extent of his sufferings at this time, and of the deep and lasting impression they made on his mind, is the fact, that years afterwards, subsequent to his return to Scotland, and while residing with his family on the peaceful banks of the Tweed, he frequently started up in horror from his sleep, imagining himself still in the camp of Ali at Benowm. But perhaps nothing gave our traveller so much permanent grief as the fate of his faithful slave-boy Demba, whom Ali impressed into his service as a soldier, and who had conceived a great affection for Mr Park, who describes their parting as very affecting. After a month's residence at Benowm, Ali removed to Jarra, back to which place, of course, Mr Park was obliged to accompany him. Here all was alarm and terror, from the approach and apprehended attack of the king of Kaarta; and amid the bustle and confusion of the inhabitants flying from their homes, the preparations for war, &c., Mr Park at last, after great difficulty, and amid many perils, found an opportunity of escaping, and struck into the woods back towards Bambarra. Being under the necessity of avoiding all intercourse with the natives, in order to avoid being re-captured by the emissaries of Ali, who were in pursuit of him, he was at one time nearly famished in the wilderness, and we will take his own account of his sensations at this awful crisis. Thirst, intense and burning thirst, was the first and direst of his sufferings; his mouth and throat became parched and inflamed, and a sudden dimness frequently came over his eyes, accompanied with symptoms of fainting. The leaves of the few shrubs that grew around were all too bitter for chewing. After climbing up a tree in the hopes of discovering some signs of a human habitation, but without success, he again descended in despair. "As I was now," says he, "too faint to attempt walking, and my horse too fatigued to carry me, I thought it but an act of humanity, and perhaps the last I should ever have it in my power to perform, to take off his bridle, and let him shift for himself; in doing which, I was affected with sickness and giddiness, and, falling upon the sand, felt as if the hour of death was fast approaching. Here then (thought I), after a short but ineffectual struggle, terminate all my hopes of being useful in my day and generation; here must the short span of my life come to an end. I cast, as I believed, a last look on the surrounding scene; and whilst I reflected on the awful change that was about to take place, this world and its enjoyments seemed to vanish from my recollection. Nature, however, at length resumed her functions; and, on recovering my senses, I found myself stretched upon the sand, with the bridle still in my hand, and the sun just sinking behind the trees. I now summoned all my resolution, and determined to make another effort to prolong my existence; and as the evening was somewhat cool, I resolved to travel as far as my limbs would carry me, in hopes of reaching (my only resource) a watering place. With this view, I put the bridle upon my horse, and, driving him before me, went slowly along for about an hour, when I perceived some lightning from the north-east; a most delightful sight, for it promised rain. The darkness and lightning increased very rapidly, and, in less than an hour, I heard the wind roaring behind the bushes. I had already opened my mouth to receive the refreshing drops which I expected, but I was instantly covered with a cloud of sand, driven with such force by the wind, as to give a very disagreeable sensation to my face and arms; and I was obliged to mount my horse, and stop under a bush, to avoid being suffocated. The sand continued to fly for nearly an hour in amazing quantities, after which I again set forwards, and travelled with difficulty until ten o'clock. At this time, I was agreeably surprised by some very vivid flashes of lightning, followed by a few heavy drops of rain. I alighted, and spread out all my clean clothes to collect the rain, which at length I saw would certainly fall. For more than an hour it rained plentifully, and I quenched my thirst by wringing and sucking my clothes." Park at length entered the kingdom of Bambarra, where he found the people hospitable, and was astonished at the opulence and extent of cultivation he every where found. "The country, he says, was beautiful, intersected on all sides by rivulets, which, after a rain-storm, were swelled into rapid streams. He was, however, such an object of amusement and ridicule to the inhabitants, from his own tattered condition, together with the appearance of his horse, which was a perfect skeleton, and which he drove before him, that the very slaves, he says, were ashamed to be seen in his company. Notwithstanding all this, however, he held on his way, and at last, on the 21st of July (1796), had the inexpressible gratification of coming in sight of Sego, the capital of Bambarra, situated on the Niger, which the natives denominated *Joliba*, or the "Great Water." "As we approached the town," says Park, "I was fortunate enough to overtake the fugitive Kaartans, and we rode together through some marshy ground, where, as I anxiously looked around for the river, one of them called out *Geo affilli* (see the water). Looking forwards, I saw, with infinite pleasure, the great object of my mission—the long sought for majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly *to the eastward*. I hastened to the brink, and having drunk of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavours with success." Sego consisted of four distinct towns, two on the northern, and two on the southern bank of the Niger; "and the view of this extensive capital," says our traveller, "the numerous canoes on the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence which I little expected to find in the bosom of Africa." The king, Mansong, however, refused to see Mr Park, for fear of exciting the envy and jealousy of the Moorish inhabitants, and ordered him to remove to a village in the vicinity. He had no alternative but to comply; and it was here that one of those fine traits of female compassion, and of the kind interposition of Providence in his favour when at the last extremity, which he has frequently borne testimony to with thankfulness and gratitude, occurred; and this truly affecting incident we cannot avoid giving in his own simple language. On arriving at the village, he was inhospitably driven from every door, with marks of fear and astonishment. He passed the day without victuals, and was preparing to spend the night under a tree, exposed to the rain and the fury of the wild beasts, which there greatly abounded, "when a woman, returning from the labours of the field, stopped to observe me, and perceiving me weary and dejected, inquired into my situation, which I briefly explained to her; whereupon, with looks of great compassion, she took up my saddle and bridle, and told me to follow her. Having conducted me into her hut, she lighted up a lamp, spread a mat upon the floor, and told me I might remain there for the night. Finding that I was very hungry, she said she would procure me something to eat; she accordingly went out, and returned in a short time with a very fine fish, which having caused to be broiled upon some embers, she gave me for supper. The rites of hospitality being thus performed towards a stranger in distress, my worthy benefactress (pointing to the mat, and telling me I might sleep there without apprehension), called to the female part of her family, who had stood gazing on me all the while in fixed astonishment, to resume their task of spinning cotton, in which they continued to employ themselves great part of the night. They lightened their labour with songs, one of which was composed extempore, for I was myself the subject of it: it was sung by one of the young women, the rest joining in a chorus. The air was sweet and plaintive, and the words, literally translated, were these: 'The winds roared, and the rains fell. The poor white man, faint and weary, came and sat under our tree—he has no mother to bring him milk, no wife to grind his corn.' Chorus —'Let us pity the white man; no mother has he!' &c. &c. Trifling as this recital may appear to the reader, to a person in my situation the circumstance was affecting in the highest degree. I was so oppressed by such unexpected kindness, that sleep fled before my eyes. In the morning, I presented my compassionate landlady with two of the four brass buttons that remained on my waistcoat, the only recompense I could make her." Mansong, the king, having ordered Park to leave the neighbourhood (sending him, however, a guide, and a present of 5000 cowries,* as some recompense for his involuntary inhospitality), our traveller proceeded down the Niger, along the northern bank. On one occasion, while passing through the woods, he narrowly escaped being devoured by a large red lion, which he suddenly came upon, crouching in a bush, but which did not attack him. He proceeded first to Sansanding, thence to Moodiboo, Moorzan, and finally to Silla. Here, worn out by fatigue and suffering of mind and body, destitute of all means either of subsistence or of prosecuting his journey—for even his horse had dropped down by the way—his resolution and energy, of which no man ever possessed a greater share, began to fail him. The rainy season had set in, and he could only travel in a canoe, which he had no money to hire; and he was advancing farther and farther into the territories of the fanatical Moors, who looked upon him with loathing and detestation, and whose compassion he had no gifts to propitiate. It was with great anguish of mind that he was at last brought to the conviction of the necessity of returning; but no one who has read his own simple and manly statement of his actual situation, and of the prospect before him, together with his poignant sensations at his disappointment, can for a moment blame him for turning back. Preparatory to doing so, he collected all the information in his power respecting the future course of the Niger, and the various kingdoms through which it flowed; but subsequent discoveries have since proved how little credit could be attached to the accounts of the natives, either from their positive ignorance or their suspicious jealousy of strangers. Later, and more fortunate travellers, have solved the great problem, the honour of explaining which was denied to Park; and we now know that this great river, after flowing to a considerable distance eastward of Tombuctoo, makes a bend or elbow, like the Burampooter, and, after pursuing a south-westerly course, falls into the Atlantic Ocean, on the coast of Benin. The narrative of Mr Park's return from the interior of Africa would be little else than a repetition of the various sufferings, adventures, and dangers he experienced on his way there, but only in a more aggravated form, in consequence both of his utterly destitute condition, and from the inundation of the level country, which compelled him to seek his way over chasms and precipices, without a guide, or any other means of shaping his course. He frequently waded for miles breast-deep in water. Once he was beset by banditti, who stripped him of every thing but two shirts, his hat, and a pair of trousers; and on arriving at Sibidooloo, he was attacked by fever, which stretched him on his back for many weeks. Here, however, he was fortunate enough to meet with a slave-merchant, named Karfa Taura, who treated him with great kindness and humanity—took him into his own house—nursed him until he was well—kept him as his guest for seven months, without asking the smallest recompense—and finally conducted him in safety to Pisania, with a cargo of his living merchandise. Our traveller immediately took his passage in an American vessel, bound for the West Indies, whence he had no difficulty in getting to Britain, and landed at Falmouth on the 22d of December 1797, after an absence of two years and seven months. He instantly hastened to London, and the manner of his first interview with his kind kinsman Mr Dickson, who had long mourned for him as one lost, was perhaps as curious as any meeting of a similar nature that ever occurred. Mr Park arrived before day-break on Christmas morning, and thinking it rather an unseasonable hour to call up his relative, he strolled for some time about the streets, until, finding one of the entrances to the gardens of the British Museum accidentally open, he stepped in. Here the very first person he encountered was Mr Dickson himself, under whose management the gardens then were, and who happened, by mere chance, to have gone there that morning. The astonishment of both, but more particularly of the latter, at this rencontre, may be well imagined. Mr Park was received with distinguished honour by the African Association, and almost all the other scientific bodies and eminent literary characters of the metropolis, and was for some time, what is familiarly termed, the *lion* of the town. Having made arrangements in London for the publication of his travels, he proceeded to Scotland in June (1798), and spent the succeeding summer and autumn at his native place, Fowlshiels, amongst his relations and friends, his mother being the only parent then alive. His time, however, was far from being passed in idleness, or merely in social meetings with old friends and acquaintances, much as his company, as may readily be imagined, was sought after. He applied himself

* A cowrie is a small and rare shell, used as a species of currency in many of the eastern countries.

indefatigably to the compilation and composition of his travels, which he finished and carried back with him to London in the end of the year. In the following spring they were published, and it is needless to say how universally, or with what avidity, not to mention *incredibility* by many, they were read. For the latter contingency, Mr Park himself was prepared, and with a judicious caution, which few of his rivals in discovery, either before or since, have had the prudence or *self-denial*, as it may aptly be termed, to adopt, omitted the relation of many real incidents and adventures, which he feared might shake the probability of his narrative in the public estimation. This fact has been proved beyond doubt by the testimony of many of his intimate friends and relatives, to whom, although by no means of a communicative disposition, he freely mentioned many singular anecdotes and particulars, which he scrupled to submit to the jealous eye of the critical public. Amongst those friends to whom Mr Park frequently communicated in a colloquial way many most interesting and remarkable circumstances which did not appear in his printed travels, was the late Author of Waverley, between whom and Mr Park a strong intimacy was contracted subsequent to the return of the latter from Africa, and who tells us, that having once noticed to his friend the omissions in question (which appeared to one of his romantic temperament and ardent imagination to be unaccountable), and asked an explanation, Mr Park replied, "that in all cases where he had information to communicate, which he thought of importance to the public, he had stated the facts boldly, leaving it to his readers to give such credit to his statements as they might appear justly to deserve; but that he would not shock their credulity, or render his travels more marvellous, by introducing circumstances, which, however true, were of little or no moment, as they related solely to his own personal adventures and escapes." If this scrupulousness on the part of the traveller is to be regretted in one sense, as consigning to oblivion many curious and interesting facts, it certainly raises him as a man and an author incalculably in our estimation, and bespeaks the most implicit belief and confidence in what he *has* promulgated to the world.

After the publication of his travels, he returned to Scotland, and in August the same year married Miss Anderson, the eldest daughter of his old master at Selkirk.

An account of his second journey, and melancholy death, will form the subject of another article.

HORSES IN ANCIENT TIMES.

THERE is pretty good evidence for supposing, that, even at the time of the Trojan war, horses were but rare animals in Greece, and were possessed only by princes or great men, who employed them, not for the purposes of husbandry or draught, but for the ornamental displays of war and chariot-drawing, as the proud and distinctive accompaniment of royalty alone. In Judea, horses were, till the days of Solomon, very rare. Egypt is always described in the Old Testament as the land of horses. The earliest notice of the horse is in the Book of Genesis (chap. xlvii. 17), where Joseph is said to have given the Egyptians "bread in exchange for their horses." In the very minute enumeration of the cattle-stores of Abraham, Isaac, Esau, Laban, Job, &c., in the Book of Genesis, though there is a superabundance of other quadruped property, no mention whatever is made of horses. Neither, in the fourth or tenth commandments are horses noticed with the other working animals. In the enumeration, however, of the Egyptian cattle-property affected by the murrain, horses are mentioned in precedence of the rest. "Behold, the hand of the Lord is upon thy cattle which is in the field, *upon the horses*, upon the asses, upon the camels, upon the oxen, and upon the sheep."—Exod. ix. 3. In like manner, in the excellent and very particular description given by Theocritus of the quadruped stock of Angias, the child of the Sun, who lived in the Peloponnesus, horses find no place. Even during the Trojan war, these animals were only in the retinue of princes, and were always associated with cattle, or with the glorious forthcoming of kings. Accordingly, we find that in all the first descriptions of that animal, and particularly in that sublime and all-surpassing one in the Book of Job, he is depicted, with beauty and majesty, as the war-steed alone. Homer speaks of him always with dignity and admiration; and it is apparent, that, in his conceptions, an additional respectability is conferred upon his princes and his war-grooms by the title which he bestows upon them of "horse-tamers" and "horse-whippers"—a contemptible commendation, according to our ideas, associating, as we inevitably do, these epithets with the persons and mean employments of grooms of the stable and horse-jockeys. The ancient poets and ancient people must have connected, however, beauty, majesty, and sublimity, with their idea of that animal, not only from his noble shape and gallant appearance, but from his singularity, and, consequently, high price—his being the friend, as it were, and attendant, of princes—his being the terrible, yet graceful, accompaniment of war—and his being never seen, as in our modern times, degraded to the familiar yet far more beneficial purposes of draught in our streets, and husbandry in our fields. A modern reader, therefore, must enter somewhat into the sentiments and feelings of antiquity, in order to perceive the beauty or propriety of Theocritus's comparison of Helen to a horse, or of Solomon's likening his love "to a company of horses in Pharoah's chariots." The light in which the horse is thus considered as an ornament of royalty, or an appendage of war, not only ornamental, but efficient, is explanatory of many passages not only in the Old Testament, but in the Greek and Latin classics. In the Psalms of David,

> An horse for preservation is
> But a deceitful thing.—Ps. xxxiii. 17.

And in Eccles. x. 7, "I have seen servants on horses." In Deuteronomy, chap. xvii. 16, Moses forbids the Israelites, in the event of their electing from among themselves a king, to allow him "to multiply to himself horses," and thereby foster a lust of dominion and belligerent propensities, at the same time also creating, what the lawgiver wished much to prevent, too frequent a communication with Egypt. Egypt was undoubtedly, in the most early times, the great breeder of horses: the Old Testament proves it by many references. At Jacob's funeral, in Judea, there came forth from Egypt "chariots and horsemen a very great company." The Hebrews were pursued into the Red Sea by Egyptian horsemen; horse and rider were there overwhelmed. Solomon, several centuries afterwards, obtained all his horses from Egypt. With this testimony concurs the account given by the Greek writers; according to them, Sesostris [or Sesonchosis, as others write his name] was the first who taught men to tame horses and to ride them. In Solomon's days the price of a single horse from Egypt was 150 shekels, which, according to Bishop Cumberland's calculation of the shekel,* is about L.17, 10s. of our money—a great sum in those times. In the days of Xenophon, 600 years later than Solomon, the price of a good horse was about 50 danks, or L.27, 10s.—at least such was the price paid by Senthes the Thracian to Xenophon for the steed whereon he rode during his retreat from Babylon. Next after the Egyptians, the Assyrians became the celebrated cavaliers of the ancient world. These people are repeatedly alluded to by the Jewish prophets, not only as excelling in the beauty of their horses and skill of their horsemen, but also in all the showy apparatus of equestrian garniture. Their proficiency, however, in this branch of the military art, took place long after the Egyptians had invented and brought it to some degree of perfection, which the Medes, Assyrians, and Persians, possessing more gold and silver, from their more enlarged empires, decked and bespangled more with blue, with purple, and with gold, "clothing their horsemen most gorgeously." Persia became latterly most renowned for its horse-riding. Xenophon declares, that, before the age of Cyrus, Persia had, from its want of wealth, or the mountainous character of its soil, no horses; but that, after his time, from the personal example, and encouragements, and recommendations of their king, every man in Persia rode on horseback; so much so, indeed, that it is understood that the very name of Persia, by which ever afterwards their country became known, was taken from PERESH, a word in Chaldee and Hebrew signifying a horseman. Immense numbers of these animals were reared in the plains of Assyria and Persia. We read in some author of no less than 150,000 feeding on one vast plain near the Caspian Gates. The Nysæan horses, which the kings of Persia used in their expeditions, were celebrated as the finest in the world. In Greece, the art of riding horses, and most probably the arrival of the horse himself, did not long precede the Trojan war. The story of the Centaurs, *semi-human horses and semi-equine* men, as Ovid calls them, warrants the inference that horses then first made their appearance in Thessaly, if not in Greece. These people lived about a century before the Trojan war; for Chiron, who was their chief, was the preceptor of Achilles. As the poor Mexicans at the first appearance of the Spanish cavalry ran off in a fright, conceiving that man and horse were but one animal, so the people of Thessaly fled, panic struck, at the sight of the double-shaped incomprehensible monster that charged them. It is almost certain that these Centaurs were a tribe of Pelasgi, or emigrants from Phrygia, and the southern shores of the Euxine Sea, which were occupied at an early period by a colony of Egyptians, planted there by Sesostris in his Phrygian and Scythian expedition. Confirmatory of this derivation, is the Grecian tradition, as recorded by her antiquaries, that Philyre, the mother of the Centaurs, cohabited with Saturn in Philyreis, an island near the southern shore of the Euxine; and that from that island she emigrated to Thessaly and the mountains of the Pelasgi. In this way, one might amuse himself by attempting to trace, even from the few data afforded by history, the circuit by which horses, with the consequent art of equestrian exercise, passed from Egypt, the original and central riding-school of the world, into Greece and into Europe. From Egypt they passed into Assyria and Persia; from Assyria to Cappadocia, Amazonia, and Pontus, countries where horses were most reared, most admired, and, as the most admirable objects in animated nature, offered up as sacrifices to the sun; from Pontus they passed, with the streams of westward-rushing population, to Phrygia and the southern banks of the Propontis; and from thence, with "horse-taming" Pelops and the Pelasgi, they migrated into Thessaly, and confounded with their novel and terrifying appearance the simple and aboriginal inhabitants, to whom "the horse and his rider" seemed a monster outlandish and inscrutable! It was not customary in these ancient times to shoe horses with iron, according to our modern practice; so that a strong hoof, "hard as brass" and solid "as the flint," was reckoned one of the good qualities of a steed. In oriental countries, the dryness of the roads rendered this fortification of the hoof less necessary; the muddy ways and miriness of the ground's surface in the north of Europe, I suppose, first caused and confirmed the practice. Hannibal's cavalry, which were principally Numidian, lost all their hoofs in the miry and embarrassing march through the marshy ground between Trebia and Fesulæ. The horses of the ancients had no saddles,* no stirrups, and the Numidian horses had even no bridles; but their armour and their trappings must have compensated for these deficiencies by its extraordinary splendour.†

* If we take Xenophon's valuation of the shekel, as containing 7½ oboli, as stated in Lib. I. of his Expedition of Cyrus, it makes the price much less, about L.6, 5s.

* Yet I find saddles mentioned in our translation of the Bible, Leviticus xv. 9; and in Num. xxii. 21, Balaam *saddled* his ass.

† From "Shreds of Antiquity," an unpublished work of Mr Tenant, author of "Anster Fair."

THE LAST MOMENTS OF ROBERT BRUCE, KING OF SCOTLAND.

Meanwhile, King Robert of Scotland became sore oppressed with age and weakness, being grievously afflicted with the great sickness, so that there remained no way with him but death. And when he felt that his end drew near, he sent for those barons and lords of his realm, in whose loyalty he had the greatest confidence, and affectionately enjoined them, on their fealty, that they should faithfully keep his kingdom for David, his son, promising to obey him, and place the crown upon his head when he attained the full age: after which, he beckoned that brave and gentle knight, Sir James Douglas, to come near, and thus addressed him in presence of the rest of his courtiers:—"Sir James, my dear friend, few know better than yourself the great toil and suffering which, in my day, I have undergone for the maintenance of the rights of this kingdom; and when all went hardest against me, I made a vow, which it now deeply grieves me not to have accomplished: I then vowed to God, that if it were his sovereign pleasure to permit me to see an end of my wars, and to establish me in peace and security in the government of this realm, I would then proceed in person to the Holy Land, and carry on war against the enemies of my Lord and Saviour, to the best and utmost of my power. Never hath my heart ceased to bend earnestly to this purpose, but it hath pleased our Lord to deny me my wishes, for I have had my hands full in my days, and, at the last, you see me taken with this grievous sickness, so that I have nothing to do but to die. Since, therefore, this poor frail body cannot go thither, and accomplish that which my heart hath so much desired, I have resolved to send my heart there, in place of my body, to fulfil my vow; and because, in my whole kingdom, I know not any knight more hardy than yourself, or more thoroughly furnished with all those knightly qualities requisite for the accomplishment of this vow, it is my earnest request to thee, my beloved and tried friend, that, for the love you bear me, you will, instead of myself, undertake this voyage, and acquit my soul of its debt to my Saviour; for, believe me, I hold this opinion of your truth and nobleness, that whatever you once undertake, you will not rest till you successfully accomplish; and thus shall I die in peace, if you will do all that I shall enjoin you. It is my desire, then, that as soon as I am dead, you take the heart out of my body, and cause it to be embalmed, and spare not to take as much of my treasure as appears sufficient to defray the expenses of your journey, both for yourself and your companions; and that you carry my heart along with you, and deposit it in the Holy Sepulchre of our Lord, since this poor body cannot go thither. And I do moreover command, that in the course of your journey you keep up that royal state and maintenance, both for yourself and your companions, that into whatever lands or cities you may come, all may know you have in charge to bear beyond seas the heart of King Robert of Scotland." At these words, all who stood by began to weep; and when Sir James himself was able to reply, he said, "Ah, most gentle and noble king, a thousand times do I thank you for the great honour you have done me in permitting me to be the keeper and bearer of so great and precious a treasure. Most willingly, and, to the best of my power, most faithfully, shall I obey your commands, although I do truly think myself little worthy to achieve so high an enterprise." "My dear friend," said the king, "I heartily thank you, provided you promise to do my bidding on the word of a true and loyal knight." "Undoubtedly, my liege, I do promise so," replied Douglas, "by the faith which I owe to God, and to the order to which I belong." "Now praise be to God," said the king, "I shall die in peace, since I am assured that the best and most valiant knight in my kingdom hath promised to achieve for me that which I myself never could accomplish:" and not long after, this noble monarch departed this life.—*From Froissart's Chronicles.*

BEAR-HUNTING.

The following incident at bear-hunting is recorded by Mr Lloyd, in his Field Sports in the North of Europe. The scene took place in Scandinavia, where the sport is performed by a great number of people assembling, and, forming a large circle, gradually close it, and force the animals from their retreat. This species of amusement is called a *skall* in the country.

"The skall to which this anecdote relates," says Mr Lloyd, "and at which Captain Eurenius himself was present, took place about the year 1790, in the parish of Yestram, province of Wernersborg. It was conducted in the usual manner, every person having his proper position assigned to him. One man, however, an old soldier, who was attached to the hallet, or stationary division of the skall, thought proper to place himself in advance of the rest, in a narrow defile, through which, from his knowledge of the country, he thought it probable the bear would pass. He was right in his conjecture; for the animal soon afterwards made his appearance, and faced directly towards him. On this he levelled, and attempted to discharge his piece, but owing to the morning being wet, the priming had got damp, and the gun missed fire. The bear was now close upon him, though it was probable that, if he had stepped to the one side, he might still have escaped; but instead of adopting this prudent course, he attempted to drive the muzzle of his gun, to which, however, no bayonet was attached, down the throat of the enraged brute. This attack the bear parried with the skill of a fencing-master; when, after wresting the gun out of the hands of the man, he quickly laid him prostrate.

"All might have ended well; for the bear, after smelling at his antagonist, who was lying motionless and holding his breath, as if he had been dead, left him almost unhurt. The animal then went to the gun, which was only at two or three feet distance, and began to overhaul it with his paws. The poor soldier, however, who had brought his musket to the skall contrary to the orders of his officers, and knowing that if it was injured, he should be severely punished, on seeing the apparent jeopardy in which it was placed, quietly stretched out his hand, and laid hold of one end of it, the bear having it fast by the other. On observing this movement, and that the man in consequence was alive, the bear again attacked him; when, seizing him with his teeth by the back of the head, as he was lying with his face on the ground, he tore off the whole of his scalp, from the nape of the neck upwards, so that it merely hung to the forehead by a strip of skin. The poor fellow, who knew that his safety depended upon his remaining motionless, kept as quiet as he was able; and the bear, without doing him much farther injury, laid himself along his body.

"Whilst this was going forward, many of the people, and Captain Eurenius among the rest, suspecting what had happened, hastened towards the spot, and advanced within twelve or fifteen paces of the scene of action. Here they found the bear still lying upon the body of the unfortunate man. Sometimes the animal was occupying himself in licking the blood from his bare skull, and at others in eyeing the people. All, however, were afraid to fire, thinking either that they might hit the man, or that, even if they killed the bear, he might, in his last agonies, still farther mutilate the poor sufferer. In this position the soldier and the bear remained a considerable time, until at last the latter quitted his victim, and slowly began to retreat, when a tremendous fire opened upon him, and he instantly fell dead.

"On hearing the shots, the poor soldier jumped up, his scalp hanging over his face, so as completely to blind him; when, throwing it back with his hands, he ran towards his comrades like a madman, frantically exclaiming, 'The bear! the bear!' The mischief, however, was done, and was irreparable. The only assistance he could receive was rendered to him by a surgeon who happened to be present, and who severed the little skin which connected the scalp with the forehead, and then dressed the wound in the best manner he was able. The scalp, when separated from the head, Captain Eurenius described as exactly resembling a *peruke*.

"In one sense, the catastrophe was fortunate for the poor soldier. At the time, every one in the army was obliged to wear his hair of a certain form, which was extremely troublesome to dress and keep in order during the day; and he, in consequence, being now without any, immediately got his discharge.

"Bears are not unfrequently domesticated in Wermeland. I heard of one that was so tame that his master, a peasant, used occasionally to cause him to stand at the back of his sledge when on a journey; but the fellow kept so good a balance that it was next to impossible to upset him. When the vehicle went on one side, Bruin threw his weight the other way, and *vice versa*. One day, however, the peasant amused himself by driving over the very worst ground he could find, with the intention, if possible, of throwing him off his equilibrium, by which, at last, the animal got so irritated, that he fetched his master, who was in advance of him, a tremendous thwack on his shoulders with his paw. This frightened the man so much, that he caused the bear to be killed immediately."

THE ORIGIN OF THE PORTEOUS MOB.

The origin of the Porteous mob continued long to exercise the curiosity of those by whom the event was remembered, and from the extraordinary mixture of prudence and audacity with which the purpose of the multitude had been conceived and executed, as well as the impenetrable secrecy with which the enterprise was carried through, the public were much inclined to suspect that there had been among its actors men of rank and character, far superior to that belonging to the multitude who were the ostensible agents. Broken and imperfect stories were told of men in the disguise of women, and of common artizans, whose manner betrayed a sex and manners different from what their garb announced. Others laughed at these unauthorized exaggerations, and contended that no class were so likely to frame or execute the plan for the murder of the police-officer, as the populace to whom his official proceedings had rendered him obnoxious, and that the secrecy so wonderfully preserved on the occasion arose out of the constancy and fidelity which the Scottish people observe towards each other when engaged in a common cause. Nothing is, or probably ever will be, known with certainty on the subject; but it is understood that several young men left Scotland in apprehension of the strict scrutiny which was made into that night's proceedings; and in your grandfather's younger days, the voice of fame pointed out individuals, who, long absent from that country, had returned from the East and West Indies in improved circumstances, as persons who had fled abroad on account of the Porteous mob. One story of the origin of the conspiracy was stated to me with so much authority, and seemed in itself so simple and satisfactory, that although the degree of proof, upon investigation, fell far short of what was necessary as full evidence, I cannot help considering it as the most probable account of the mysterious affair. A man, who long bore an excellent character, and filled a place of some trust as forester and carpenter to a gentleman of fortune in Fife, was affirmed to have made a confession on his death-bed, that he had been not only one of the actors in the hanging of Porteous, but one of the secret few by whom the deed was schemed and set on foot. Twelve persons of the village of Pathhead—so this man's narrative was said to proceed—resolved that Porteous should die, to atone for the life of Wilson, with whom many of them had been connected by the ties of friendship and joint adventure in illicit trade, and for the death of those shot at the execution. This vengeful band crossed the Forth by different ferries, and met together at a solitary place near the city, where they distributed the party which were to act in the business which they had in hand; and giving a beginning to the enterprise, soon saw it undertaken by the populace of the city, whose minds were precisely in that state of irritability which disposed them to follow the example of a few desperate men. According to this account, most of the original devisers of the scheme fled to foreign parts, the surprise of the usual authorities having occasioned some days to pass over ere the investigations of the affair were commenced. On making inquiry of the surviving family of this old man, they were found disposed to treat the rumoured confession as a fiction, and to allege, that although he was of an age which seemed to support the story, and had gone abroad shortly after the Porteous mob, yet he had never acknowledged any accession to it, but, on the contrary, maintained his innocence, when taxed, as he sometimes was, with having a concern in the affair. The report, however, though probably untrue in many of its circumstances, yet seems to give a very probable account of the origin of the riot, in the vindictive purpose of a few resolute men, whose example was quickly followed by the multitude, already in a state of mind to catch fire from the slightest spark.—*Tales of a Grandfather, Third Series.*

REPORT OF THE COMMITTEE ON STEAM CARRIAGES.

In the progress of their inquiry, the Committee extended their examination to the principal objections which had been urged to the application of steam on common roads. These were, the danger of explosion, the annoyance to travellers, the fright occasioned to horses by the noise of the machinery, and the smoke and steam which escape at the chimney. The Committee state, that they are led to believe, by the result of their inquiries, that the substitution of inanimate for animal power on common roads, is one of the most important improvements in internal communication ever introduced; that its practicability has been fully established; that tolls to an amount which would utterly prohibit the introduction of steam carriages have been imposed on some roads; that on others the trustees have adopted measures which place such carriages in an unfair position compared with ordinary coaches; and that the causes of these measures are two-fold—1st, A determination on the part of the trustees to obstruct as much as possible the use of steam as a propelling power; and, 2d, The misapprehension of its effects on roads. The Committee consider that legislative protection should be extended to steam carriages with the least possible delay. Their Report goes on to say—"Without increase of cost, we shall obtain a power which will insure a rapidity of internal communication far beyond the utmost speed of horses in draught. Nor are the advantages of steam power confined to the greater velocity attained, or to its greater cheapness than horse draught. In the latter, danger is increased, in as large a proportion as expense, by greater speed. In steam power, on the contrary, there is no danger of being run away with, and that of being overturned is greatly diminished. It is difficult to control four such horses as can draw a heavy carriage ten miles per hour, in case they are frightened or choose to run away; and, for quick travelling, they must be kept in that state of courage that they are always inclined for running away, particularly down hills and at sharp turns of the road. In steam, however, there is little corresponding danger, being perfectly controllable, and capable of exerting its power in reverse in going down hills." Steam has been applied as a power in draught in two ways: in the one, both passengers and engine are placed on the same carriage; in the other, the engine carriage is merely used to draw the carriage in which the load is conveyed. In either case, the probability of danger from explosion has been rendered infinitely small, from the judicious construction of boiler which has been adopted. The danger arising to passengers from the breaking of the machinery need scarcely be taken into consideration. It is a mere question of delay, and can scarcely exceed in frequency the casualties which may occur with horses. It has been frequently urged against these carriages, that, wherever they shall be introduced, they must effectually prevent all other travelling on the road, as no horse will bear quietly the noise and smoke of the engine. The Committee believe that these statements are unfounded. Whatever noise may be complained of, arises from the present defective construction of the machinery, and will be corrected as the makers of such carriages gain greater experience. Admitting even that the present engines do work with some noise, the effect on horses has been greatly exaggerated. All the witnesses accustomed to travel in these carriages, even on the crowded roads adjacent to the metropolis, have stated that horses are very seldom frightened in passing.—*Edinburgh Review.*

AN AULD WIFE'S ADDRESS TO THE MOON.

You are rising, O Moon, through the thicket of trees,
Like a house gane afire, or a stack in a bleeze;
But soon through the lift wilt thou glitter and speel,
Like a round pewter plate, or the rim of my wheel.
Mony years have passed over my haffits and thine,
Since Johnny and I used to court in thy shine;
But you are as bright, and as plump as of yore,
While I'm an auld woman, three years and three score;
And John, though I've kept him baith tenty and snug,
Has ringlets as grey as the cloud at thy lug:
But you are still sparkling, and still in thy light
Daft hempies, as I was, are courting at night.
I have gazed at you oft as you shone at your post,
In nights when the starnies were broonding wi' frost;
And oft when the hurricane whunnered away,
And whommeled our stacks like a cole on the brae,
I have wondered full oft, as it tookit and blew,
If ever its sughing was eerie to you.
Ae night it uprooted the auld clachan-tree,
And I thought that the roof of our sit-house would flee;
But you laughed at its blawing, and kept thee as still,
As over the mist stands the peak of a hill.
—One question to ask thee, my wonderment begs—
How, Moon, have you skill in the clecking of eggs?
If I set my brood hen when thy waxing I see,
I am sure that the lauchter will never misgie;
The chickens are strong, and their number is full,
And the tod and the corbie get never a pull:
But if I should set them when pale is thy horn,
Waxing thinner and dimmer at rising of morn,
Then shilpit and cowering the chickens will be,
Tho' hatched in a bush mid the whins of the lea.
And tell me, how is it that thou hast the skill,
To manage the time when our pork we maun kill?
About Martinmas day thy first glimpse in the sky,
Is a sign for fat pigs to grow fatter, and die;
Thy waxing foretells that the hams of the gryce,
Will swell in the pot, and be tender and nice;
But if till thy waning, he grunt in his crib,
Nae kail will be lyth'd by the fat of his rib.
What gives thee such skill? Once a sailor I saw
Who said that your word to the sea is a law,
That it rises or falls as you come or retreat;
But I cannot believe you can do such a feat:
'Tis wonder enough if on chickens and pork
Your waxing and waning such wonders can work.
But the evening is growing—my lamp must be got,
And Johnny's bit supper prepared for the pot.
My lamp, Lady Moon, should be steady and bright,
For its rush-wick was cut with the moon at its height
I gathered the thrashies when you were on high,
And your image shone bright in the burnie hard bye:
Such wicks have a glamour they borrow from you,
And their light in the evening is constant and true,
While Johnny works stockings and hosts by the fire,
And I'm at my wheel, and whiles in to the byre.
I'm wearied wi' spinning: my finger and thumb
I smokit wi' reek frae a nievefu' o' broom,
Till the skin was like leather; but soon wi' a nick
The lang weary thread cuttit in to the quick.
O Moon, there's a cloud comin' black on thy face,
Wi' sleet or wi' snaw it is brewin' apace:
You're a skeelly auld witch!—you had kent it vestreen,
When you drew yon white brough round your haffits at e'en
I thought you were bodin' some mischief at hand—
And now comes the hurricane over the land.
I wis my poor Johnny were hame frae his wark,
The snaw will be on, and the night will be dark.
Ou! there is our Johnny! how clever he comes;
He doesna look auld yet—See, darker it glooms.
Ah, Johnny, you're welcome! the door let us steek—
Now snaw, wind, and moonlight, may fight as they like.—D. M.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 70. SATURDAY, JUNE 1, 1833. PRICE THREE HALFPENCE.

TOM BRIMS.

It appears to be a prevailing impression, in consequence of the strain of our fictitious literature, that there is no pathos any where, except in either very refined society, or among a rural population. No one seems to think that there can ever be any sentiment in the situation of a shopkeeper, or that feeling, any more than friendship, is to be found in trade. This notion, I am persuaded, has arisen solely from the circumstance, that poets and story-writers, finding some difficulty in managing the current of a pathetic tale amidst the common-place details of business, have invariably looked elsewhere for characters and scenery: it is entirely a matter of literary convenience. Thus, though we see every day the most striking turns of fortune in mercantile life, accompanied by distresses of the most touching kind, such is nevertheless the habit into which our reading has thrown us, that we would be apt to think it very odd if a tragedy, or even the simplest sentimental tale, were attempted to be woven from such a tissue.

Though not insensible to the danger of going right against the stream of popular taste, I am induced to do so on the present occasion, in order to commemorate an individual whose fate made a deep impression upon me in my earlier years, and in whose story, referring though it does to mere trade, I cannot help believing that the public will, like myself, feel somewhat interested. No tale could be simpler in its pathos, or less involved in its parts; and yet I never can think of it without a degree of sympathising sadness, which might now-a-days be refused to the most lordly and the most complicated sorrows of the stage.

Thomas Brims had been reared, I believe, as a traveller for a *house* in Yorkshire, which dealt largely in leather caps and braces. When I first knew him, he was a handsome middle-aged and middle-sized man, always dressed in the very extreme of the prevailing fashion, yet with an easiness of manner which is not often found in carefully dressed men. It was alleged of Brims that he had been such an exquisite in his earlier years as to sleep in doe-skin gloves for the purpose of whitening his hands. But this was perhaps a fiction. No man ever took the head of the table in a *travellers' room* with less exceptionable pretensions to the honour than he. Clever, well-bred, good-humoured, and an admirable teller of stories, he seemed to possess every qualification for that important post; and it was accordingly acceded to him on all occasions, even though there might be present an individual who had been longer upon the road. When a little elevated after dinner, Brims became so delightful a companion, that gentlemen who had intended to call upon a few customers in the evening totally forgot their purpose—forgot time, business, and every thing—and sat still, enchained, it might be said, by the social spirit of their preses. Brims was reputed to be one of the cleverest salesmen in England; and it is more than probable, that, if the same abilities had been devoted to a learned profession, or to some species of state-service, he would have risen to considerable honours.

Such was Brims when I first knew him. He was then in the habit of annually visiting the country town in which I resided; and as my father was one of the traders with whom he did business, I had ample opportunities of observing the character of the man. He was, however, an object of interest to many besides those with whom he was any way connected in business. His neat gig and spirited horse were recognised as they entered the town, even before his own person was distinguished; and when he was alighting at the door of the inn, the equipage was surrounded by a far greater crowd of boys than what was usually gathered at the advent of any other stranger. "Brims is come! Brims is come!" was echoed from mouth to mouth; and in ten minutes the fact was known to the whole population. Happy was the boy who, from his acquaintance with the waiter, was permitted to carry any of Brims's bags or boxes into the house; and delighted above all measure was he, who, from his being highest in the good graces of the hostler, was entrusted with the mighty honour of taking Brims's horse to the water. The style in which Brims moved, and the success with which he pursued his trade, altogether gave him, at this period, the appearance of a happy and prosperous man.

Some years of adverse fortune ensued, both with my own family and with Brims. With the causes of our own misfortunes I am but too well acquainted; but I never could learn, nor even guess, how so expert a man as Brims should have sunk, in the meridian of life, from a line of employment for which he seemed so admirably qualified. After having lost sight of him for several years, we met him in another country town—one very near the Scottish capital—to which we had been induced to remove in the hope of bettering our circumstances. Brims, to our surprise, was also resident there. He lived with his wife and his boys (so he termed three grown-up lads) in a small and rather mean-looking house, at no great distance from our own. Eight years had wrought a change in the prompt and sprightly traveller; yet, while his countenance wanted its former sparkle, his clothes were still almost as good and as neat as ever, and even, amidst the details of a very humble household, he carried as much of the air of a gentleman as in his better days. He was also engaged in the same business as formerly; but, alas, upon what a different scale! Instead of selling his wares in large quantities, and over the country at large, he now employed himself and his boys in manufacturing them with their own hands, and sought no more extensive market than what was supplied by some of the inferior retail dealers in Edinburgh. Once or twice a-week he dressed himself in his trim, though rather overbrushed suit of black, and, with a neat leather-covered parcel under his arm, walked to the city—even the stage-coach being above his resources—where he busied himself for the day in making sales; and I have been given to understand, that, on such occasions, he displayed exactly the same persuasiveness of manner, and the same eloquence in describing his goods, as he had ever done in his better days, when selling leather caps by the thousand instead of the dozen. The contrast, however, was that of a blood hunter reduced to the cart, which, though it may carry a somewhat higher head than the common work-horse, yet is every whit as stayed in its demeanour, and as thoroughly reconciled to its situation.

In the course of time, some changes took place in Brims's little household. His wife—a genteel, quiet Englishwoman—died; and his two elder sons, fretting at the hopeless drudgery to which they were bound by their father, left him to seek their own fortune in the wide world. He suffered alike severely from these calamities, yet hardly permitted a complaint to escape him. He was now left alone with his youngest son Alfred, a tiny and delicate youth, whose very beauty showed that he was not long for this world. His little manufactory was now still smaller than ever; but it was enough for the demand. Leather caps about this time began to be disused, on account of the popularity which Highland bonnets acquired from the glory of the Scottish regiments at Waterloo. Even braces, as Brims used to remark pathetically, appeared to be less used than formerly, insomuch that it was a kind of wonder to him how the inexpressibles of mankind were kept up at all. He now seldom went to Edinburgh oftener than once in the ten days; and I used to remark, with much regret, that his neat leather parcel was sometimes at his return not altogether discharged of its contents. Still Alfred was sure to have his tea (his favourite and only indulgence) warm for him when he arrived, and, even amidst something approaching to penury, he appeared to be content.

There was something beyond measure affecting in the attachment of these two lonely beings to each other Poor Brims, after the loss of his wife and the departure of his elder sons (of whom he never afterwards heard), appeared to cling only the more fondly to Alfred, who was now, it might be said, the sole stay and hope of his old age. He felt also those fond terrors which so readily possess a parent's heart respecting a delicate child; and fear gave a convulsive energy to that embrace in which love disposed him to hold this fragile plant. On the other hand, Alfred, with a degree of sense and feeling beyond his years, deplored the unfortunate circumstances of his father, and seemed eagerly anxious, by every kind of personal attention, as well as by taking a full share of his labours, to compensate the desolation of his age. Neither had any other object on earth to care for; each, of course, gave his heart entirely to the other; and if even opposite natures are forced sometimes to coalesce for defence against a common danger, it may be imagined how these kindred souls blent together, for mutual support against solitude and sorrow.

Time wore on, and Brims's trade always got worse and worse, till at length he declared it to be hardly possible for him and his son to earn as much as could support them in even the most parsimonious manner. In the increased necessity of labour, he endeavoured to take as much upon himself as possible, in order to save the slender frame of Alfred; while, with the view of continuing certain comforts which the health of that individual rendered more necessary than ever, he pinched so much from his own daily necessaries as almost left him in the feigned condition of the camelion. But for the self-denial of his son, who adopted every means in his power to lessen the toils and improve the comforts of his father, he must have speedily destroyed his own health. There was now a generous rivalry between the two, which to labour most, and which to require least personal indulgence; each endeavouring, as it were, to arrest the busy hand of the other, and to force into the mouth of his companion the hard-earned morsel which was fairly due to himself. At length, the gentle Alfred sunk fairly beneath the premature hardships to which he was condemned, and his father *knew* the appalling fact, that, while there was still some chance of life, if relaxation, exercise, change of air, and an improved regimen, could be afforded to the patient, there was none otherwise, and, of course, as matters stood, none at all.

As the only individuals in the place whom Brims had known in his better days, he selected us at this time to receive the recital of his sorrows. What gave, he said, the most poignant wound to his mind, was the unfeeling coldness with which a wealthy brother-in-law had lately treated an application he had made for relief. This individual was not only wealthy, but had no one dependent on him; and yet, such was his reluctance to part with any part of his hoards, that even the small sum necessary to try an experiment for the health of his nephew had been refused.

Whether the case might stand exactly upon the grounds described by Brims, we could not tell: if so, it was certainly among the hardest we had ever known; but probably there was some cause of wrath against our unfortunate friend, with which his self-love would not permit him to make us acquainted.

As might have been expected, the young man declined slowly, but surely, towards the grave, notwithstanding all that we, and other persons interested in him, could do to stay his progress. I was present on the evening when he died, and never shall forget the picture of human woe which the surviving parent exhibited on that occasion. The dying youth was stretched on a little bed, in a meanly furnished room, with no other attendant besides his father than a poor old woman who lived in another part of the same house, and had come in to inquire if she could be of any use. Close over his pale and death-like countenance hung his father, whose disordered dress and exhausted look showed but too plainly the extremity to which watchfulness and anxiety had reduced him. For hours the young man had not showed the least sign of consciousness; and the doctor, when called away, some time before, to attend a more hopeful patient, had pronounced that he could not live two hours longer. The father, however, was still unsatisfied—what parent, in such circumstances, can ever be so?—and was every now and then bringing forward a spoonful of medicine to pour upon the parched lips of his son, in doing which he generally asked the unavailing question, "Alfred, my dear boy, do you not know your father?"

Just before the last fatal moment, the sun came round and shone into the apartment, and, in obedience to a motion from Mr Brims, I went to the window to close a part of the shutter. How strange, I thought, to see this cheerful light gilding the objects of a death-chamber with as much brilliancy as if they belonged to some splendid and festive scene! Before I could accomplish what I was about, the increase of light seemed to break up for a moment the slumber of the dying youth, and he cast a hesitating and languid look towards the window. "Oh, leave the shutter as it is," said the father eagerly, as if afraid to deprive his child of any thing that could be supposed, even at this last darkening hour, to give him any pleasure. It was only for a moment, however, that the eye remained open to this new impression. It closed immediately; and, in a minute after, one convulsive movement in the youth, and a burst of overpowering grief from the father, informed me that death had done his work.

Other females from the neighbourhood now came crowding in, and were permitted by Brims to perform the last offices to his son. That night he was pressed by my father, in the most earnest and friendly manner, to take up his abode with us; but nothing could prevail upon him to quit his own desolate house, and we were accordingly obliged to leave him, though not till we had seen another room arranged properly for his reception, and provisions laid in for his use. Our attention, alas! was unnecessary. Brims was found next morning stretched lifeless beside the body of his son—his own bed unpressed—his meat untasted. Upon the table which had been spread for him lay a scrap of paper, on which were inscribed the words, "It is too late." Nothing else was to be learned, except that a spirit, deserted by all the objects of its affection, and oppressed with misfortunes too heavy to be endured, had sunk beneath its griefs, and fled to rejoin all it held dear in another and better world.

NATURAL HISTORY.

The Polar Bear.—This immense animal differs in many particulars from the rest of its congeners. Captain Lyon, when on the northern expedition, killed one which measured eight feet seven inches and a half in length, and was sixteen hundred pounds weight.

This species inhabits the confines of the arctic circle, and has been found about the latitude of the 80th degree, and even as far northwards as navigators have yet penetrated into those inhospitable seas, which seem to accord well with the sullen and ferocious nature of this terrible animal. In the words of the poet,

> ——"there the shapeless bear,
> With dangling ice all horrid, stalks forlorn:
> Slow pac'd, and sourer as the storms increase,
> He makes his bed beneath the inclement drift;
> And, with stern patience, scorning meek complaint,
> Hardens his heart against assailing want."

This animal has never been found farther south than Newfoundland, and his chief residences are the shores of Hudson's Bay, Spitzbergen, and Greenland, on the one side of the arctic circle, and Nova Zembla on the other. Insulated instances have occurred of the polar bear having been carried on floating icebergs to the coasts of Iceland and Norway.

The polar bear feeds entirely on animal matter, but his habits are not decidedly predatory, for he prefers dead animals to those in a living state, subsisting chiefly on the floating carcases of whales, after they have been stript of their blubber by those employed in the whale fisheries. He sometimes, however, preys upon seals, which he catches when they ascend to the surface to breathe. As this bear swims with much ease, he is very capable of capturing his prey, and not unfrequently takes fish when they enter gulfs or shoals.

The polar bear is greatly attached to its offspring, and will die in their defence. This is finely illustrated by an incident which was witnessed by Captain Phipps, of the Carcass, when on his voyage of discovery to the north pole. While locked in the ice, it was intimated by the man at the mast-head that three bears were approaching towards the vessel. They had been directed to the spot by the smell of some blubber of a walrus, which had been killed by the sailors a few days before, and which they had set fire to, and were burning it on the ice at the time they were advancing. When they reached the vessel, they turned out to be a female and two cubs, the latter of which were, however, nearly as large as their mother. They appeared to be very hungry, for they ran towards the fire, and drew from the flames the parts of the walrus which were yet unconsumed, and devoured them with great voracity. The sailors threw from the side of the vessel large pieces of the flesh that were still left, which the dam carried away, and dividing them, laid them before the young ones, and only reserved a small portion for herself. When the old one was carrying away the last piece, the crew levelled their muskets at the cubs, and killed them both on the spot; and also firing at the dam, wounded her, although not mortally. It would have drawn tears of pity from any one possessed of feeling, to have marked the affectionate concern evinced by the poor animal while her young were in the agonies of death. She was so severely wounded, that she could but crawl to the spot where her cubs lay, carrying with her the piece of flesh which she had last taken away, after having torn it asunder, as she had done with the others, and placed it before them. When she perceived that they refused to eat, she laid her paws first on the one, and then on the other, endeavouring to raise them up, while she at the same time uttered the most pitiable moans. When she found her efforts to raise them were unavailing, she retreated; and, having got to some distance, she looked back, and uttered deep moans; and seeing that had no effect in making them follow her, she returned, and smelling round them, began to lick the blood from their wounds. She retired a second time, and having with difficulty crawled a few paces off, again looked behind her, and stood for some time uttering heart-rending moans. But still finding that her cubs did not follow her, she returned to them again, and, with marks of the utmost tenderness, went round each successively, pawing them. Finding at length that they were cold and lifeless, she raised her head towards the ship, growled a curse upon the destroyers of her offspring, which they returned with a volley of musket balls, when she fell prostrate between her cubs, and died in the act of licking their wounds.

Brentz, in his voyage in search of the north-east passage to China, witnessed various striking instances of the ferocity of polar bears in Nova Zembla, where they attacked his seamen and actually carried them off in their mouths, with the greatest apparent ease, and devoured them in the presence of their companions.

About twenty-two years ago, the crew of one of the whale fishery boats fired at and wounded a polar bear, which was at some little distance from them. He set up a dreadful howl, and ran, with all his speed, along the ice towards the boat; and attempting to board it, placed one of his fore-paws on the gunwale, and would have speedily entered the boat, had not one of the sailors seized a hatchet and cut off his paw. But this severe injury did not damp his courage; for he pursued the boat till it reached the vessel, from whence many shots were fired at him without inflicting a mortal wound. He reached the vessel, and contrived to ascend the deck, where he ranged about with the greatest possible fury, and spread such consternation among the crew, that they all fled into the shrouds for safety, where he next prepared to pursue them, but was luckily hit by a ball, which terminated his existence.

The master of a Greenland whaler wishing to procure a bear without injuring the skin, endeavoured to entrap one by laying the noose of a rope in the snow, and placing a piece of beef within it; and afterwards fire was put to it. A bear was soon attracted by the smell; he perceived the meat, and, approaching, seized it, and was sneaking off, but found his feet entangled by the noose; he, however, soon perceived his situation, pushed it off with his paw, and deliberately retired and devoured the piece of meat at his leisure: after which he returned. The noose was again baited with another piece of meat; he walked quietly up to it, and pushing the noose aside, seized the meat, and made good his retreat. The noose was a third time baited; but the seamen observing the caution of the bear, buried the rope beneath the snow, to elude his observation, and laid the meat in a deep hole which they dug in the centre. The bear once more advanced, and the sailors here now conceived themselves certain of success. But the animal, more sagacious than they expected, after smelling about the place for some seconds, scraped the snow away with his paw, and pushing the rope aside, again seized the meat and made off in safety.

The Racoon is a native of the warmer regions of South America, where they commit great havoc among the plantations of sugar-canes, as they make descents in large flocks.

This animal is less than the badger, and somewhat resembles the fox in the form of its head: its ears are, however, much rounder, shorter, and less pointed; its eyes are large, full, and surrounded by two broad patches of black; its body is thick, short, and covered with long hair, which is grey underneath, and black at the tips. The tail is long, bushy, and marked with alternate rings of black and white.

In a state of domestication the racoon is very sportive and good-tempered, and of a disposition not less inquisitive than the monkey. It examines every object with its paws, which it uses in the manner of hands, to see every thing which is given to it. It is as sly and cunning as a fox, and, like it, is very destructive of poultry. It is said to feed on insects, and opens oysters with astonishing dexterity: it separates the shells, and does not leave a single vestige of the animal within them.

In Brickell's History of North Carolina, we find a record of the wonderful sagacity of this animal. He says it is fond of crabs, and when in search of them takes its station by the side of a swamp, and hanging its tail over into the water, the crabs mistake it for food, and laying hold of it, the racoon soon perceives it pinching, pulls up its tail with a sudden jerk, and lands the crab on the soil, where it suddenly seizes it in its mouth and quickly devours it. He is careful, from experience, which way he seizes the crab, which he does transversely, to prevent the animal from inflicting wounds on his face by his nippers.

The Coati is another inhabitant of South America. It is an obstinate and capricious animal. Linnæus had one which he found very troublesome; it killed the poultry, tore off their heads, and sucked their blood. It defended itself with great force, whenever any person attempted to lay hold of it contrary to its inclination; and it stuck fast to the legs of those with whom it was familiar, when it wanted to ransack their pockets, and carry off any thing it found in them. It had an extreme aversion to hog's bristles, and consequently the smallest brush made it desist. Its mode of life was very singular: it slept from midnight to noon, kept awake the rest of the day, and uniformly walked about from six in the evening till midnight, without the least regard to the sort of weather. This is probably the time assigned by nature for procuring its food, which consists chiefly of young birds, eggs, and small animals.

The Badger.—This animal is furnished by nature with powerful means of defence; it is, however, nevertheless, of a most harmless and inoffensive disposition, and uses these means only when acting on the defensive, as it never attacks any other animal. Its food consists chiefly of roots, fruits, grass, insects, and frogs. It seldom appears abroad during day, but confines itself to its burrow, which it digs to a considerable depth under the ground, and for which purpose it is provided with strong nails.

There is no animal over whom man exercises more savage tyranny than the badger, for whenever one of these poor animals falls into his hands, it is subjected to a life of the most iniquitous torment, being baited by bulldogs and terriers, day after day, until its miserable existence is terminated by being literally torn to pieces. We can only wonder that there still exist men so totally devoid of reflection and humanity as to practise so cruel an amusement; and we are still more astonished that the laws should tolerate it in these enlightened days. Although the Almighty gave man dominion over the beasts of the field, it could never be expected he would exercise such unrelenting cruelty to one of the most harmless of creatures.

The following instance of faithful attachment in the badger was related by a gentleman who resided at the Chateau de Vernours, in France:—

Two persons on a journey, having occasion to pass through a hollow way, accompanied by a dog, he started a badger, and pursued it till it took shelter in a burrow under a tree, and from which it was at length hunted and killed. As they were only a few miles from the village of Chapellatiere, they agreed to drag the badger thither, so that they might receive the reward offered by the commune for every one which was killed, and, besides, to sell its skin to the manufacturer of badger-hair brushes. Having no rope, they twisted some twigs, and drew the animal along the road by turns. They had not proceeded far on their way when they heard the cry of an animal apparently in distress. They stopped to listen from whence it proceeded, when another badger approached them slowly. They at first threw stones at it, but this did not deter it from approaching its dead companion, which it no sooner reached than it began to lick, and made a mournful cry. The men observing this, desisted from offering it any farther offence, and continued to draw the dead body along as before. The faithful animal continued to follow the dead one, and

lying down on it, took it gently by the ear, and in this manner was actually dragged into the village; and even amid the crowd of boys and dogs which were soon collected around, it could not be induced to quit its situation; and, to their shame be it said, they had the inhumanity to kill this affectionate creature, and afterwards burn it, declaring that it could be no other than a witch.

The badger is an inhabitant of Britain, and the whole European continent; and Dr Richardson has identified various new species in his account of animals of the arctic regions.

The Wolverene or Glutton.—This quadruped is a native of Europe, and inhabits the northern parts of the Continent, as well as the colder regions of America. It resembles the wolf in size; the upper parts and the belly are of a reddish brown, and the sides are yellow and brown, with a band of the same colour crossing the back of the tail; the face is black, and the legs very strong and thick, short and black; the soles of the feet covered with hair.

The wolverene is a slow-paced animal, but possessed of a very great degree of sagacity, strength, and cunning. It burrows in the ground, and is said to be of a very fierce and savage disposition; but in this respect travellers and naturalists have wonderfully overrated it. Buffon, who quotes Alaus Magnus, one of the earliest writers who notice this animal, and who collected the popular notices of its habits, says, "The glutton, or wolverene, is the most noted of all the animals which inhabit the north of Sweden for its insatiable appetite, whence it has obtained the appellation of *jerf*, in the language of that country, of *wilfras* in German, and *rosomaka* in Scalvonian. It is wont, when it has found the carcase of some large beast, to eat until its belly is distended like a drum, when it rids itself of its load, by squeezing its body betwixt two trees growing close together, and, again returning to its repast, soon requires to have recourse to the same means of relief." Gmelin, however, treats this trait of its character as a fiction, as he had frequent means of ascertaining its true history, while travelling through Siberia, from information which he received from hunters. Departing from all these fictions, we turn to the account of Dr Richardson, whose authority is undoubted.

"The wolverene," says he, "is a carnivorous animal, which feeds chiefly upon the carcases of beasts that have been killed by accident. It has great strength, and annoys the natives by destroying their hoards of provisions, and demolishing their marten traps. It is so suspicious, that it will rarely enter a trap itself, but beginning behind, pulls it to pieces, scatters the logs of which it is built, and then carries off the bait. It feeds also on meadow mice, marmots, and other *rodentia*, and occasionally on disabled quadrupeds of a larger size. I have seen one chasing an American hare, which was at the time harassed by a snowy owl. It resembles the bear in its gait, and is not fleet; but it is very industrious, and no doubt feeds well, as it is generally fat. It is much abroad in the winter, and the track of its journey in a single night may be often traced for many miles. From the shortness of its legs, it makes its way through the loose snow with difficulty; but when it falls upon the beaten track of a marten-trapper, it will pursue it for a long way." Mr Graham says, "The wolverenes are extremely mischievous, and do more damage to the small fur trade than all the other rapacious animals conjointly. They will follow the marten-hunter's path round a line of traps extending forty, fifty, or sixty miles, and render the whole unserviceable, merely to come at the baits, which are generally the head of a partridge, or a bit of dried venison. They are not fond of the martens themselves, but never fail of tearing them to pieces, or of burying them in the snow by the side of the path, at a considerable distance from the trap. Drifts of snow often conceal the repositories thus made by the martens from the hunter, in which case they furnish a regale to the hungry fox, whose sagacious nostril guides him unerringly to the spot. Two or three foxes are often seen following the wolverene for this purpose."

Bingley mentions a surprising proof of the strength of this quadruped, which occurred at Churchill, on Hudson's Bay. One of these overset the greatest part of a pile of wood, which measured upwards of seventy yards round, and contained a whole winter's firing, to get at some provisions that had been hidden there by some of the servants of the Hudson's Bay Company, when going to the factory to spend the holidays. This animal had for many weeks been lurking about the neighbourhood of their tent, and had committed numerous depredations on the game caught in their traps and snares, as well as eaten many of the foxes that were killed by guns for the purpose. The people thought they had adopted the most effectual method to secure their provisions, by tying them up in bundles, and placing them on the top of the wood pile. They could not suppose the wolverene would ever have found out where they were, and much less that he could get at them if he did discover them. To their astonishment, however, when they returned they found the greater part of the pile thrown down, notwithstanding some of the trees with which it was constructed were as much as two men could carry. The wood was very much scattered about; and it was imagined, that, in the animal's attempting to carry off his booty, some of the small parcels of provisions had fallen down into the heart of the pile, and sooner than lose half his prize, he was at the trouble of doing this. The bags of flour, oatmeal, and peas, though of no use to him, he tore all to pieces, and scattered the contents about on the snow; but every bit of animal food, consisting of beef, pork, bacon, venison, salted geese, and partridges, in considerable quantities, he carried away.

LITERARY HISTORY OF THE BIBLE

ENGLISH VERSIONS.

It is probable that the inhabitants of Britain, who were first converted to Christianity by Saint Augustine, about the beginning of the seventh century, had some of the Scripture in their own language. About A. D. 709, Adelm translated the Psalms into English Saxon, and other parts of Scripture were translated by Eadfrid, a Saxon, about the same time. Bede, the first ecclesiastical English historian, who was born at Jarrow, on the banks of the Tyne, in 673, commonly denominated the Venerable Bede, made a translation of the Gospels, if not the whole Bible, into his native tongue. The whole Bible was translated into the Anglo-Saxon by order of King Alfred; and he himself, about A.D. 890, undertook a version of the Psalms, but died before it was completed. The next complete translation of the whole Bible, including the Apocryphal Books, was made by John Wickliffe into English from the Latin, and appeared between 1360 and 1380. This translation was written, but not printed; and great objections were made to it by the clergy; so that, in consequence of a decree of Arundel, Archbishop of Canterbury, many persons were committed to the flames for reading Wickliffe's translation of the Old and New Testament. The only portion of Wickliffe's version of the Scriptures which has ever appeared in *print* is the New Testament, published in 1731, by the Rev. John Lewis, minister of Margate, in Kent. This was reprinted several years ago, with a life of this earliest of English reformers, by the Rev. H. Baber, A. M., assistant librarian at the British Museum. For the gratification of our young readers, we shall transcribe the Lord's Prayer in Wickliffe's language, as a curious specimen of the orthography of the times in which this great reformer lived:—"Our Fadir that art in hevenys; halewid be thi name. Thi kyngdom come to, be thi wil done in erthe as in hevene. Give to us this day our breede ouir other substaunce. And forgiue to us our dettis as we forgiven to our dettouris. And lede us not into temptacioun, but delyvere us from yvel. Amen."

In the reign of Henry the Eighth, William Tyndale made one of the best English translations of the New Testament. It appeared in 1526, being the first that ever was *printed* in the English language. It was published at Hamburgh or Antwerp, and was dispersed at London and Oxford. Tonstal, Bishop of London, and Sir Thomas More, bought up almost the whole impression, and burnt it at St Paul's Cross. The venders were condemned by the Star Chamber to ride with their faces to the horses' tails, with papers on their heads, and with the copies they had dispersed tied about them, to the standard at Cheapside, where they were compelled to throw them in the fire. The price, however, enabled Tyndale to proceed, and, undismayed, he began to translate the Old Testament; for which he was at length seized in Flanders, and, having been strangled by the common hangman, his body was consumed to ashes.

Previous to the Reformation, in the time of Henry the Eighth, people were so little acquainted with the Scriptures, and so ignorant even in regard to the languages in which they were originally written, that the strangest assertions were made. Upon the appearance of the Scriptures in the Hebrew and Greek originals, some individuals exclaimed that "there was *now* a new language discovered called Greek, of which people should beware, since it was that which produced all *heresies;* that in this language was come forth a book called the *New Testament*, which was now in every body's hands, and was full of briars and thorns. And there had also another language now started up, which they called Hebrew, and that they who learnt it were termed Hebrews!"

When the Reformation in England first took place, efforts were made to promote the reading of the Scriptures among the common people. Among other devices for the purpose, the following curious one was adopted. Bonner, Bishop of London, caused six Bibles to be chained to certain convenient places in St Paul's Church, for all that were so well inclined to resort thither, together with a certain admonition to the readers, fastened upon the pillars to which the Bibles were chained, to this tenor:—"That whosoever came there to read should prepare himself to be edified, and made the better thereby; that he should bring with him discretion, honest intent, charity, reverence, and quiet behaviour; that there should no number meet together there as to make a multitude; that no such exposition be made thereupon but what is declared in the book itself; that it be not read with noise in time of divine service, or that any disputation or contention be used about it; that in case they continued their former misbehaviour, and refuse to comply with these directions, the king would be forced, against his will, to remove the occasion, and take the Bibles out of the church."

Soon after the death of Tyndale, John Rogers, afterwards martyr, finished the correction of Tyndale's translation of the Old Testament, and printed it at Hamburg, under the name of Thomas Matthews. Archbishop Cranmer and Miles Coverdale further corrected it. Cranmer got it printed by public authority in England, and King Henry ordered a copy of it to be set up in every church, to be read by every one that pleased; but, by advice of the Romish bishops, he soon after revoked this order, and prohibited the Bible. When Coverdale, Knox, Samson, Goodman, Gilby, Cole, and Whittingham, were exiles during the persecution in the reign of Mary, they framed another translation, with short notes, and got it printed at Geneva. It was much valued by the Puritans, and in about thirty years had as many editions. The bishops being displeased with it, made a new one of their own, which was read in the churches, while the Geneva translation was generally read in families. About 1583, Laurence Thomson published an English version of the New Testament, from the Latin translation, and annotations of the learned Genevan divine, Theodore Beza. In the end of the sixteenth and beginning of the seventeenth century, the English Catholics at Rheims published a version of the whole Bible, crowded with barbarous terms, and accompanied with notes calculated to support the doctrines of their church.

Of those who translated the Geneva Bible, as it is called, in the reign of Mary, besides Coverdale, we have their own and contemporary testimony, that they well understood the grace and propriety both of the Hebrew and Greek tongue. Amongst the good Hebrew scholars of this period, also, must be reckoned Bishop Alley, afterwards one of the translators of the Bishops' Bible, who was the author of a Hebrew grammar, and a person universally learned, especially in divinity and languages; as well as his fellow-labourer, Bishop Bentham, who, about the beginning of the reign of Edward the Sixth, is said to have addicted his mind entirely to the study of theology and the learning of the Hebrew language. To these may be added Bishop Davies, another of the translators of the Bishops' Bible, who, in the time of Mary, fled from this country, and, after his return in the following reign, served Wales, as well as England, with his assistance in translations of the Bible from the original into the languages of both countries.

The knowledge of Hebrew seems sometimes to have formed in those days a part even of female education for ladies of superior rank; and, accordingly, Paschali, in his translation of the Psalms from the Hebrew into Italian verse, dedicated it to Queen Elizabeth, as one who was well acquainted with the eastern tongues.

"Having entered upon the reign of Elizabeth, we soon behold," says Todd, in his Memoirs of Bryan Walton, "with grateful admiration, the goodly company of those who made the present version of our Bible in the reign of her successor. Of these, several, if they have been equalled, have not yet been excelled by any of their countrymen in oriental learning. With men of similar studies the kingdom then abounded. Nor could it well be otherwise, attention having been paid to the cultivation of such learning in public schools (particularly Merchant-Tailors' School), founded soon after the accession of Elizabeth, and the pursuit being greatly encouraged at both universities."

At the conference, which was held at Hampton Court, soon after the accession of James, for the settling of an ecclesiastical uniformity between the two countries of England and Scotland, the Puritans suggested unanswerable objections to the Bishops' Bible; and the king similarly objected to the Genevan translation. He therefore appointed fifty-four learned persons to translate the Scriptures anew into English, or, at least, compose a better translation, out of many. Seven of the fifty-four either died or declined the assigned task. *Forty-seven*, who remained, were ranged into six divisions, every individual of each division translating the portion assigned to the division, all of which translations were collated together; and when each company had determined on the construction of their part, it was proposed to the other divisions for general approbation. When they met together, one read the new version, whilst all the rest held in their hands either copies of the original, or some valuable version: when they observed any objectionable passage, the reader paused till they considered and agreed on it. They met at Oxford, Cambridge, and Westminster, beginning the work in 1607, and after the expiration of three years it was finished, and published in 1611. This Bible, which is now in use, must be pronounced an excellent work, remarkable for the general fidelity of its construction, as well as for the simplicity of its language. Dr Adam Clarke remarks, that "those who have compared most of the European translations with the original, have not scrupled to say, that *the English translation of the Bible*, made under the direction of King James the First, is the most accurate and faithful of the whole. Nor is this its only praise: the translators have seized the very *spirit* and *soul* of the original, and have expressed this almost every where with pathos and energy." It is still of public authority in the British dominions; and, next to the Dutch, is perhaps the best translation of the Bible extant.

It has been asserted by Mr Bellamy and some others, that the authors of our authorised translation *confined themselves to the Septuagint and the Vulgate,*

and did not translate from the Hebrew. This assertion, however, can be at once overthrown by bringing forward the authority of the fifty-four, or rather, as seven of them died before the translation was finished, of the forty-seven learned men, as may be seen by their no less modest than dignified preface, or address to the reader, inserted in the edition of the Bible, published in the year 1630, which has this satisfactory passage, among many others:—*If you ask what they had before them, truly it was the Hebrew text of the Old Testament—the Greek of the New.*"

Amongst these translators, two of the most noted for Hebrew erudition were Dr Adrian Saravia and Dr Richard Clerke. Dr Saravia, well known as a Hebrew critic, "was educated," says Mr Todd in his Life of Bryan Walton, "in all kinds of literature in his younger days, especially in several languages. He was the master of the celebrated oriental scholar, Nicholas Fuller, who gratefully mentions him in the preface to his Miscellanea Theologica; and he was one of those who had successfully answered an objection of the Puritans, which they revived in the Conference at Hampton Court, in regard to a verse in the old English version of the Psalms. Next to him in rank is Dr Richard Clerke, who thoroughly understood three languages, Latin, Greek, and Hebrew. Christ College, in Cambridge, of which he was a fellow, 'had a testimony of his learning in his Hebrew lectures; so had the university, in his disputations and sermons; so had the church, when his Majesty (James the First) called many to the work of the last translation of the English Bible; in which number he was, like one of the chief of David's worthies, not amongst the thirty, but amongst the first three.' To him and to Dr Saravia, it appears that the portion assigned was from the Pentateuch to the Book of Chronicles."

One of the best Hebrew scholars of that time was the celebrated English divine and theological writer, Hugh Broughton, who corresponded with a learned Rabbi at Constantinople, and used great exertions for the conversion of the Jews there to Christianity. Mr Broughton was in continual and most bitter controversy with the bishops, and was not employed, as he thought he should have been, in the translation of the Bible. At the time when our present version was made, he communicated many interpretations to the translators, which, as he afterwards complains, they "thrust into the margent;" and whoever compares the text of our version with the marginal readings, will be led to regret that our translators did not associate him with them; though, it must be confessed, he would not have proved a very agreeable fellow-labourer.

It must be observed, that in rendering the original text into English, there are certain words necessarily supplied by the translators, in order to make out the meaning. These supplementary words are printed in our Bibles in *italic* letters, to show that they are not in the original. The greatest of these supplements occurs in the 23d verse of the second chapter of the First Epistle of John, where the translators have supplied no fewer than *ten* words, in order to make out what they thought to be the proper meaning.

"From the mutability of language," says Evans, "the variation of customs, and the progress of knowledge, several passages in the Bible require to be newly translated, or to be materially corrected. Hence, in the present age, when Biblical literature has been assiduously cultivated, different parts of the sacred volume have been translated by able hands. The substituting a new translation of the Bible in the room of the one now in common use, has been much debated. Dr Knox, in his ingenious essays, together with others, argues against it; whilst Dr Newcome, the late Lord Primate of Ireland, the late Dr Geddes, of the Catholic persuasion, and the late Rev. Gilbert Wakefield, contended strenuously for it. Bishop Lowth and Professor Marsh have pointedly shown the necessity of bringing the text of the Scriptures, by the aid of ancient manuscripts and versions, as near as may be to perfection."*

Ainsworth, Doddridge, Macknight, Lowth, Blayney, and others, have published new translations of parts of the sacred books in English; and there is no doubt that many improvements might be made upon the present authorised version, particularly in the Old Testament. Dr Alexander Geddes, above mentioned, at his decease had proceeded as far as the *Psalms* in the translation of the Old Testament; but many of his variations from the common version are extremely injudicious. Archbishop Newcome and Mr Wakefield published entire translations of the New Testament; and an *improved version* of the New Testament, founded on Newcome, has been published by the Unitarians, accompanied with notes and an excellent introduction.

With the professed object of defeating the attacks on Christianity, a new translation of the Bible was given to the world, some years ago, by Mr J. Bellamy, of Gray's Inn Lane, London. This version is in many places so very literal in its translation as to be unintelligible, and, therefore, unfit for any good purpose. The writer's forced and erroneous interpretations, as well as his unjustifiable attacks upon other versions and translators, were so far from tending to the accomplishment of his professed object, that they seemed rather calculated to produce the opposite effect; and, consequently, his new translation, which made some noise in its day, was soon judiciously consigned to oblivion. And, upon the whole, it may be observed, that, although it is generally acknowledged, that, after the lapse of *two hundred and twenty years*, the improvements in critical learning, and the discoveries in the pursuits of knowledge, together with hundreds of manuscripts that have since emerged into the light, call for a revision of the present authorised version; yet such an attempt should not be rashly entered upon, and it should not take place until the necessity of it becomes much more apparent to common apprehensions than it is at present.

* Sketches of all Denominations, p. 135.

TRIP TO MARGATE.

The people of London and Westminster, in consequence of close application to business during great part of the year, require some recreation, by which the jaded mind may recover its elasticity. When the town gets thin of company, and their concerns may be confided to deputies, the Londoners believe nothing can be more refreshing than a trip to Margate, nothing more delightful than the entertainments there provided; and, accordingly, preparations are made for the excursion. What an agitation among the ladies! What a bustle among the gentlemen on the morning of departure! Steam-boats elegantly fitted up, and excellent in their accommodations, await the company at London Bridge, and at St Katherine's Dock. Down come coaches full of persons—porters laden with trunks, portmanteaus, boxes, bags, and all the visiting paraphernalia. Then come the joyous and solemn, the boisterous and the meek, young and old, with all the graduated appearances between sickness and health, from the sallow-faced youth who has just quitted the high stool in the back counting-house lighted by a gas lamp, to the smiling rosy-cheeked girl fresh from Hampstead Hill, and full of vivacity. All are handed along a temporary bridge, and over other vessels, to the Margate steam-boat, by the civilest seamen that ever trod a deck. Here is a man, with the daily papers, bustling among the passengers for purchasers; the men stowing away the luggage; and others getting the tackle ready to cast off. It is nine o'clock, and the bell is ringing to announce the departure of the vessel. There are a few more to come on board. What anxiety! What unnecessary exertion! What fear lest the boat should start without them! She swings out; there are more passengers expressing desire to come on board; a plank is laid, and they step safely on deck; the paddles move, the hawsers are let go, and off she swings.

The captain now takes his station on the paddle-box, directs the helmsman and the engineer through the Pool, or that part of the Thames most crowded with colliers. At some periods of the tide, this scene is deeply interesting—the forest of masts, small craft on their way deeply laden, others alongside ships receiving cargoes, ships of all descriptions, their topsails loosened, and colours flying, making their passage through the narrow channel to which the thick clusters of ships have contracted the river; the moving objects, the warehouses, the docks, the steeples of churches, and vessels decorated with the flags of their respective countries, form an assemblage surprising as magnificent. Those accustomed to the trip enjoy the astonishment betrayed by a novice. Every moment offers fresh scenery, and objects deserving to be seen. He stares and wonders, as if inquiring, can what he sees be real? The eyes of Argus would not suffice to take a glance at half that he would see, as he glides along. Among the curious objects near Rotherhithe church, is a raft with a shed erected on it, as a caution for ships not to anchor near. It is the spot beneath which has advanced the intended tunnel to connect the counties of Kent and Essex. Just beyond on the right is Deptford, remarkable for its extensive dock-yards. It was here Peter the Great of Russia worked as a shipwright, and displayed a truly noble desire to obtain useful knowledge. Farther on is the celebrated and magnificent Greenwich Hospital, once the residence of kings, now the retreat of seamen who have been wounded in the service of their country. This superb edifice extends its terrace 875 feet along the banks of the Thames. No one who contributes his mite can pass this building without feeling a national pride; indeed, there is a general expression of satisfaction on board. The band, as the steam-boat glides past, strikes up the air "Rule Britannia," and officers of the navy and others touch their hats in unaffected respect. A little farther, winding round the Isle of Dogs, on the opposite shore, is Blackwall, where is the chief entrance to the West India Docks, and just beyond are the East India Docks.

The river here becomes clearer of impediments, and steam-boats put on their force equal to fourteen or sixteen miles an hour. On the right, Woolwich and its arsenal, its dock-yards and lofty buildings, under which ships of the line are constructed—anchors, cannon, pyramids of balls, and other marine stores, are crowded along the shore. There are the hulks, or old ships of war, converted into prisons for convicts, who, during the term of their punishment, clear the river of sand-banks, and raise ballast; many parties may be seen at their laborious employ. Views into the county of Kent now open, and many villas, delightfully placed on rising grounds, now meet the eye, surrounded by wooded hills and cultivated vales. On the left, the shores of Essex present a series of low pasture grounds and herds of cattle, with here and there a glance at a distant cultivated upland. The wonder-exciting objects being behind, and elbow-room obtained, many having gone below to breakfast, the politician cons over the morning paper. Old codgers remark on the state of the funds and the leading features of commercial policy, while the younger persons contemplate the enjoyments which Margate has in store, giving occasional glances at the picturesque scenery on the Kentish coast—the lawn and foliage surrounding Belvidere House; the ivy-covered tower of Erith Church, near which is the spot where the dispute between King John and his barons was appointed to be settled, afterwards concluded at Runnymede. On the opposite side is the village of Purfleet, near which is a depôt for gunpowder; it covers a great extent in many detached buildings. The cliffs at this spot are strikingly picturesque and beautiful, presenting the most irregular surfaces of chalk in various elevations, and in a summer's sun a great variety of hues. This part of the Thames is called Long Reach. Here large ships may anchor in six or seven fathoms water. The village of Greenhithe is seen on the right; it was once of ecclesiastical importance. Near it is a beautiful villa called Ingress, with its lawns and stately trees approaching to the water's edge; it formerly belonged to the nuns of Dartford. A little farther is the village of Northfleet, with its numerous limekilns. Just beyond this, on the opposite or Essex shore, is the spot where Queen Elizabeth encamped her forces during the threatened invasion by the Spanish Armada, with its consecrated banner, in 1588; the defeat of which occasioned the printing of the first newspaper in Britain; it was called "The English Mercury," dated July 23, 1588; a copy is preserved in the British Museum. In 1293, the charge by passage-boat from this place to London was one halfpenny each person. It is now, by steam-boat, two shillings; by sailing-boats, one shilling.

Here the scenery on either side is as remarkable for ancient circumstances as for modern improvements—Tilbury Fort on the left, and the town of Gravesend on the right. This is the entrance to the port of London. Although thirty miles distant, here all the arrivals and departures of shipping are noticed. To this there are many steam-boats and sailing vessels daily. Gravesend is an admired spot during the summer months. It has its bathing establishments, and all the amusements of a watering-place on a diminutive scale. Tilbury Fort presents a formidable range of 106 pieces of cannon commanding the Thames, which is here a mile in width. The fort was built by Henry the Eighth, in consequence of the Dutch fleet having sailed up the Medway, and burnt several ships at Chatham. It is near Gravesend that the Emperor Claudius is supposed to have crossed the Thames when pursuing the Britons; and a little north of Tilbury Fort, four Roman pro-consular ways crossed each other. In 630, it was the see of Bishop Ceadda or St Chad, who converted the East Saxons. It is now a deserted spot. Further on is Canvey Island, containing nearly three thousand acres of marshy land; its shores are covered for a considerable distance with empty cockle-shells, and have been so from time immemorial. Near this point is the little town of Leigh, near which is an erection called the Crow Stone; it marks the eastern termination of the conservatorial jurisdiction of the city of London, the western being at Stains, in Middlesex, an extent of about sixty miles.

The Thames widens here considerably, and appearances of getting out to sea appal the fresh-water gentry. The ailing and the robust look about with an increasing desire to learn some particulars concerning the weather. Although contrary to directions, they will inquire of the steersman. He tells them the wind is freshening; that it is squally, and likely to come on to blow, at which faces lengthen considerably. Hereabout the captain collects the passage-money; he is attended by a seaman with a box for the voluntary contributions of the company. It is usual to drop sixpence in acknowledgment of the great attention of the crew. The band also pay their respects to the passengers, and are satisfied with a trifle. Many persons retreat to the cabin and amuse themselves with chess or draughts. Several of the fair sex who will keep the deck, begin to feel uneasy, and look as if they were becoming more fair. Sips of weak brandy and water are recommended, without any good result. They are advised not to look on the rolling foam; to keep near the middle of the boat, as

the action there is felt less. Oh! it is all in vain; it is disagreeable any where. What shall they do? it is so strange that others should feel no such symptoms. Indeed, they are very poorly. They get worse —are pitied; but getting shockingly bad, they are carried below to the ladies' cabin.

God bless me, some of the old gentlemen will say, what an uncertain climate ours is! The morning was most beautiful, and see how the noon has turned out. I see we shall have a rough passage. Well, we must make the best of it. I never like to see the gulls thus making up the river; 'tis a sign of blowing weather. The younger and the timid gentlemen whisper to each other. They inquire of the seamen, who are busy stowing all tight, if the wind is likely to blow very hard. They are told, very likely it will be freshish about the Nore, for they will have a head-sea. Can't set any canvass to keep her steady. Is there any danger? they inquire; and, without waiting for an answer, anticipate a storm, perhaps a wreck, and silently wish themselves on shore: yet, with a screwed-up mouth and melancholy visage, they endeavour to put the best face possible on the affair. The steam-boat begins to feel an increasing resistance, and plunges over or through the waves, which dash up the bows, and scatter the spray into the steersman's face. The gents cannot stand this; they go, or are assisted down the companion. Those who are tough, keep the deck in their rough-weather cloaks, giving an occasional gaze to windward. Among these are some, whose desire to be thought knowing has hoodwinked their judgment. There—It is gone! exclaims one of these gentry. What a phiz does he exhibit! It may be depicted thus: Make a circle; put a dot in the centre for the nose, put two dots above for the eyes, and a large blot before for the mouth, and it will give the expression of a Cockney who has lost his hat at sea. Yonder it dances in the wake of the steam-boat. He ties a silk handkerchief round his head, and crawls below to brood over his misfortune. Those who keep the deck converse on the various objects as they pass —of the increasing attractions of Southend, a beautiful watering-place on the Essex coast—of the Isle of Grain, on the coast of Kent—of the Nore, or estuary of the Thames and Medway, on which spot a vessel is constantly moored, hoisting nightly a powerful light for the guidance of mariners. The current is said to run stronger here than at any other place on the coast. Off the mouth of the Medway, ships of war are often riding at anchor, and in fine weather the steam-boats from the Continent along the Kentish coast, steam-boats and colliers from the northward, with all sail set, pleasure-boats, fishing-boats, and barges, with their tan-coloured sails, present to the voyager the most delightful marine scenery imaginable. Sheerness may be seen up the Medway, and the impregnable lines at Chatham. The Isle of Sheppy next appears, on which the sea has at times made sad havoc, carrying away acres of soil, with dwellings upon them. Here, a few years since, a vessel of large dimensions was found imbedded in the sand. From its antique construction and agreement with historical account, it was one of those in which the Danes visited our shores. On rounding the Isle of Sheppy, Whitstable appears on the adjacent coast; pyritiæ is picked up, from which copperas is manufactured. There is also at this place a fishery for oysters, of good quality, and in request at the London markets. Onwards is Herne Bay, where is a watering-place with a newly-constructed pier. This spot is rising in public estimation, from the good accommodation afforded to its visitors. Farther on may be seen the Reculvers, two steeples used as a sea-mark. Off this place are several dangerous sand-banks, called the Flats, but not in any way connected with those who pass near them on the trip to Margate. Reculvers was the Regulbium of the Romans and the Raculf of the Saxons. The original spires were erected by an abbess of Faversham in the dark ages.

The coast of Kent exhibits many highlands, on which the Britons lighted fires to give notice of the coming of the predatory Danes. It is supposed Reculvers occupies the site of a Roman fort, as coins of Cæsar, Honorius, and Tiberius, have been found there. The Romans gave to this province, which included the Isle of Thanet, the name of Cantium, and its people were called Cantii. Reculvers afterwards became a palace in which the Saxon monarchs resided. Ethelbert kept his court here after his conversion to Christianity by St Augustine. The heroism of the people, in past times, is yet held in remembrance by the inhabitants of this part of the coast. They are "men of Kent," to distinguish them from the inhabitants of the inland parts of the county, who are "Kentish men." The Cockney's heart cheers up on learning he is off the Reculvers, as the high buildings of Margate may be seen. He has taken his early dinner, or his lunch, if he could eat; he certainly has had some brandy and water, and can venture to take a peep. Ay! there is Birchington, only four miles more. The shirt-collar is pulled up, the wristbands are pulled down, the fingers passed through the cultivated tufts, the hat is cocked a little on one side, and he is prepared to enact his part. The ladies, who have been long invisible, now begin to peep out like stars in a summer evening, one after another, till the deck presents a galaxy of brightness. All prepare to deliver the payment check, and look after their luggage. Some are particularly anxious that a certain bandbox should not be crushed.

It is low water. "Ease her, stop her," are the cries. The steam-boat is at the jetty, on which, during the periods of embarking and disembarking, no persons are allowed to come except the porters. They are ticketed, and so attentive to the orders given them, that an act of dishonesty or of neglect is unknown. Although no one may appear on the jetty from the town, the passengers have to pass between assembled thousands of quizzers on either side. If the miserable passer can look up and discover a friend among the crowd, they nod or shake hands. "Ha! how do? What a rough passage you have had! We have been looking out for you. How well you look!" winking at a companion; "I declare you are quite a sailor." This, and more, will be let off at a being whose appearance is that of a corpse. Still, a good face is put on all that occurs, and the air of one wholly unaffected by sea-sickness is assumed, while the mind and the stomach are in a state of the utmost confusion. Yet all is, or soon will be right. The smile and gaiety of heart will be resumed, and to-morrow be ready to play off the same badinage on their friends who may come by the next day's steam-boat.

It is but justice to state, that the accommodations on board these steam-boats are good, the attention to passengers every thing that could be wished, and the charges are moderate. In fine weather, the passage from London to Margate has been made in five hours and a quarter.

SCOTTISH WATERING PLACES.

INNERLEITHEN.

INNERLEITHEN has for some years been one of the best-frequented watering places in the southern part of Scotland, and, though still a small village, is rising in population. It is pleasantly situated in the vale of Tweed, in Peeblesshire, at the distance of twenty-eight miles south from Edinburgh, and six east from Peebles, by which the road from Edinburgh proceeds. It stands on a flat piece of ground within a quarter of a mile of the left bank of the Tweed, environed on the east and west by high and partly wooded hills. The Leithen water proceeding out of the vale on the north, passes through the village to the Tweed, and is crossed by a stone bridge carrying along the road from Peebles to Selkirk. By far the greater part of the houses stand on the right bank of the Leithen, on the property of the Earl of Traquair, who has feued the ground on advantageous terms. The lands east from the Leithen form part of the estate of Pirn. For many ages the village, or rather hamlet, of Innerleithen, was among the smallest and most primitive of this pastoral and thinly peopled district, consisting of little else than a few thatched houses near the Leithen, and a mill, with the church of the parish, situated a short way up the vale. Placed in a secluded part of Scotland, and out of the way of general traffic, it seemed to have every chance of remaining for a long time in obscurity. While in this condition, during the last century it was pitched upon as being well suited for being a seat of woollen manufactures, chiefly in consideration of its site in the midst of an extensive pastoral county, and upon the brink of a rapid running brook, which offered a powerful fall of water. That which may have been observed by different individuals was seen with greater clearness by a native of the district, who had risen to great wealth by a course of successful industry in London. This patriotic person was a Mr Alexander Brodie, who was by profession a blacksmith, and had originally gone to the British metropolis in search of employment, having at the time only a few shillings in his pocket. In the course of a number of years, by great skill in his business, this person realized a very large fortune. Many years before his death, about the year 1790, he bethought himself of raising the consequence of Innerleithen, by the establishment of a woollen factory, which was forthwith erected at a considerable expense, L.3000 being expended on the works and machinery. This manufactory, which is a house of five storeys, attracted a number of settlers to the village, and scattered a good deal of money in the vicinity, but till this day its success has been very limited, and various lessees have lost capital by carrying it on. The cloth produced is mostly blue, and of a homely quality.

While the village acquired a more comfortable aspect under the influence of its cloth factory, it gradually became known for the possession of a salubrious mineral spring, held to be of great virtue in scorbutic and other affections. We understand that it was not till about the beginning of the present century that this spring attracted particular notice. After it did acquire its character as a spa, it continued to be only administered from a simple pump to those country people who trusted in its healing properties. Little more than ten years ago, if not less, "Innerleithen well," in a strangely sudden and unaccountable manner, acquired a very high degree of reputation among real or imaginary valetudinarians, all over the south of Scotland, and especially in Edinburgh. The old primitive pump was disused, and an elegant structure being reared over the spring, by the late Earl of Traquair, the place was made to vie with some of the long established watering places in England. Its celebrity was farther enhanced in 1824, by the publication of the novel, by the Author of Waverley, entitled St Ronan's Well, of which place it was fondly imagined to be the prototype. This part of the vale of Tweed being simultaneously or previously opened up by the running of stage-coaches from Edinburgh to Peebles, and of conveyances from thence to Innerleithen, there was now no hinderance to visitors, and the consequence has been, that every year since, the number of lodgers in the summer and autumn months has been on the increase. Much of this popularity has been owing to the proximity of the village to Edinburgh, and the ease with which it can be reached, in which peculiarities it is superior to Pitcaithley, Moffat, Dumblane, and other watering places. There are also various advantages connected with its locality which will not be overlooked. It is a fit place of temporary residence for those fond of angling, as, besides the Tweed and the Leithen, it is near the Quair, and at no great distance from St Mary's Loch, in Yarrow, as well as other trouting waters. The climate is allowed to be dry and healthy, and the country is here so primitive, that there is no disagreeable interruption in making extensive promenades.

To accommodate the numerous transient residents, a number of substantial houses have been built, forming a neat small street along the public road, with a variety of houses behind, which are let as private furnished lodgings. The village has now two public inns, one of which is provided with a ball-room or large dining apartment, some good shops, and a circulating library. Newspapers are taken in at the pump-room. At one of the shops, fishing-tackle is sold and lent to anglers on moderate terms. During the season, the enjoyments of the visitor are promoted by concerts, balls, public readings, parties to St Mary's Loch, shooting parties to Elibank and Horsburgh Wood, as well as by the exhibitions of a party of strolling players, &c. The trustees of the roads in this quarter of Tweeddale have been very assiduous in improving the thoroughfares near Innerleithen. A new road has been formed towards the head of the vale of Heriot, by which, as soon as the Mid-Lothian part is finished, a ready communication will be had with Mid and East Lothian, and the districts producing coal and lime. Fully as beneficial and a much more beautiful improvement has been instituted in the erection of a handsome wooden bridge across the Tweed to Traquair, by which strangers have now an opportunity of visiting the classic shades of the "bush aboon Traquair," and the scenery on the right bank of the Tweed. The bridge is erected on strong piers in the water, and permits the passage of horses and carriages, a convenience of great moment as regards intercourse by carts to the head of the Yarrow, the fords being often impassable for days at a time.

The visitors who take an interest in the prosperity of the village, along with the regular inhabitants, have recently instituted an association, styled the *St Ronan's Border Club*, which is composed of a great number of gentlemen connected with all parts of the country, under whose auspices is held an annual festival, for the exhibition of Olympic games or gymnastic exercises. Under the patronage of this body, there is also a competition in trout-fishing for one day in the year; the person who catches, by the rod, the greatest aggregate weight of fish, being rewarded with a medal. The day of competition is usually the Edinburgh fast-day in May. The competitors in and patrons of these pastimes always dine together, and close the day in convivialities, which are frequently enlivened by the presence of men eminent in different walks of literature.

The parochial district of Innerleithen is chiefly the basin of the Leithen Water and the small burns poured into it. This mountain-stream originates in the north-western corner of the parish, and, after a course of about twelve miles, falls into the Tweed nearly opposite Traquair house, the seat of the Earl of Traquair. The word *Leithen* is significant of a water which overflows its banks. Improvements on a great scale have been made in the district exposed to the Tweed, especially on the estate of Glenormiston, which now shows some fine plantations. Westward from thence, near the road to Peebles, and on a rising ground overhanging the Tweed, stands Horsburgh Castle, now entirely in ruins. It was anciently the seat of the Horsburghs, and was used as one of the numerous peel-houses on the Tweed. From it a pleasing view is obtained of the town of Peebles further up the Tweed, and Nidpath Castle beyond. It is mentioned that a natural son of Malcolm the Fourth was drowned in a pool near the foot of the Leithen, and that the first night after his decease his body was deposited in the parish church. Hence King Malcolm, in granting the church to the monks of Kelso, "*in qua*," says he, "*prima nocte, corpus filii mei post obitum suum quievit*," ordained that it should have the power of giving a sanctuary to those fleeing from justice, "*quantum habet Wedale* aut Tyningham.*" In 1232, the church was confirmed to the monks, by their diocesan, William, the bishop of Glasgow. While the church, with its vicarage and rectorial property, continued with these churchmen the village of Innerleithen, with the circumjacent district, continued a part of the royal demesne, during the reign of Alexander the Second.

The small hamlet and mill of Traquair stand op-

* Wedale is the ancient name of the vale of Gala; the church above alluded to was at Stow.

posite Innerleithen, at the opening of the vale of the Quair, upon the plain of the Tweed. At a short distance south-west from thence, at the base of a hill, with an eastern exposure, is seen all that remains of the famed "Bush aboon Traquair," consisting of a few meagre birch trees, the melancholy remnant of a considerable thicket, once the seat of pastoral love, and as such consecrated in the strains of one of our best national melodies. It is likely that in a short time even these memorials will be entirely gone. At the head of a lawn fronting the Tweed, and surrounded by some trees and ornamented grounds, stands the ancient house of Traquair, the seat of the earls of that title. It consists of a tower of remote antiquity, to which considerable additions were made in the reign of Charles the First, by John Earl of Traquair, Lord High Treasurer of Scotland under that monarch. The interior is partly in an old fashioned, and partly in a refined modern taste, with a small chapel (the family being Roman Catholic), in the upper flat. At the back, or south front, there is an old avenue leading to the house, exhibiting at its outer extremity a gateway ornamented with figures in stone of the bear, the cognisance of the family. The first of the house of Traquair was James Stewart, the illegitimate son of James Earl of Buchan, who obtained a legitimation under the great seal, and, in 1491, a grant of the lands of Traquair from his father. The fifth in the line of descent from this James was Sir John Stewart, the above renovator of Traquair house, who was made treasurer by Charles the First, and raised to the peerage by the title of Lord Traquair in 1628. In the year 1631, his lordship was elevated to the title of Earl of Traquair, Lord Linton and Caberstoun. This nobleman, who was a distinguished statesman in his time, died in extreme poverty in 1659, having suffered greatly by his adherence to the cause of fallen royalty. Luckily his lordship was not attainted, and he bequeathed the earldom and estates to his descendants, who still enjoy them.

ORIGINAL OF MEG DODS.

The above account of Innerleithen is chiefly the same as that given by the editors of this journal in their joint work, the Gazetteer of Scotland. It may be proper to take this opportunity of adding some information respecting the original of Meg Dods—the leading grotesque character in the novel of St Ronan's Well—who will naturally be inquired after, both in a visit to Innerleithen and in reading an account of it. Meg Dods was unquestionably a somewhat exaggerated delineation of Miss Ritchie, who for many years kept the head inn at Peebles, in which, like Mrs Margaret, she had succeeded her father. The inn was an old building, situated in the Northgate of that town, and entered through an old-fashioned court-yard, like some of the auberges of the Continent. It had originally been the town-house of the family of Williamson of Cardrona—the last of whom, by the way, was one of the best specimens in his day of the old kind of Scotch lairds, and furnished Mr Hogg, of Ettrick, with the notion of his droll song, the Drunken Laird o' Lamington. The characteristic features of Miss Ritchie were so nearly the same as those described in Meg Dods, that it is not easy, without a repetition of these, to say any thing respecting her. She was more of a gentlewoman than Meg, being very well-connected, considering her position in life. Her abilities were also of no mean order. The great leading point of resemblance between the fiction and the reality was that tone of independence, approaching even to rudeness, which is ascribed to Meg even in her days of greatest adversity. Miss Ritchie, though invariably civil when treated with due respect, had that *out-spoken* way with her, that she could never conceal her real sentiments when either provoked, or, as she thought, injured. She was not at all the sort of person to resent an insult only by an overcharge, and patiently put the broken leg of a waiter into the bill. She rather appeared as the obliging than as the obliged party in all her transactions, and if any indulgence or comfort was expected in her house, it was necessary, in the first place, to use all soothing terms of speech. No doubt, much of this arose from natural character; yet it was also fostered, in a great measure, by the circumstances in which she was placed. Previous to 1808, when a good hotel, of the modern fashion, was erected in Peebles by the gentlemen of the county, she reigned without a rival; and as there was no tolerable house within perhaps twenty miles of her in all directions, it is easy to conceive that travellers must have felt some little deference to their hostess to be quite indispensable. When the hotel was set up, she growled like a lioness deprived of her whelps. Yet she would not give in. She was too old to learn new tricks of civility, and too independent in her circumstances to require to put them in practice. Accordingly, when any one came to her house who, she learned, was in the habit of going to the hotel, she never hesitated to break out upon him in a tide of indignation and sarcasm, which was not always very easily borne. Sometimes she would absolutely refuse, at first, to send to such individuals the liquors or refreshments which were wanted. In short, the setting up of the hotel was, to her, exactly what the erection of the new well and its inn was to the acrid mistress of the Cleikum.

One instance of the *manner* of mine hostess of the Northgate may be acceptable. In the year 1810, a detachment of French officers came to reside at Peebles as prisoners on parole; and a party of about twenty called, immediately on their arrival, to take dinner at Miss Ritchie's. They were speedily set down to a large preparation of ordinary barley-broth, which, on tasting, they declared to be "*bon bon.*" Miss Ritchie, overhearing this expression, immediately burst out with—"*Banes!* d'ye say there's banes in *my* kail? Get out o' my house, ye hallanshaker-looking scoondrels! Gae wa back wi' ye to Pennycuick, and see what ye'll get there. They're ower gude for you, or ony like you. Banes in my kail! My certy!" And it was not without some difficulty that the hostess and her guests were brought to a right understanding, and the unfortunate gentlemen permitted to proceed with their dinner.

BIOGRAPHIC SKETCHES.

ALEXANDER RITCHIE,

Sculptor.

[Much interest having been excited by the rise of this meritorious young artist amongst us, we have exerted ourselves to procure an account of him for publication, both that we may aid a little in his professional advancement, and that our readers may be gratified with so amiable a picture of talent exerted under disadvantageous circumstances, and finally triumphing over its principal difficulties.]

ALEXANDER RITCHIE was born at Musselburgh, 15th April 1804, and he received his education at the grammar school there, which has always been an academy of by no means limited reputation. He had for his school-fellows many who distinguished themselves in the different walks of life they afterwards pursued. Amongst those we may mention the names of Lieut. Drummond, now private secretary to Lord Althorp; David Mylne, M.A. and F.R.S.E., author of the Essay on Comets, which gained Dr Fellowes's prize in the University of Edinburgh; David M. Moir, author of Mansie Waugh, and of many admired poems; Henry Carmichael, A.M., who gained the principal prize in the University of St Andrews for the year 1816. While at school, Mr Ritchie made little progress in languages, his taste, as afterwards evinced, taking quite a different turn. His schoolbooks, from the earliest period at which he was enabled to handle a pencil, showed the particular bent of his mind in attempts to delineate the objects around him. His brother, Walter, having been sent to receive instructions in drawing from one Beaumont, a painter, who had taken up his residence in the town, our young artist—at that time only eight years of age—at his own earnest entreaty, was allowed to accompany his brother to receive a few lessons, for an hour every alternate day. This opportunity, however favourable it might have proved to his future prospects in life, was destined very soon to be lost. He was only allowed to remain six weeks, during which time, however, he contrived to surpass his elder brother, who had the benefit of former study and longer instruction.

One forenoon, his father, who follows the trade of an ornamental house plasterer, having gone on business to the country, his son Walter, at that time an apprentice, had contrived to get Alexander, then about nine years of age, into the workshop, and there challenged him to model a leaf, both agreeing that their father should be umpire of their respective merits. His uncle, happening to call in as the work was finished, immediately gave his judgment in favour of our artist; and to an eager inquiry of the boy, if he really thought so, replied, "Gang to your father, and see if he can mak' a better."

Straggling remarks and cursory hints, from individuals who saw and appreciated his taste for drawing, were all the instructions he afterwards received in that branch of study, except what he derived from his own application. But perseverance overcomes all obstacles. While the rest of the family were in bed, our young artist was enthusiastically pursuing his studies; and when paper was not to be had, the walls of his sleeping room were resorted to for the prosecution of his favourite art. At the age of fourteen, having finished the ordinary branches of education, he was employed occasionally in assisting his father in the more ornamental branches of his profession; and chance with him, as with many other sons of genius, was the means of laying the foundation of his future advancement. His father happening to call at the house of a friend in Edinburgh—Mr Black, now architectural inspector to Heriot's Hospital—saw a copy of Bell's Anatomy of Expression lying on his table, and mentioning his son's predilection for drawing, begged the loan of it for his use for a few days. On returning it, Mr Ritchie, at Mr Black's request, brought one or two of his son's drawings along with it. These Mr Black admired so much for the skill and taste displayed in them, that he took the opportunity of submitting them to the inspection of Mr Leonard Horner, afterwards President of the London University, mentioning at the time that he pointed out their beauties, the self-taught powers of the artist.

Mr Ritchie then came to town at the desire of Mr Horner, and brought with him a few drawings, models in basso relievo of a laughing child, a Jew's head, and a dog. Mr Horner expressed his high satisfaction at the progress of the boy-artist, and asked him whether he preferred painting or sculpture, as he seemed fully competent to prosecute either. This was an easy matter for young Ritchie, who immediately decided in favour of the latter; and his warm-hearted patron entered on his plans for his future advancement.

Mr Joseph, the distinguished sculptor, who was then prosecuting the art in Edinburgh, was applied to by Mr Horner in behalf of his young protegé, and at that gentleman's request Mr Ritchie was sent for, his drawings and models were examined, and arrangements made for two years' study under his immediate eye. In 1823, Mr Joseph, having occasion to go to London to forward the modelling of busts of some of our distinguished public characters, carried Mr Ritchie along with him, on account of the proficiency he had already made, and the assistance he might be able to render him. On his return to Edinburgh, his term of apprenticeship being then finished, at the earnest suggestion of Mr Horner he commenced modelling on his own account, and to encourage him in this the most trying period of his life, procured for him several orders for busts.

Through the interest of his patron, he then entered the Trustees' Academy to finish his studies in drawing, and, during the vacation, was advised by him to go to London to study the Elgin marbles. On his return in the autumn of 1826, business thickened on him, and he got orders for busts of the present Solicitor-General, Lord Hermand, Professor Bell, Sir John Hope, and others.

The Earl of Minto, Count Flahault, and some other gentlemen, about this time visited the studio of Mr Ritchie, in company with Mr Horner, and after an examination of his models and busts, being much struck with them, and interested in the artist, they determined to advance his future views in life, by enabling him to proceed to Italy, where he might study the works of the most celebrated masters.

In June 1826, Mr Ritchie accordingly left Edinburgh for London, and having visited Paris, where he remained a few weeks, passed on to Carraia, where he stopped for four months. Here he commenced his first essay in marble chiselling, which was a copy of the bust of the Apollo Belvidere.* Some English residents there, having heard of the arrival of a young Scotch artist, paid him a visit, and, on seeing what he was engaged in, they good humouredly ridiculed the idea of one so uninitiated in the art of sculpture making such a bold attempt. He explained his reasons, however, and begged them to withhold their opinion for a season, until the work was farther advanced. His future success plainly evinced that the confidence he placed in his own powers was far from being ill-judged.

About Christmas 1826, he passed on to Rome, according to arrangements made before leaving Edinburgh. By the Earl of Minto he was introduced to the Duke of Hamilton, then residing in that city, and was engaged by his Grace to execute a bust in marble of his daughter, Lady Susan Hamilton, and through his Grace's interest, in concert with Lord Minto, he was entered a pupil of the illustrious Thorwaldsen. His statue of the Apollo Belvidere, brought up from Carraia (which as yet was but roughly sketched), was then shown to his great preceptor, who expressed his entire satisfaction with his progress. When finished, many tempting offers were made to him for its disposal; but his gratitude to his first patron overcame them all, and it was forwarded to Scotland, as the best evidence that Mr Horner's kind interest in his fortunes had not been misplaced.

Mr Hallam, the learned author of the History of the Middle Ages of Europe, having visited the studio of Thorwaldsen, enthusiastically admired the Ganymede of that celebrated artist, and asked his permission for Mr Ritchie to make a copy of that work. This, his third attempt, was finished to the entire satisfaction of his employer, no mean criterion of the powers of our artist, considering the critical acumen of that learned individual. It also met with the warm approbation of Thorwaldsen, who perceived beauties in it which, during the seven times it had been previously copied, had been entirely overlooked.

He then made a copy of the Mercury of Thorwaldsen, for Sir John Hope, Bart., which was forwarded to Scotland.

Having finished a model for a marble bust of Joseph Hume, M. P., whilst on his visit to Edinburgh in 1826, he got orders to execute the same; as also a bust of Lady M'Donald Lockhart, by orders of that lady, then residing in Rome.

On finishing these, the time of his probation in Italy drawing near to a close, he set off for the purpose of visiting Leghorn, and returned by Florence, where he employed his time in visiting the celebrated works of art in that city. He then set out for Paris, to examine the Louvre, and returned by London to Edinburgh, which he reached in the autumn of 1830.

Immediately on reaching home, Mr Ritchie commenced modelling some of the designs which he had sketched out in his mind as fit subjects for classical grouping. In 1831, he began his great work, Olindo and Sophronia at the Stake, which, on finishing, he offered to the Scottish Academy for their exhibition of that season; but not being able to come to satisfactory arrangements about a central place for it in their large room, the only point where it could be seen to advantage, he determined on retaining it for the Glasgow exhibition of that year, where it accordingly appeared, along with Telemachus, and some others, and called forth the warm admiration of the Dilletanti So-

* It is necessary to inform our young readers that this is deemed one of the finest specimens of ancient sculpture in existence.

ciety of that city. While in Glasgow, he executed several busts of private individuals.

In 1832, he sent in to the Royal Institution his Mercury, and the busts of Lady Susan Hamilton, Lady Hope, D. M. Moir, and others, and to the Scottish Academy, of the same year, his statue of a Shepherd Boy, and his Sleeping Child, now the property of Sir Archd. Campbell of Succoth. In the early part of this year, he had commenced his colossal statue of Sir William Wallace, on which he expended much of his time and labour; and the accuracy with which the several parts are formed, the exquisite anatomical modelling of the arms, and the mechanism of the knee-joints, are proofs of the great care and attention bestowed on the minutiæ of this great work. His Kneeling Cupid, and most of his designs in terra cotta, were finished this year; and several persons of taste, more especially his unwearied adviser Mr Moir, who had early taken a deep interest in the fortunes of the sculptor, now earnestly recommended an exhibition of his works. This has been done; and the great interest which it has excited among the lovers of the fine arts in Edinburgh, is the best proof that the advice given him was founded upon a just estimate of his merits.

Scotland has been blamed, and perhaps not unjustly, for her neglect of native genius; but better things are now to be hoped from her, and we trust that in this instance she will prove the fallacy of such a charge. Sculpture, from its rare excellence, and the undeniable circumstance of a classical taste being absolutely requisite to appreciate its beauties, necessarily limits the numbers of its admirers far within those of its twin-sister Painting; but we hope so many are yet left to us, sufficiently qualified to appreciate its higher excellencies, as may enable us to retain at home an artist of so much promise, and, we may add, performance, as Mr Ritchie.

TWO DAYS IN THE RIDING-SCHOOL.*

THE first morning after a young officer has joined his regiment, he finds himself exalted on a spirited steed, some sixteen hands high, from whose back he dares not cast the eye downward, to take even a glimpse of the immense space between him and the earth. His chin is so elevated by a leather stock, that he can just see the head and ears of the animal on which he sits; his heels are screwed out by the iron fist of the rough-rider; and the small of his back is well bent in. Having been knocked and hammered into this posture, the word "march" is given. This command the well-drilled animal obeys immediately, and the machine is suddenly set in motion, the result of which usually is, that the young gentleman speedily finds his way to the ground, with the loss of half a yard of skin from his shin, or with his nose grubbing in the earth.

"Well done, sir; Astley himself could not have done better. Mount again, sir; these things will happen in the best-regulated riding-academies; and, in the army, sir, you will have many ups and downs. Come, sir, jump up, and don't be down-hearted because you are floored."

"Well, serjeant, but I am very seriously hurt."

"Nay, nay, I hope not, sir; but you must be more cautious for the future."

The pupil mounts again, and the order is again given to march, and off goes the horse a second time, the serjeant roaring out at intervals—"Well done, sir! Head a little higher—toes in, sir—heels out—bend the small of the back a little more—that will do, sir—you look as majestic as the Black Prince in the Tower, or King Charles's statue at Charing-Cross. Bravo, sir—rode capitally! We will now try a little trot. Recollect, sir, to keep your nag well in hand,—*trot*.

"Well done, indeed, sir—knees a little lower down, if you please—that's higher, sir—no, no, sir, that's higher, I say—you look for all the world like a tailor on his shopboard. What are your elbows doing up there, sir? Elbows close to your body—you pay no attention to what I say, sir—*faster, faster*."

"Oh dear! oh dear; oh dear! Serjeant, halt; I shall be off! I shall be off! oh dear, oh dear!"

"Bravo, sir, that's better—*faster*."

"Serjeant! I am sick, serjeant!"

"Never mind such trifles, sir; riding is an excellent remedy for all kinds of sickness. Now, recollect, in changing from one to two, you round the horse's croup well, by applying your right leg to his flank, and take care he does not kick you off.—*Change from one to two.*

"Halt, sir; halt! that won't do: what the devil are you about? That's the wrong way; I told you from one to two: turn your horse about from one to two."

"I can only just see the top of the riding-school—I can see no figures at all, serjeant."

"Well, sir, we'll dispense with this for the present: but soldiers should learn to turn their eyes every where. Suppose we have another march, sir. *March—trot—faster—faster*; very well, indeed. Now, sir, you must recollect, when I say the word *halt*, that you pull your horse smartly up, by throwing your body well back, and pressing the calves (if any) of your legs to his side. If you don't keep your body upright, the horse's head will soon put it in its proper place. Faster—a little faster—*halt*. There, sir, I told you what would be the consequence of your not keeping your head properly up!"

"Stop, stop; my nose bleeds, my nose bleeds!"

"Rough-rider, get a bucket of water for the gentleman. You had better dismount, sir."

"Dismount, serjeant? How am I to get off this great beast?"

"Why, jump, sir, to be sure—jump off Come, sir, we cannot wait all day; you delay the whole drill. Come, come, sir, dismount!"

"Put your hand on the horse's rump, and lay fast hold of his mane," cries a young officer, who had just surmounted the same difficulties, "and you will soon be off." The tyro in riding follows this friendly advice, and finds himself neatly floored by a tremendous plunge of the horse, thus finishing his first day's drill.

The next morning the pupil attends the riding-school, with his nose somewhat embellished by his fall. He enters the school with his—"Good morning, serjeant;" for it is always good policy to keep friends with both riding-masters and rough-riders. "Good morning, sir," says the serjeant; "I hope you did not hurt yourself yesterday."

"Oh, no—oh, no! Mere scratch—mere scratch—not worth mentioning."

"Glad to hear it, sir. We must expect in the army both scratches and falls. I have ordered you, for to-day, a horse somewhat more spirited, that will jump under you like an antelope."

"Much obliged to you, indeed," says the pupil, making a tremendous wry face.

"Oh, don't mention the obligation, sir. It is my duty to make a good rider of you, and I flatter myself that I have turned out some of the best riders from this school that are to be found in the kingdom, and with as few accidents as could reasonably have been expected; though, of course, casualties will sometimes inevitably happen, in a large academy like this. To be sure," continues the serjeant, winking at the rest of the party assembled, "there was poor Cornet Shins, who broke his neck, and, by the bye, off the very horse you are going to ride to-day; but that, of course, was no fault of the poor animal's. Then, there was Lieutenant Stew, who broke his thigh, and a few other trifling circumstances of this kind, which make good for the army."

"Good for the army! How do you make that out?"

"Why, sir, it is as plain as the eighteen manœuvres. We will just suppose, for the sake of argument, that your neck is broken this morning."

"My good serjeant, what are you talking about?"

"I am only *supposing*, you understand, that your neck was broken; in which case it must be clear to you that you would make room for another. But come, sir, we must proceed to business! Prepare to mount—*mount*—steady there—not an eye or muscle to move—pray, sir, keep your horse steady—put your left leg to him, and put him straight—don't touch him in the flank, sir, or he will soon have you off—that will do—*march*—sit still, I beg, sir; you are all on one side, like the lug-sail of a boat—that's better; now, sir, *trot—faster—halt*. Pray, sir, do be attentive."

"My stirrups are too long."

"Rough-rider, take them off; the gentleman will ride better without them. Now, sir, off with you again—*march—faster—halt*. Why, sir, you roll about like a ship in distress; pray keep your seat—*march*."

"I am off, I am off!"

"Not yet, sir."

"Yes I am, yes I am."

"Well, I believe you are now, sir; at least I never saw any thing more like it in my life. I hope you are not hurt, sir."

"No, not much; but this horse is worse than the other."

"Why, of course, I know that, sir; you must have a worse horse every day. Come, sir, mount again."

"I can't; you have taken the stirrups off."

"Oh, never mind that, sir; jump up."

"I can't."

"Try, sir; there is no remedy. Yonder I see the riding-master coming this way."

The riding-master now comes up, and inquires into the progress of all his pupils.

"Well, serjeant, how gets on Cornet Waddle?"

"Very well, indeed, sir; he has only had two falls in two days."

"I am glad to hear it. What horse is that he is on?"

"Kicking Billy, sir."

"Ah! a good horse to learn on. Heads up, Cornet Waddle—six inches from hand to hand—four inches from holster-pipes—that will do—*trot*. Bless me, Cornet White, how your elbows go; one would imagine you had been either a tailor or a fiddler. Do keep them close to your sides, sir. We'll now try a little canter—*canter*. Very well indeed—change from three to four. Cornet Shanks, pray keep those stretching legs of your's quiet, and feel the horse's mouth lightly. Not with that hand, sir, but with the bridle. Keep down your knees—*faster—halt*. What, three of you off! Come, mount again, gentlemen; when I was a recruit, I fell fifty times a-day, and laughed at the fun. Now, hold on—*march—trot—gallop*. Cornet Waddle, let go the horse's mane; let go, sir."

"I can't sir; if I do, I shall be off."

"You must go faster, then, till you do—*faster—faster*; well done, indeed—*halt*. What, off again!"

Thus concludes the second day's drill; after which the pupil, having surmounted the minor difficulties of horsemanship, is put into a squad of about a dozen recruits, to act in a body.

* This most amusing and cleverly written sketch is from "Memoirs of the Extraordinary Military Career of John Shipp, late a Lieutenant in the 87th Regiment. Written by Himself." Three vols. 12mo.

AN EASTERN STORY.

MANY of our readers will remember the story in the Arabian Nights' Entertainments, in which a good Mahommedan who went upon a journey lost his money by having deposited it in a pot of olives, which he placed in the custody of a merchant till he should return. A story, somewhat similar, though a little more humorous, is told by Fuller in his amusing "Narrative of a Tour through some parts of the Turkish Empire,"* and which he mentions he heard from a friend in Aleppo: he entitles it

THE JEW OF HAMAH.

Once upon a time there lived in Hamah a certain Turk called Mustapha, who having accumulated some wealth by carrying on a trade in goat's hair, determined to make a pilgrimage to Mecca. His family consisted of his wife and two slaves; and as the lady insisted on not being left behind, the good man resolved to sell off his stock of goat's hair, to take all his household with him, and to shut up his house till his return. The only difficulty that presented itself was what to do with his money. He did not like to run the risk of being robbed of it in his journey through the Desert, he did not like to leave it in an empty house, and there were not any of his friends to whom he wished to trust the secret of his wealth. After much deliberation, he placed it in separate parcels at the bottom of five large earthen jars, which he then filled up with butter, and on his departure sent them to the house of one of his neighbours, a Jew named Mousa, to keep till his return, telling him that it was a stock which he had laid in for winter consumption. The Jew, however, from the weight of the jars and other circumstances, suspected that they contained something more valuable; and as soon as Mustapha was fairly on his way to Damascus to join the caravan, he ventured to open them; when finding his expectations realized, he took out the gold, and filled them up again with butter so carefully, that nobody could tell that they had been disturbed. The poor Turk, on his return from the pilgrimage, soon found out the trick that his neighbour had practised upon him; but as the jars were exactly in the same apparent state as when he left them, and as there was no evidence as to their contents, it was plain that no legal process could give him any redress. He therefore set about to devise some other way of punishing the Jew, and of recovering, if possible, his property; and in the mean time he did not communicate his loss to any person but his wife and enjoined on her the strictest secrecy.

After long consideration a plan suggested itself. In one of his visits to the neighbouring town of Homs, where he was in the habit of going to sell his goat's hair to the manufacturers of the mashlakhs, for which that place is famous, he fell in with a troop of gypsies, who had with them an ape of extraordinary sagacity. He prevailed on them to sell him this animal; and, conveying it privately to his house at Hamah, shut it up in a room to which no one but himself had access. He then went to the bazar, and bought one of the dark scanty robes and the small caps, with a speckled handkerchief tied closely round it, which is the prescribed costume of the Jews throughout the Turkish empire. This dress he took care invariably to put on whenever he went to visit his ape; and as he always carried him his meals, and indeed never allowed any other person to see him, the animal in the course of a few weeks became extremely attached to him, jumping on his neck, and hugging and caressing him as soon as he entered the room.

About this time, as he was walking along the streets one day he met a lad, the son of the Jew Mousa, and, having enticed him into his house by the promise of some figs, he shut him up a close prisoner in a detached apartment in his garden, at such a distance from the street and from the other houses in the town that the boy could not discover to any one the place of his confinement. The Jew, after several days' search, not being able to obtain any tidings of him, concluded that he had either been drowned, or had strayed out of the town, and fallen into the hands of some wandering Bedouins; and as he was his only child, fell into a state of the greatest despair: till at length he heard by accident, that just about the time that the boy was missing, he had been seen walking in company with Hadgi Mustapha. The truth instantly flashed on his mind, and he recognised in the loss of his son some stratagem which the Turk had planned in revenge for the affair of the butter-jars. He immediately summoned him before the Cadi, accused him of having the boy in his possession, and insisted on his immediately restoring him. Mustapha at first strenuously denied the fact; but when one of the witnesses positively declared that he saw the boy go into

* Murray. London, 1830.

his house, and when the Cadi was about to pronounce his decree, that he should bring him into court dead or alive, he exclaimed, "There is no God but Allah, and his power is infinite; he can work miracles when it seemeth good in his sight. It is true," continued he, addressing himself to the Cadi, "that I saw the Jew Mousa's son passing by my house; and, for the sake of the old friendship subsisting between his father and myself, I invited him to come in and to eat some figs which I had just been gathering. The boy, however, repaid my hospitality with rudeness and abuse: nay, he even blasphemed the name of our holy prophet; but scarcely had the words passed his lips, when, to my surprise and horror, he was suddenly changed into a monkey. In that form I will produce him: and as a proof that what I tell you is true, you will see that he will immediately recognise his father."

At this instant a servant, who was waiting on the outside, let loose the ape into the divan, who, seeing that the Jew was the only person present in the dress to which he was accustomed, mistook him for his master, jumped upon him, and clung round his neck with all the expressions of fondness which the child might have been supposed to exhibit on being restored to his parent. Nothing more was wanting to convince the audience of the truth of Mustapha's story: "A miracle, a real miracle!" they cried out; "great is Allah, and Mahomet is his prophet;" and the Jew was ordered to take the monkey, and retire from the court. A compromise was now his only resource; and, accordingly, as soon as it was dark, and he could go unobserved, he repaired to Mustapha's house, and offered, if he would liberate his son, to restore all the money which he had taken from the butter-jars. The Turk, having attained his object, consented to release his prisoner; but, in order to keep up his own credit, he stipulated that the child should be removed privately, and that the father with his whole family should immediately quit the place. The popular belief in the miracle thus remained unshaken; and so great was the disrepute into which the Jews fell in consequence of this adventure, that they all departed one after the other, and none have ever since been known to reside in Hamah.

A PERILOUS SITUATION.

Captain Crow, in his Memoirs, relates the following perilous adventure:—"One afternoon, when we were ten to twelve hundred miles from any land, and were sailing at the rate of seven or eight knots, the alarm was given that the ship was on fire in the afterhold. I was in the cabin at the time, and springing upon deck, the first persons I saw were two young men with their flannel shirts blazing on their backs; at the same time I perceived a dense cloud of smoke issuing from below; and looking round me, I found the people in the act of cutting away the stern and quarter boats, that they might abandon the vessel. At this critical juncture I had the presence of mind to exclaim, in an animated tone, "Is it possible, my lads, that you can desert me at a moment when it is your bounden duty, as men, to assist me?" And, observing them hesitate, I added, "Follow me, my brave fellows! and we shall soon save the ship." These few words had the desired effect, for they immediately rallied, and came forward to assist me. To show them a proper example, I was the first man to venture below, for I thought of the poor blacks entrusted to my care, and who could not be saved in the boats, and I was determined, rather than desert them, to extinguish the fire, or to perish in the attempt. When we got below, we found the fire blazing with great fury on the starboard side, and as it was known to the crew that there were forty-five barrels of gunpowder in the magazine, within about three feet only of the fire, it required every possible encouragement on my part to lead them on to extinguish the rapidly increasing flames. When I first saw the extent of the conflagration, and thought of its proximity to the powder, a thrill of despair ran through my whole frame; but by a strong mental effort I suppressed my disheartening feelings, and only thought of active exertion, unconnected with the thought of imminent danger. We paused for a moment, struggling, as it were, to determine how to proceed. Very fortunately for us our spare sails were stowed close at hand. These were dragged out, and, by extraordinary activity, we succeeded in throwing them over the flames, which they so far checked, that we gained time to throw a good supply of water down the hatchway, and in the course of ten or fifteen minutes, we extinguished the flames. Had I hesitated only a few minutes on deck, or had I not spoken encouragingly to the people, no exertions whatever could have saved the ship from being blown up, and as the catastrophe would most probably have taken place before the hands could have left the side in the boats, perhaps not a soul would have survived to tell the tale. I hope, therefore, I shall be excused in assuming to myself more credit (if indeed credit be due) for the presence of mind by which I was actuated on this occasion, than for any thing I ever did in the course of my life. The accident I found was occasioned by the ignorance and carelessness of the two young men whose clothes I had seen burning on their backs; through the want of regular officers, they had been entrusted to draw off some rum from a store cask, and who, not knowing the danger to which they exposed themselves and the ship, had taken down a lighted candle, a spark from which had ignited the spirit.

A GLIMPSE OF CALEDONIA FROM THE EQUATOR.

"Oh! what can sanctify the joys of home,
Like hope's gay glance from ocean's troubled foam."—BYRON.

Adieu! ye southern climes, adieu!
My heart is full, but not of you:
My heart o'erflows—I've cross'd the line
That sever'd me from all that's mine;
I've reach'd the long-wish'd mountain brow,*
And, looking down on all below,
Methinks afar, in fancy's eye,
My fatherland I can descry.

Methinks the gay green isle I view,
Like emerald set in ocean blue;
Its chalky cliffs, and heath-clad hills,
Romantic lakes, and rambling rills,
Its sunny slopes, and woody dells,
Where love with peace and virtue dwells;
Where nought is heard the hills among,
Save shepherd's pipe and milkmaid's song.

Methinks I catch a distant view
Of that sweet spot, where first I drew
The breath of life—that long-lov'd scene,
The village school, the village green,
My father's grave, my mother's cot,
The pastimes of my little lot,
My playday haunts, my playmates too—
Alas! now scatter'd far, and few!

Ah, little then 'twas dreamt that I
Should e'er to foreign regions hie;
That I should e'er be doom'd to greet
The men that dwelt beneath our feet—
Th' Antipodes, said not to fall,
Though standing 'neath earth's rolling ball—
A prodigy then strange to me,
Confounding young philosophy.

But, lo! a brighter scene I view,
Majestically breaking through
The murky clouds, that vainly try
To shroud its glories from the eye.
It is Edina's cloud-capt head—
It is the sheen of beauty shed
Around her sacred seat—it is
The city of proud palaces.

Yonder's the castle-crested rock,
That oft hath brav'd the battle's shock;
And yonder's Arthur's lofty seat,
Uprais'd amidst his wild retreat;
And there the crag romantic stands,
But rescu'd now from Gothic hands;
And there's the Calton's placid brow,
Adorn'd with classic beauty now.

And there's the royal Holyrood,
Still weeping in her widowhood—
Her royal lord and princes dead,
And all her highborn neighbours fled—
Her spacious parks and mountain rocks,
Now brows'd by vulgar herds and flocks,
Though erst the scenes of noble glee,
And games of gallant chivalry.

But still Edina rears her head,
Though all those stirring times have
Her monumental columns proud,
Her sacred domes and spires, that crowd
On fancy's vision, rising high,
Devoutly pointing to the sky,
As if to show mankind the road
That leads to glory and to God.

And brighter far than e'er she shone
Before her prince and peers were gone,
I see her spreading far and wide,
Moving in more than princely pride;
Advancing south, with comely grace,
She'll soon the blithesome Braid embrace;
And, walking gaily to the north,
She soon will kiss the gallant Forth.

"The gallant Forth!"—Oh tell me why
Thou hast so late met Fancy's eye?—
But, gallant Forth! though I no more
May stroll along thy gay green shore,
Nor climb the rock thy waters lave,
Nor skip across thy crystal wave,
Yet thou art dearer now to me
Than e'en the scenes of infancy.

For there, upon thy happy strand,
Before I left my fatherland,
I bask'd in life's meridian sun,
And there those sacred friendships won,
For which my longing bosom sighs—
Those silken cords, those tender ties,
That link the soul where'er we roam,
And draw the weary wanderer home.

And still the village church I see,
With many a face well known to me,
Where oft I sat in days of old,
And heard the man of God unfold,
With fervid tone and reverend look,
The mysteries of the Holy Book,
And proffer to a needy race
The riches of redeeming grace.

And still the modest manse I view—
Another little temple too—
Where God is worshipp'd, loved, and known,
And hath on every heart a throne,
Where all is peace, and joy, and love,
An emblem of the life above,
To mortals lent, as if to show
A specimen of heaven below.

Is this a thing of life I spy,
Or is it but a phantasy?
Alas, the dark blue sea, the play
Of dolphins dashing through the spray.
The southern cross, the clouds,† the sky,
And all that meets the ranging eye,
In bitter accents, seem to say,
"Thy home is yet far, far away!"

Then blow, ye gentle trade-winds, blow,
And waft me swiftly o'er the flow
Of wide Atlantic's swelling wave,
Whose perils now I gladly brave
That I may see, in vision true,
What but appears to fancy's view;
That I my home and friends may see,
In all their dear reality.

Once more, ye southern climes, adieu!
My heart is full, but not of you;
My heart o'erflows—I've pass'd the line
That sever'd me from all that's mine;
My heart is panting to renew
The long-lost joys of friendship true;
My heart is bounding o'er the sea,
To reach the home that's dear to me.

Mediterranean Packet, lat. 0° 56′ N. long. 33° W.

* We used to say, at the commencement of our voyage, that when we reached the equator, we should feel as if we had reached the top of the hill, and we should then go down the north side of the mountain apace.

† The Magellan clouds, two whitish spots near the milky way in the southern hemisphere.

JUNE.

SPRING may now be considered as employed in completing her toilet, and, for the first weeks of this month, putting on those last-finishing touches which an accomplished beauty never trusts to any hand but her own. In the woods and groves, also, she is still clothing some of her noblest and proudest attendants with their new annual attire. The oak until now has been nearly bare, and, of whatever age, has been looking old all the winter and spring, on account of its crumpled branches and wrinkled rind. Now, of whatever age, it looks young, in virtue of its new green, lighter than all the rest of the grove. Now, also, the stately walnut (standing singly or in pairs in the forecourt of ancient manor-houses, or in the home corner of the pretty parklike paddock at the back of some modern Italian villa, whose white dome it saw rise beneath it the other day) puts forth its smooth leaves slowly.

Stepping forth into the open fields, what a bright pageant of summer beauty is spread out before us! Everywhere about our feet flocks of wild-flowers

"Do paint the meadow with delight."

We must not stay to pluck and particularize them; for most of them have already had their greeting—let us pass along beside this flourishing hedge-row. The first novelty of the season that greets us here is perhaps the sweetest, the freshest, and the fairest of all, and the only one that could supply an adequate substitute for the hawthorn bloom which it has superseded. Need the eglantine be named? the "sweet-leaved eglantine;" the "rain-scented eglantine;" eglantine—to which the sun himself pays homage, by "counting his dewy rosary" on it every morning.

The woodbine deserves to be held next in favour during this month, though more on account of its *intellectual* than its personal beauty. All the air is faint with its rich sweetness, and the delicate breath of its lovely rival is lost in the luscious odours which it exhales.

These are the only *scented* wild-flowers that we shall now meet with in any profusion; for though the violet may still be found by looking for, its breath has lost much of its spring power. But, if we are content with mere beauty, this month is perhaps more profuse of it than any other, even in that department of nature which we are now examining—namely, the fields and woods.

The patches of purple or of white clover that intervene here and there, and are now in flower, offer striking exceptions to the above, and at the same time load the air with their sweetness. Nothing can be more rich and beautiful in its effect on a distant prospect at this season, than a great patch of purple clover lying apparently motionless on a sunny upland, encompassed by a whole sea of green corn, waving and shifting about it at every breath that blows.—*Mirror of the Months.*

The readers of the Journal are respectfully informed that a fortnightly sheet, similar in appearance and price to that work, is published under the title of "CHAMBERS'S INFORMATION FOR THE PEOPLE," of which the following seven numbers have already appeared:—

1. EMIGRATION TO CANADA, being a complete body of information on that country for the use of Emigrants, and precluding, in a great measure, the necessity of consulting other works.
2. HISTORY OF THE ISLAND OF GREAT BRITAIN, down to the commencement of the Civil War—to be continued. The object of this sheet is to afford such a view of British History as may be suitable to the tastes and opportunities of the people at large.
3. HISTORY OF MANKIND—a view of the progress of the Human Race, and of the peculiarities of the various divisions of Mankind.
4. EMIGRATION TO NOVA SCOTIA, NEW BRUNSWICK, CAPE BRETON, &c.
5. EMIGRATION TO THE UNITED STATES.
6. ACCOUNT OF THE GLOBE—a complete view of the internal and external Structure of the Globe, comprising all the discoveries of modern geologists.
7. THE COTTON, WOOLLEN, SILK, AND LINEN MANUFACTURES—a condensed account of the progress and present state of those essential branches of our national industry.

Articles are also in preparation on a variety of subjects generally interesting to the people, and will in due course appear. The design of the work approximates to that of Constable's Miscellany, and the several series which have been started upon the same plan, but, from the extreme lowness of the price, proposes to be much more extensively useful. Every article is a *careful original composition*, generally the production of the Editors themselves, or of some other literary gentlemen of established character in the departments respectively assigned to them. In Edinburgh, as in the case of the Journal, it is regularly left every alternate Wednesday at the houses of subscribers, and it may be had of every bookseller and newsman throughout the United Kingdom.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 71. SATURDAY, JUNE 8, 1833. PRICE THREE HALFPENCE.

MEN ABOUT TOWN.

In every large city, there are a few single gentlemen who move about among what is called the best society, and are every where received as men of proper style and character, who, nevertheless, have no real pretensions to the honours they receive, and are in fact mere adventurers. If a young man have only such an income as will supply him with a little pocket-money, and be possessed of agreeable manners and a prepossessing exterior, let him but get into a single coterie in a fashionable city, and he immediately makes his way through the whole, and may live for years afterwards as a guest at the tables of the great. The grand essential for this kind of life, is to have nothing known about one. Just be a well-dressed and well-bred stranger; and if you are seen at one place, you are asked to another, whence you are asked to a third, and so on to a fourth, no one ever thinking further about you than simply that you are the young man whom we saw at such a place, and who took out Miss Young to dance. Fortunately for those who choose to live in this manner, there are always multitudes of silly women, the wives of men of good income, who, in their anxiety to show off and advance themselves in society, are perpetually giving parties, to which no one is invited on the sacred principles of friendship and hospitality, but multitudes are drawn in to eat and drink for considerations altogether different—chiefly that they may be impressed with a respectful notion of the giver of the entertainment. Such shows might almost be considered as given for the especial benefit of the individuals alluded to, who can always manage to get invitations to them, and are the only individuals to whom such exhibitions of viands and liquor do any real good.

The individual who writes the present paper was once "so far left to himself" as to spend several months amidst the heartless frivolities which characterise a winter of fashionable life in the Scottish, as in all other capitals. In the course of the season, he had opportunities of observing the tactics of many young men about town, as they are called, some of whom were occasionally put to serious difficulties in the purchase of a single pair of white kid gloves, though they appeared, in company, as perfectly accustomed to the luxury of a full purse as if they had never known the reverse. There was one in particular in whom I had much reason to be interested, as will be observed from the adventure I am about to relate. This was a Mr Hopper, an Englishman of between thirty and forty, who had been fluttering about town for nearly a dozen years, as I was informed, and yet no one knew any more about him than just that he was Mr Hopper. Hopper was a polished and most agreeable man, and, having seen much of the world, possessed really considerable powers of entertainment, insomuch that, at the dullest and worst-assorted parties, a relief was experienced from his conversation. He was supposed to be *out* four times a-week at an average, throughout the season; and though no instance of his giving a treat in return was upon record, many of these invitations were to the same house. There was even a worse peculiarity in Hopper, which, in many persons, would have had a very unfavourable effect, but, in his case, seemed to be pardoned for the sake of his better properties. This was his coarse and uncultivated-looking appetite. While all others were eating with the deliberation proper to good society, and talking as much as possible between every bite, Hopper devoured his victuals with a rapidity and a silence alike odious, and never brought out a remark worth listening to till his mouth was quite disengaged from what he seemed to think a more serious business. In fact, Hopper was universally cried out upon as a gormandiser.

The adventure just alluded to was a dinner which Hopper once gave to *me*—he who had never given a dinner or any thing else before, and who was supposed by all who knew him to be incapable of giving dinners. An entertainment that took place under such remarkable circumstances, may well be expected to excite some curiosity in the reader, and I shall therefore describe it in the most minute and faithful manner possible.

What it was that inspired Hopper with the desire of having me to dine with him, I never could exactly make out. Perhaps it was a vague report, to which I gave no credit myself, that I was about to be married to a great heiress then in vogue:—possibly he might reckon upon an invitation, at no distant date, to —— Hall, in return for his own. Whatever was the motive, one thing is certain:—it could only be from some hope of turning the affair to his own advantage. At first, I must confess, I was rather startled by the event. I saw that he was a mere man about town, and wished to have as little to do with him as possible. On second thoughts, however, I resolved to go just to see what kind of dinner such a man would give.

During the interval between the invitation and the appointed day, I found myself completely possessed by speculations on this latter point. What kind of dinner, thought I, is to be expected from a man who never gave a dinner before? Will it be good, or bad, or simply indifferent? I tried it all the ways, but at last fairly made up my mind to this:—that, when the man was making a plunge, as it is called, he would do it to some purpose. The dinner would be splendid, even although there should be nobody there but myself.

Accordingly, on the evening of the great day, I moved towards the lodgings of Mr Hopper, in the full hope, like the dog invited by his friend to sup, of regaling myself at one of the most exquisite banquets that the world had ever produced. I had that day refused lunch at three places, that my appetite might be in proper order for so rich a treat; and, having walked a good deal without any refection since breakfast, it may be guessed that I was considerably disposed to do justice to whatever should be set before me. On arriving at my friend's lodgings, which were, for the time, in a rather shabby cottage near Newhaven, I was informed by him, that, from some misunderstanding with his landlady, dinner would not yet be ready for half an hour, and he proposed that we should while away the time by a walk on the beach. To this I agreed, and, by so doing, gave the last fine edge to an appetite already almost as keen as a razor. However, thought I, there can be no doing too much justice to such an entertainment. In the course of our walk, the conversation somehow turned upon desserts. He was a great critic, I found, in this branch of gastronomical knowledge. He had eaten all kinds of desserts, in all quarters of the world, and, said he in conclusion, "I have got into such a habit of devouring these fine things, that I never dine, even by myself, without something of the kind." Well, thought I, this is better promise still—the dinner, to be sure, is something long a-coming; but when it does come, what will it not be?

At length, in a perfect agony of appetite, I was led back to his lodgings, where we found, in the first place, a very neatly spread table, but as yet no viands. Neither was there any wine as yet visible above the horizon. After a little farther conversation, Hopper went to a cupboard, and brought out a black bottle, which he placed very carefully near his own plate. By and bye, the honest woman of the house brought in a small covered dish, which proved to be of curried mutton-chops, with another containing boiled rice. This gave, of course, a revolution to my expectations, and informed me, that, after all, it was to be only a bachelor's, or, to describe it more emphatically, a lodging-house dinner. However, I still thought there might be a rough sufficiency in the affair. In this, alas, how much was I deceived! The cover being removed from the chops, disclosed three small pieces about as many inches square, piled above each other, and a small quantity of sauce floating at the bottom. "Now," said Mr Hopper, "here are curried chops to begin with—the best dish in the world: will you be helped to any?" Though I thought the question rather superfluous, I answered in the affirmative, and was served with the least of the three pieces, scrupulously selected by my entertainer—without any sauce—after which I observed him, to my infinite consternation, turn over all that remained, sauce included, into his own plate, along with a large proportion of the rice. He then helped me to one spoonful of the latter dish, and desiring me to make a hearty dinner, fell to in his usual *absorbed* manner, never taking his eye off his plate till it was empty. The two bites which I found upon my piece of chop were of course soon dispatched, and I was then left to survey the proceedings of my entertainer, who, to do him justice, did not keep me long waiting. Having finished his own part of the first course, he pulled a bottle of common beer, and having helped himself to a full tumbler, which he immediately drunk off, poured out half a tumbler for me, and then emptied the remainder into his own glass, to stand as a stock for himself. The landlady now brought in a dish of fricasseed chops, consisting, like the former, of three small pieces; and having, in like manner, ascertained that I was disposed to eat of this meat also, handed me the *least* of the trio; after which, as before, he turned over the whole into his own plate, and soon became as abstracted as ever in the great business of devouring. He awoke at last, some time after I had finished my second pair of bites, to ask me to take a glass of wine. I held out my glass, and received it back about two-thirds full of port, which he poured from the black bottle above alluded to. He then filled his own, and drank it off; then filled one more, and drank that off; and once more again, and drank that off too; and then—and then—it was evident the bottle was empty. The landlady now appeared, to ask if any more chops were required, to which he answered in a direct negative, without seeming to think it in the least necessary that *I* should be consulted in the matter. Of course, I had to abandon myself to my fate. Dinner was over.

My entertainer now talked of liquors. "What kind of wines do you like?" said he, naming Champagne, Burgundy, Hochheimer, and many others, with as much confidence as if he had had specimens of them all in his cellar. I spared the man—though he did not deserve it—if, indeed, it could be supposed that such a person would have been at a loss to parry whatever request had been made to him. I said, that, when dining in this quiet kind of way, I generally preferred a little spirits and water to any kind of wine. "Oh, very well," said he, catching me like wildfire, "I can give you the best whisky in the world—a most particular article—the king never knew of it, I believe—got it sent me last August from the Highlands by my friend ——, member, by the bye, for ——shire, which is rather too bad"—here he put his finger on the side of his nose; "but

all the better for that, you know." A solitary bottle of whisky was accordingly brought out from the cupboard (I could swear it had no companion), and we began to liquidate part of it into punch. By way of giving him a fright, I made a large and strong tumbler, the effect of which was seen within the first quarter of an hour, in his beginning to talk of his inordinate propensity to tea and coffee. "Do you know," said he, "I am a most extravagant dog in tea and coffee. I keep all kinds of tea, and, indeed, chiefly live upon it when I am alone. Sometimes in summer I can take no dinner at all, but just have a cup of tea and a biscuit. I am fond of green—oh, I do dout upon green. It is the best tea in the world. For common use, however, bohea is a respectable tea. I like bohea very well, I must say. It is less of a drug, and cheers fully as much. Oh, you cannot think what a tea-drinker I am!" By and bye, observing that I was less severe upon the whisky than he expected, he dropped the conversation about tea and coffee; and, on a servant coming in and laying down a cup on a side-table, motioned it away, as if he had felt it to be a mal-apropos idea. I soon after relieved him from all farther anxiety about either tea or toddy, by taking my leave, alleging that the illness of a friend who lived with me made it necessary that I should be soon home. I could see, from his suddenly warmed manner, that he had never till now truly enjoyed my company. His parting expressions were the most cordial of the whole evening.

As I afterwards crawled to a tavern, to satisfy my hunger by a real dinner, I could not help deploring that a man of Hopper's talents and accomplishments should prefer living such a life, when, by sinking a little, and applying himself to honest industry, he might render himself much more truly respectable, and, I should suppose, much more truly happy. The life of this man, thought I, is a perpetual insincerity: it is a visionary show from first to last. And what is gained by such a departure from reality?—only an equivocal kind of countenance from persons almost as hollow and deceptious as himself, and a somewhat larger share of certain indulgences, which, however, are the most paltry and the most transient on earth.

POPULAR INFORMATION ON SCIENCE.

ANIMAL MAGNETISM.

Now see the various wonders as they pass,
The Cowpox, *Tractors*, Galvanism, and Gas.—Byron.

It happens that Byron has here sneered at four scientific discoveries in their first blush, which afterwards have been established (at least three of them) as among the most valuable that ever were developed for the service of mankind. In the word "tractors" he refers to what is called animal magnetism, a scientific wonder, which, though practised on the Continent for upwards of fifty years, and hinted at by many medical writers during the last three centuries, is almost entirely unknown in this country. Within the last few weeks, a book of great research and reflection has been published on this subject, under the title which is noted below;* and as it seems, notwithstanding its exceeding great interest, to be exciting little attention, we shall endeavour, as far as is in our power, to obtain, both for the volume and its subject, the notice which they so eminently deserve.

Animal magnetism—an incorrect but convenient phrase—refers to a power which a stronger is supposed to be able to exert over a weaker person, or a healthy over a diseased, whereby, through a mere exertion of the will in some cases, but more generally by this means accompanied by stroking with the hands, the former throws the latter into a state of sleep, during which there are experienced certain peculiar sensations, arising from nervous excitement, and which may have the best effects upon the health of the patient. The operations and results of animal magnetism altogether resemble what we conceive of magic; and they are still a subject of general doubt and suspicion, but rather from want of knowledge than from any other cause, seeing that the French Academy, the most respected body of scientific men in the world, have satisfied themselves, *by experiments*, that, startling as the discovery is, it is quite true and free from imposture, and have here testified that such is their belief to the whole world.

The process of animal magnetising is generally performed in the following manner:—The patient is placed in a sitting posture, in a convenient elbow-chair, or on a couch—sometimes even in a common chair. The magnetiser, seated on a chair a little more elevated, and at the distance of about a foot from the patient, collects himself for some moments, during which he takes the thumbs of the patient between his two fingers, so that the interior parts of the thumbs are in contact with each other. He fixes his eyes upon the patient, and remains in this position till he feels that an equal degree of heat is established between the thumbs of both parties. He then withdraws his hands, turning them outward, places them on the shoulders, where he allows them to remain about a minute, and then conducts them slowly, with a very slight friction, along the arms to the extremity of the fingers. This operation he performs five or six times, which the magnetisers call a *pass:* he then places his hands above the head, holds them there a moment, draws them downwards in front of the face at the distance of one or two inches to the pit of the stomach, resting his fingers upon this part of the body; and, lastly, descends slowly along the body to the feet. These *passes* are repeated during the greater part of the sitting; and when he wishes to terminate it, he prolongs them beyond the extremity of the hands and feet, shaking his fingers each time. Finally, he makes transverse *passes* before the face and breast, at the distance of from three to four inches, presenting his hands approximated to each other, and separating them abruptly.

There are variations upon this process, but it is unnecessary to notice them here. The result, where there is no obstacle or deranging cause, is, that the patient falls involuntarily into a kind of trance, the progressive sensations of which are thus classified by a German philosopher, named Kluge:—

"The *first* degree presents no remarkable phenomena. The intellect and the senses still retain their usual powers and susceptibilities. For this reason, this first degree has been denominated the degree of *waking*.

"In the *second* degree, most of the senses still remain in a state of activity. That of vision only is impaired; the eye withdrawing itself gradually from the power of the will. This second degree, in which the sensibility is partially disturbed, is by some magnetisers called the *half-sleep*, or the *imperfect crisis*.

"In the *third* degree, the whole of the organs through the medium of which our correspondence with the external world is carried on (the senses) refuse to perform their respective functions, and the patient is placed in that unconscious state of existence which is called the *magnetic sleep*.

"In the *fourth* degree, the patient awakes, as it were, within himself, and his consciousness returns. He is in a state which can neither be properly called sleeping nor waking, but which appears to be something between the two. When in this state, he is again placed in a very peculiar connection with the external world. This fourth degree has been distinguished in the writings of the animal magnetisers, by the name of the *perfect crisis*, or *simple somnambulism*.

"In the *fifth* degree, the patient is placed in what is called the state of *self-intuition*. When in this situation he is said to obtain a clear knowledge of his own internal mental and bodily state, is enabled to calculate, with accuracy, the phenomena of disease which will naturally and inevitably occur, and to determine what are their most appropriate and effectual remedies. He is also said to possess the same power of internal inspection with regard to other persons who have been placed in magnetic connection with him. From this fifth degree all the subsequent magnetic states are comprehended under the denomination of *lucidity*, or *lucid vision* (Fr. *Clairvoyance;* Germ. *Hellsehen.*)

"In the *sixth* degree, the *lucid vision*, which the patient possessed in the former degree, extends to all objects, near and at a distance, in space and time; hence it has been called the degree of *universal lucidity*."

The source of the phenomenon is by some supposed to be in a circulating fluid, analogous to the blood, but imperceptible, and residing in the nerves, and which has a power of expanding beyond the sphere of the body, and affecting near or distant objects. This fluid, if it be the seat of the magnetic power, is probably obedient to the volition or will, for persons more than usually susceptible of the magnetic influence have been operated upon involuntarily, and unexpectedly to themselves, by a magnetiser who took his position in another room, and only exerted an energetic and intense desire to produce the effect. This is no doubt mysterious, and very like superstition; but is there any better explanation at the present day for *mineral* magnetism—for the cause and nature of disease—for the simple phenomenon of mortal life? Animal magnetism, in fact, appears to us as not more unintelligible than any of these things, and it would certainly have been long ago received, like them, into the sphere of acknowledged truths, if it had not been so very wonderful as to excite suspicion even where the senses were satisfied of its existence.

It is obvious from the experiments reported by the French Academy, that there is an intimate connection between ordinary somnambulism or sleep-walking, and the intuitive power, independent of the senses, which is developed during the fits produced by the magnetic influence. Sleepwalkers perform amazing feats, and execute the most intricate and delicate operations, without the natural sight which would be necessary, in a waking person, even to attempt such hazardous and difficult processes. Some persons, on the other hand, who have been artificially thrown into this state, or something like it, by magnetism, have shown themselves to possess senses and powers of action distinct from those which we use in our waking moments. The French Academy report upon four individuals who exerted greater strength and agility while magnetised than in their usual state; upon two who, with their eyes closed, distinguished and described objects placed before them; upon other two who foresaw, several months previously, the day, the hour, and the minute of the access and return of epileptic fits, and one who announced the period of his cure; and upon one, who, when thrown into magnetic somnambulism, and placed in contact with an individual in unsound health, pronounced, in three several instances, the exact internal state of these persons, one of which descriptions was confessed by the gentleman so inspected to be correct so far as he knew, and another was found equally so, upon dissection after death.

Perception without the use of the senses is well known to have frequently taken place in diseased persons; and it is a familiar fact, that, where one sense is extinguished, another sometimes takes up its operations, and, at least in part, supplies its place. Instances of persons who could see with the stomach are frequent, and perfectly well authenticated. The physician Van Helmont, by tasting a particular poisonous root, ceased for several hours to hear, think, know, or imagine any thing by means of his head or brain, and found that all the functions of that organ were transferred to the pit of the stomach, where, it is supposed, the capital of the nervous system is situated. M. Petetin, an eminent physician at Lyons, had a cataleptic patient—a lady—who seemed for a long time to be in a state of complete torpor and insensibility. He discovered, however, by accident, that she heard him perfectly when he spoke upon her stomach. Having satisfied himself of this fact by repeated trials, he afterwards perceived that the case was the same in regard to the senses of sight and smell. His patient read with the stomach, even through an intervening dark body. At last he found that it was not necessary for him to speak immediately upon the stomach; but it was quite sufficient to speak at the extremity of a conductor, of which the other extremity rested upon that part of the patient's body. Petetin published an account of these facts above forty years ago. He subsequently found other cataleptic patients, who exhibited precisely the same phenomena, with this difference, that, in some cases, the faculties were found to be transferred, not only to the epigastrium, or pit of the stomach, but also to the extremities of the fingers and toes. In others, where these phenomena took place, there was a prodigious developement of the intellectual powers, and a foresight of their future diseased symptoms. An account of some of his experiments is thus given from his posthumous volume by Mr Colquhoun:—

"M. Petetin secretly placed pieces of cake, biscuit, tarts, &c. upon the stomach of one of these patients, which was immediately followed by the taste of the particular article in the mouth. When the substance was enveloped in silk stuff, no sensation was felt by the patient; but the taste was immediately perceived on removing the covering. An egg was covered over with varnish, and the patient felt no taste until the varnish was removed. One of the patients distinguished a letter addressed to her, which was folded four times, inclosed in a semi-transparent box, and held in M. Petetin's hand upon her stomach.*

"A letter was placed upon the fingers of one of the patients, who immediately said, 'If I were not discreet, I could tell you the contents; but to prove that I have read it, there are just two lines and a half.' The same patient enumerated exactly the most remarkable articles which were in the pockets of a whole company.†

"These phenomena are sufficiently wonderful; but the following experiments afforded still more surprising results. Another patient, Madame de St Paul, was in a state of as perfect somnambulism as the preceding, only that, during the crisis, she was incapable of speaking. She carried on a conversation, however, by means of signs, with the Chevalier Dolomieu, brother to the celebrated naturalist, who interrogated her mentally. 'After placing the chain,' says M. Petetin, 'upon the *epigastrium* of the patient, I gave the ring to M. Dolomieu. No sooner had this gentleman touched his lips, than the features of Madame de St Paul expressed attention. Every question addressed to her mentally gave a new expression to her countenance, and produced a great change upon that of the interrogator. She ended by smiling, and making two approving signs with her head. M. Dolomieu declared that this lady had answered categorically to his thoughts.'

"M. Dolomieu then requested the patient to answer, by affirmative or negative signs, to the questions which he was about to put to her aloud. He succeeded in making her express that what he had in his pocket was a silver seal with three sides, and the name of the animal engraved on his arms.

"Finally, it was found, in the course of these experiments, that if several persons form a chain, the

* Report of the Experiments on Animal Magnetism, made by a Committee of the Medical Section of the French Royal Academy of Sciences, 1831, translated, and now, for the first time, published, with an Historical and Explanatory Introduction. By J. C. Colquhoun, Esq. Edinburgh: R. Cadell. 1833.

* "Plutarch relates that a certain governor of Cilicia wished to try whether the oracle of Mopsus could read, without opening it, a sealed note containing the following words: 'Shall I sacrifice to thee a white or a black ox?' The oracle returned the note unopened, with the answer, 'black.'—Plutarch, *On the cessation of Oracles.*"

† In our next number will be presented a variety of instances in which perception was exerted without the use of the senses:—also some of the cases in which animal magnetism has been of service in medicine.

last having his hand upon the stomach of the patient, and the first, who is at the greatest distance, speaks in the hollow of his hand, the patient will hear perfectly well, but will cease to hear even the loudest voice, if the communication between the chain be interrupted by a stick of sealing-wax."

Such facts as these—for that they are facts is not to be disputed—testify that there are powers and susceptibilities in our frames with which we are yet imperfectly acquainted, but which may be developed hereafter to such a degree as to be eminently serviceable to mankind. That there is a connection between the magnetic phenomena and those described immediately above, seems beyond a doubt; and that electricity enters into the latter, is evident from the fact of a non-conducting substance deranging the effect. Little else is yet known on this curious subject; but when more facts shall have been amassed, it will both be more easily reduced to a system, and more generally and readily believed. Animal magnetism will yet, in all probability, explain many things which we now look upon as the superstitions of a former and less enlightened age—the magical powers of remote antiquity, the oracular system of Greece, the *evil eye* among the Mussulmans, the false miracles of the early opponents of Christianity, the *glamour* of the modern gypsies, witchcraft, the royal touching for scrofula, and second-sight. Let no one be unduly sceptical on this subject: the most philosophical minds in Europe have acknowledged that it is, to the extent above described, free from imposture; and if such have so pronounced *from* observation and experiment, it would be hard, indeed, if common minds, *without* those means of judgment, were to be allowed to deny the theory, merely because it does not tally with the preconceived ideas of their imperfect understandings.

HARRIET BRUCE.

"To be beloved is all I need,
And whom I love I love indeed.—COLERIDGE.

My friend Harriet Bruce was a healthy, tall, bold-looking girl; somewhat too large and vigorous for genuine beauty, yet gifted with a speaking expression, and a rich, perpetual colouring, that would have made any other face stylish and attractive. She was no favourite with the gentlemen; but there was an indescribable something about her appearance and manners which always compelled them to inquire who she was. No person ever talked with her without remembering what she said; and every one criticised what they could not forget. Yet it was not intellect that made her unpopular—had she chosen to affect reckless misanthropy, maudlin sensibility, or any other foppery whereby to distinguish herself, she would have found plenty of admirers and imitators; but, in her mind, genius was checked by manly philosophy; and she could ill conceal her contempt of those who knew talent only by its most common diseases. The consciousness of mental power, that lighted up her eye with such a burning spark of pride, and the expression of scorn for ever dancing on her lip corners, ready to embody itself in sarcasm, was unquestionably the true reason why this splendid creature became the Paria of the ball-room. She was a strange sort of Die Vernon—no, she was not a Die Vernon either—and as I now remember her, I cannot think of a single character, living or imaginary, whom she did resemble. She fascinated her enemies, but never pleased her friends. Power! power! and, above all, intellectual power! was the constant dream of her wild ambition. To have been sure of Madame de Staël's reputation, she would have renounced human sympathy, and lived unloving and unbeloved in this wide world of social happiness—there was such magnificence in the idea of sending one's genius abroad, like a spark of electricity, to be active and eternal—defying education in its form, duration, and power! Sometimes I talked of love, and reminded her how Madame de Staël herself had become its reluctant victim. On this subject she often philosophised, and always laughed. "Who," said she, scornfully, "who that has felt the gush and the thrill attendant upon fame, would be foolish enough to exchange dominion over many for the despotism of one?" Thus Harriet Bruce reasoned, and thus she actually thought; but I knew her better than she knew herself. Her affections were as rich and overflowing as her mental energies; and her craving for human sympathy was in direct proportion to that intense love of beauty, which, in her, amounted to an intellectual passion. That she would love exclusively and extravagantly, I had no doubt; and my penetration soon singled out an object. At a large party, I first saw her with George Macdonough, the son of a rich southerner, first in his class, and in the full flush of manly beauty. I knew by the carriage of his neck that he was a Virginian; and the hauteur with which he received adulation attracted my attention, as the pawing of a high-mettled horse would have done. His conversation with Harriet seemed at first to be of a sober and learned cast, but on her part it soon became petulant. Now and then I heard some remark which seemed to relate to a transmigration of souls, and a continual rise in intellectual existence. "Oh," exclaimed Harriet, "how that idea savours of New England house-keeping!—how can a Virginian patronise a theory so economical?" At that moment, a very lovely girl entered the room; and the young man did not answer Miss Bruce's question. "Ah, there is the beautiful Baltimorean," said he, "she whom I told you reminded me of that fine engraving of yours, 'La belle Suisse.'" "She *is* beautiful," said Harriet, with unaffected warmth. "Her full dark eyes are magnificent—what a pity it is they are not lighted from *within*; that expression alone is wanting to fill the measure of her glory!" The remark was made to an inattentive listener, for Macdonough's whole interest was absorbed by the new comer. A slight shade passed over Harriet's face—but it was too transient to define the emotion in which it originated; and she smiled, as she said, "You had best go and talk with your powerful beauty—the body should be where the spirit is." "That reproach is too severe," replied the Virginian. "I meant no reproach," she answered; "I have observed that beauty is your idol, and I wish you to worship it." "I did not think Miss Bruce had observed my character sufficiently to form any conclusion with regard to my taste." The pride of the proudest girl in Christendom was roused—and there was something indescribably provoking in her manner, as she answered, "I assure you I think you quite a specimen in your way. 'Society is such a bag of polished marbles,' that any thing odd is as valuable a study as the specimens of quartz Mr Symmes may bring us. Your modesty has led you into a mistake; I have really taken the trouble to observe you." "Truly, Miss Bruce, you are the most singular girl I ever met," said the offended southerner; "you never did, said, nor thought any thing like another person."

"When a compliment is doubtful, Chesterfield says, one should always take it; therefore, I am obliged to you, Mr Macdonough," replied Harriet. And so saying, she turned abruptly from him, and directed her attention to me.

During the remainder of the evening, I saw no indications of a reconciliation. Harriet danced but once—Macdonough and La belle Suisse were near her in the set; and they met frequently. The *extreme* nonchalance with which she now and then exchanged some casual remark, led me to suspect that he had obtained more power over her extraordinary mind than any other individual had ever possessed; but Harriet was no trifler, and I did not venture to prophesy.

Time passed on, and with it nearly passed the remembrance of this skirmish of words, and the thoughts thereby suggested. My unmanageable friend seldom alluded to the fascinating acquaintance she had formed; and when she did, it was done naturally and briefly. Soon after this, I was obliged to be absent for several months. I did not return until two days before commencement at college; and Harriet's first exclamation was, "You *must* go to Mr Macdonough's room—he is to have the first part, and his friends expect every thing from him!" "But I thought you considered commencement days very stupid things," said I. "So I do; you know I always said life itself was a very stupid thing. There is no originality above ground: every thing that is true is dull, and every thing new is false and superficial. But there is no use in quarrelling with the world—it is a pretty good world, after all. You must go to hear Mr Macdonough's opinion of it: I am sure he will express it eloquently." "Then you are on good terms *now*?" said I. She blushed painfully—excessively—but soon recovered self-command enough to reply, "I always thought highly of him." I do not know whether my looks expressed the warning voice my heart was yearning to utter; but I am sure the tone of my assent was reluctant and melancholy.

George Macdonough appeared most brilliantly on that memorable day. Graceful and dignified, handsome and talented, he sent a thrill to all hearts alive to the grandeur of thought or the beauty of language. During this scene of triumph, I watched the countenance of Harriet Bruce with the keenest interest; and never before did I see a human face through which the soul beamed with such intensity. Genius, and pride, and joy, and love, were there! I then thought she was intellectually beautiful, beyond any thing I had ever seen. Poor Harriet! It was the brightest spot in her life, and I love to remember it.

Macdonough's room was crowded, and the compliments he received were intoxicating; but in the midst of it all, I imagined I could see the sparkle of his eyes melt into softness, when he met a glance from Harriet. Her looks betrayed nothing to my anxious observation; but once I took notice she called him "*George*," and suddenly corrected herself with an air of extraordinary confusion. Had my friend indulged in habits of girlish trifling, I should no doubt have playfully alluded to this circumstance; but there was something in her character and manners which forbade such officiousness. I watched her with the anxiety of sincere friendship. I knew when she once selected an object of pursuit, her whole soul was concentrated; and I could not believe that the proud Virginian, with all his high hopes, and his love of dazzling beauty, would ever marry her. I knew he was a very constant visitor, and I frequently observed lights later than had been usual in Mr Bruce's quiet habitation; and when he called to bid me farewell, a few weeks after commencement, the deep gloom on his countenance led me to think that the pride and apparent indifference of my intellectual friend might have surprised him into love.

Weeks and months passed on, and I seldom heard an allusion to the absent Macdonough. Harriet's character and manners seemed changing for the better. The perpetual effervescence of her spirit in some measure subsided, and the vagaries of her fancy became less various and startling; yet there was ever a chastened cheerfulness of manner, and an unfailing flow of thought. By degrees her seriousness deepened, and at last she could not conceal from me that she was unhappy. I attributed it to the illness of her aged father, for Harriet was motherless, and she cherished her only parent with a double share of love. But when the old man was evidently recovering, and her melancholy still increased, I knew there must be another, and a deeper cause. One day, as I stood by her, watching her progress in a crayon drawing, around which she had thrown much of her early spirit and freedom, I placed my hand affectionately on her shoulder, and, touching her forehead with my lips, said, "You have always told me your thoughts, Harriet—why not tell me what troubles you *now*?" She continued her task with a quick and nervous movement, and I saw that her eyes were filling with tears. I gently whispered, "Is George Macdonough the cause?" She gave one shriek, which sounded as if it made a rent in her very soul, and then the torrent of her tears poured forth.

It was long before I ventured to say to her, "Then it is as I feared? You do love George Macdonough?" She looked in my face with a strange and fixed expression, as she replied, "I ought to love, and honour, and obey him; for he is my husband!" I started! "Your husband! how—when—where were you married?"

"At Providence. Do you remember when I asked you to go with me to Mr Macdonough's room, and you said, 'So, then you are on good terms *now*?'—I had been three weeks a wife!"

"And your father—does he know of it?"

"Certainly," she said; "you know I would not deceive *him*." "Then why was so much secrecy necessary?" "I now think it was not really necessary; at all events, that which needs to be concealed is wrong. But George's parents wished him to marry wealth, and he feared to displease them. He has a moderate fortune of his own, of which he will soon come in possession; when he told my father this circumstance, and added that he feared he should be urged to marry against his inclination, my father, in the blindness of his dotage, consented to our immediate union." "Then why are you so unhappy?" I inquired; "you have no doubt that your husband will come and claim you?" "Oh, no! The certificate is in my father's hands; and if it were not, a sense of honour would lead him here. But, oh! to have him come coldly and reluctantly! my heart will break! my heart will break!" said she, pressing her hand hard against her forehead, and weeping bitterly. "How *could* I forget that they who listen to passion, rather than to reason, must always have a precarious influence on each other?" I tried to console her—she said nothing, but took a package of letters from her desk, and handed them to me. Their contents proved the mournful prediction of her fears too true. At first, George Macdonough wrote with impatient ardour; then his letters were filled with amusing accounts of the parties given to La belle Suisse, whose father had come to reside in their neighbourhood; then he filled his pages with excellent reasons for not visiting her as soon as he intended; and, finally, when Harriet bowed down her pride, and entreated him, if he valued her reputation, to come soon, he sent a cold laconic answer, merely stating the time at which he might be expected. Poor Harriet! It was too evident she had thrown away all that made existence joyful. However, I tried to soothe her by the idea that gentleness, patience, and untiring love, might regain the affection on which her happiness *must* now depend. She loved to listen to such words—they were a balm to her heart.

Mr Macdonough came at the time he had appointed, and publicly announced his marriage. I did not see their meeting; but during the few months he remained at her father's, I observed his manner was uniformly kind, though frequently absent and constrained. An infant daughter formed a new bond of union, and seemed to be the herald of happier days. The young man watched over the little object with the most intense delight, and Harriet's half-subdued character seemed entirely softened, in the doating fondness of a mother, and the meek resignation of a wife, loved, "but not enough beloved;" none would have recognised the proud, ambitious, and sarcastic Harriet Bruce.

I must not dwell minutely on particulars, which I observed closely at the time, and which afterward sunk deeply into my memory. Young Macdonough departed once more to take possession of his estate, and prepare it for the reception of his wife and child.

His farewell was affectionate, and his frequent letters seemed to restore my imprudent friend to something of her former buoyancy of soul. The idea of separation from her father was now her principal source of unhappiness; but that trial was spared her; the imbecility of the affectionate old man daily increased, and, a few days before his daughter's departure, death relieved him from the expected loneliness.

The young husband came, as he had promised; but his manner was colder, and his looks more stern than formerly, though none could say he failed in the fulfilment of his duty. Harriet never spoke of any change; her manner toward him was obedient and

affectionate, but never fond. Her romantic visions of human perfection, her proud confidence in her own strength, were gone, and, no doubt, she wept bitterly over their mutual rashness. Knowing, as she did, that she was a burthen, taken up merely from a sense of honour, it is not wonderful her very smile had a look of humility and resignation. Their regrets were, however, kept carefully concealed; whatever might have been their feelings, both seemed resolved on a system of silent endurance. There was something in this course a thousand times more affecting than the most pathetic complaints. I shall never forget the anguish I felt when I saw Harriet bid farewell to the home of her childhood—that home where she had ever been an idol and an oracle. The lingering preparation of departure—the heart-broken expression—the reluctant step—the drooping head—and the desperate resolution with which she at last seized the arm of a husband who loved her not, and who was about to convey her among strangers—they are all present to me now!

Harriet's letter soon spoke of declining health; and before three years had elapsed, she implored me to come to her, if I ever wished to look upon her again in this world of shadows.

I immediately obeyed the summons. Things were worse than I had expected. She was evidently very weak; and though she had every thing which wealth could supply, or politeness dictate, the balm of kindness never refreshed her weary and sinking spirit. Mr Macdonough never spoke harshly—indeed he seldom spoke at all; but the attentions he paid were so obviously from a sense of duty, that they fell like icedrops on the heart of his suffering wife. I heard no reproaches on either side; but a day seldom passed without some occurrence more or less painful to my friend. Once, when little Louisa jumped into her father's arms, as he entered, and eagerly exclaimed, "Do you love me, papa?" he kissed her with much fondness, and replied, "Yes I do, my child." "And mamma too?" inquired the little creature, with a sort of half entreating tone, so graceful in childhood; he put her away from him, and answered coldly "Certainly, my daughter." I saw a slight convulsion in Harriet's face, and in the motion of her hands; but it soon passed. At another time, when we were searching in his private library for the latest number of the Edinburgh, we discovered on a small open desk the engraving of La belle Suisse, and near it a newspaper giving an account of the marriage of that young Baltimorean whom George had thought so strongly resembled the picture. The surprise was so sudden, that Harriet lost the balance of feelings she had hitherto so well preserved. She rushed out of the room—and it was several hours before I was admitted to her bedside.

Fortunately for my sensitive friend, this mental struggle was too fierce to be of long continuance. The closing scene of her life drew near; and to her it seemed welcome as sleep to the weary. Sometimes the movements of reluctant nature were visible in the intense look of love she cast upon her child, and the convulsive energy with which she would clasp the little one to her bosom; but otherwise all was stillness and hope.

One day, when she had been unusually ill, and we all supposed she was about to die, she pressed my hand feebly, and whispered, "Will you ask George to see me once more?" I immediately repaired to the library, and told Mr Macdonough the dying request of his wife. At first, he made a motion toward the door, then, suddenly checking himself, he said, in a determined tone, "I had better not. It will be painful to both. I will wait the event here." I returned to Harriet, but I had not courage to say her request was refused. She listened eagerly to every sound for a while; then looking in my face mournfully, she said, "He will not come!" My tears answered her. She looked upward for a moment, with an expression of extreme agony; but never spoke again.†

† From "the Western Coronal," by Mrs Child.

PRACTICES OF LITERARY MEN.

How different are the times and modes of study practised by literary men in all nations and ages! Demosthenes studied always during the night, utterly secluded, and quaffing at cold water. Demades, his rival in the forum, hardly studied at all, but dissipated away his time amid wine and licentiousness. Æschylus was said to be always drunk when he wrote; whence Sophocles remarked of him, with some of the bitterness of jealousy, that, "if he wrote well, he did so perchance and unwittingly." I should infer from Homer's simple style, that he was a drinker of cold water. Not only Æschylus, but Alcæus and Aristophanes, composed their poetry in a state of excitation from liquor; yet Anacreon, bacchanalian as he was, wrote, it is said, always sober—he only feigned inebriety. Among modern writers I have only heard of Tasso and Schiller who composed in a state of semi-inebriation. Schiller used to study till long after midnight, with deep potations of Rhenish. Tasso was wont to say, that malmsey was that alone which enabled him to *compose good verses.—Mr Tennant of Dollar, MS.*

To this it may be added, that Sir William Blackstone is said to have always had a bottle of good port beside him, from which he occasionally regaled himself, while composing his great work, "Commentaries on the Laws of England." We are inclined, however, to believe that liquor does more harm than good in all intellectual exertions. There may be *some* whom certain drinks have a tendency to exhilarate, and who cannot write unless so excited. But the most common result of all indulgences of this kind is to stupify, not to brighten; and, accordingly, as literary exertion requires all the mind that can be brought to it, it appears to us as only an idea fit for bacchanalian poetry to say that an author, whether of prose or verse, is the more fit for his task that he has previously imbibed a certain quantity of spirituous liquor.

LITHOGRAPHY.

By Samuel Leith, Esq.*

Lithography is the art of printing from stone. It is only of recent invention, and differs very considerably in principle from the art of printing from moveable types, wooden blocks, or copper or other plates. The process consists in writing on a particular kind of stone, and from thence working off, by a press, any number of copies, the writing thus standing in relief on the stone like raised letters. The peculiar value of this ingenious art is in the cheapness and ease with which it accomplishes impressions of pictorial delineations or manuscript. The discovery of the lithographic art was made, upwards of thirty years since, by Senefelder, a native of Germany—a country to which the human race is also indebted for the more noble art of printing from types; but since that period very great improvements have been made upon it in Britain.

The history of the origin of lithography is instructive, and affords to the young an additional instance of the triumph of genius over poverty and its attendant disadvantages. Like every new invention, when first attempted to be brought into notice, it met with all the obstacles which ignorance and prejudice could throw in its way; and it was not till after years of laborious perseverance, accompanied with all the evils attendant on very limited means, that the inventor succeeded in establishing his reputation, and gaining for the new art its due degree of admiration.

Senefelder relates, with the greatest candour, that having become an author, and at the same time being so poor that he could not raise the necessary funds for the printing of his work with a view to publication, he endeavoured to devise some method by which his object might be attained; and, after much anxious consideration, he resolved on attempting to accomplish it with his own hands. With this view, his attention was first directed to several original and curious modes of stereotype, some of which he considerably matured; and had his circumstances at this period been such as to admit of his devoting a sufficient time to the perfecting of this first part of his undertaking, it is questionable whether his talents would have ever been *forced* into that particular line of study, which, in the end, acquired for his name so great a celebrity. The same remark is applicable to some of the other ingenious attempts which preceded his great discovery. For a time, however, plan succeeded plan, each being abandoned in turn, as new and more plausible theories struck his fancy, and in this way did he persevere, for many months, with various degrees of success, but without the necessary results; and he at last relinquished this course of experiments altogether, as presenting too many obstacles to be overcome by an individual in his circumstances.

Disappointed, but not disheartened, in not having been so successful in his operations as he had anticipated, we next find him attempting to realize his hopes by substituting plates of copper and tin for his metal and composition blocks; but this second course of experiments was attended with little better success than the former; for, after much labour, and numerous trials with the etching needle, and by writing on the copper with different chemical inks of his own composition, this medium was found to be liable to all the objections which had deterred him from prosecuting the stereotype plan. Being, however, still of opinion that his object was to be accomplished by *art* alone, and having laid aside his copper plates for a time as too expensive, he began to look around for a substitute which would supply their place for all the purposes of practice, and at a much less cost. He was not long in determining this point; for, being aware that certain kinds of stone had often been used for similar purposes, he converted the slab on which he ground his colours into a plate for exercising in writing, and found it answered his expectations completely. Experiments now followed each other in rapid succession, all tending to encourage him in the prosecution of his design; and when at length these stone plates were rendered fit for undergoing the operations of the printing press, he was greatly pleased to find that numerous impressions might be taken on paper, without materially injuring the original.

We shall now at once advert to the time when circumstances conspired to force upon his attention those properties of the art which, on their first unfolding themselves, so astonished and delighted him. "I had (says he) just succeeded in my little laboratory in polishing a stone plate which I intended to cover with etching ground, in order to continue my exercises in writing backwards, when my mother entered the room, and desired me to write her a bill for the washerwoman, who was waiting for the linen. I happened not to have even the smallest slip of paper at hand, as my little stock of paper had been entirely exhausted by taking proof-impressions from the stones; nor was there even a drop of ink in the inkstand. As the matter would not admit of delay, and we had nobody in the house to send for a supply of the deficient materials, I resolved to write the list with my chemical ink, on the stone which I had just polished, and from which I could copy it at leisure."

When about to remove this writing from the stone some time afterwards, the idea struck him, that, by submitting its surface to the action of aquafortis, such an elevation might be given to the writing as would render it suitable, in the same way as wood-engravings, for receiving printing ink. The experiment exceeded his most sanguine hopes, and he lost no time in following up his success with others, all tending to convince him that he had discovered a new and important art.

Thus it will be seen, that, to a very simple occurrence in itself, Senefelder was indebted for the *hint* on which hinged all his succeeding improvements.

Having now briefly adverted to some of the leading incidents which ultimately led to the discovery of chemical lithography, we shall next proceed to the notice of such particulars concerning the progress of the new art under the fostering care of its author, as may be thought generally interesting.

Let it not be imagined that Senefelder's difficulties ceased with his discovery: the fact is otherwise; for, in addition to the many obstacles which he had to combat from lacking the necessary funds for the prosecution of his labours, others were not wanting of a nature equally serious, and which were to him the source of long and painful anxiety. Among the rest, it was not a little annoying to know that others were beginning to lay claim to the merit of the new discovery. But these, and other particulars connected with this part of our subject, must form matter for a future article.

* We have to express our thanks to Mr Leith for this article upon a subject which he is so well qualified to illustrate. To such of our readers as may not be acquainted with the name and productions of this gentleman, it may be necessary to mention, that he is a lithographic artist, residing at the remote town of Banff, in the north of Scotland, who has produced specimens, in music, in chalk drawing, and other branches of the art, of unparalleled beauty and finish, and which have excited surprise and admiration wherever they have been seen. Mr Leith has lately achieved a signal triumph in the production of several specimens imitating what is called the *line* manner of engraving, a style of much delicacy and difficulty, but which he has, nevertheless, represented on stone with such felicity, that the prints, at a very little distance, could hardly be distinguished from copper engravings.

THE ENGLISH VILLAGE.*

There is something very pleasing in rural sounds and rural objects. The noise of village boys playing at cricket, the cawing of the rooks in a still evening, the distant tread of a horse, the sheep-bells, even the village clock, are all pleasant. I like to see cows going to be milked, and inhale with satisfaction the fresh and fragrant perfume which one perceives as they pass by. Those that have calves are always in advance, and show their impatience to reach their young by an occasional bellow and a short run, and then a sudden stop, to listen whether they can hear the call of their calves. If they do, how eagerly they advance to the gate of the farm-yard, and show the utmost anxiety to have admittance! The clean well-scoured milk-pails and churns are no unsightly objects; and while the process of milking is going on in a well-littered farm-yard, the cows quietly chew the cud, and appear contented and happy. Those, however, which have been recently deprived of their young ones, show a reluctance to give down their milk, and many retain some of it, from a maternal feeling that their offspring may require it.

In the spring, one hears the wild whirl of a number of sparrows as they rapidly pass by, and then settle in some neighbouring bush or hedge, chirping and scolding one another, till some culprit who has been pursued again takes flight, and is again followed with the same clamorous noise. This is succeeded by the song of the thrush on the top of some high elm tree, and late in the evening the nightingale makes himself heard.

> Ten thousand warblers cheer the day, and one
> The livelong night!

On a fine summer's day, we hear the tinkling of pans and shovels, to persuade a hive of bees to settle in some cottage garden, and are pleased even with the whetting of scythes in a neighbouring field. The gabbling of a turkey-cock, the peevish call of a guinea-fowl, and the cry of pigs for their evening food, are far from being unpleasant sounds to those who delight, as I do, in the country.

> The village church among the trees,
> Where first our marriage vows were given,
> With merry peals shall swell the breeze,
> And point with taper spire to heaven.—Rogers.

I like also a village church. The peasant enters in his clean smockfrock, smooths down his hair, says, or appears to say, a word in his hat, which he carefully and deliberately hangs up, and then leans with crossed arms over the door of the pew till the service begins. Both before and after church, he may be seen

* This unsophisticated sketch, from "*Gleanings in Natural History*," is written by Edward Jesse, Esq. deputy-surveyor of his Majesty's parks, and is an excellent picture of an English village, and ought to be read with attention.

standing with his back against the low wall of the churchyard, with perhaps the hand of a favourite child in his, talking over some village news. As the squire or the clergyman pass by, he touches his hat to them with respect and affection; and in the evening he may be seen with his cottage-door open, drinking tea with his wife and children, and then sauntering about with them either in his garden or some village lane.

The good old squire hobbles out of church, leaning on the arm of his daughter, and kindly inquires after the welfare of all about him. He sends food and money to the sick and needy, makes up quarrels as a magistrate, maintains a well-ordered Sunday-school, and promotes the happiness of the villagers by every means in his power. If, on returning from church, he meets a smoking dinner going to a cottage from the village bake-house, he generally slips a shilling into the hand of the bearer, for the purpose, as he says, of washing the dinner down with a little good ale. I must, however, add, that the old gentleman sometimes slyly takes a good-looking potato out of the dish, which he eats with evident satisfaction.

But how shall I describe our curate? His sunny good-humoured face is never seen without delight, by young and old, rich and poor. He joins in the village sports, and is a famous hand at cricket, and even condescends sometimes to play at trap-ball with the boys, who hail his arrival with great glee. He visits and assists all who want relief, and is never wearied in doing good. He always considers it a bad sign if one of his poor parishioners passes him without touching his hat, or seems to avoid meeting him. He then, with great tact and kindness, takes him to task. I have heard him say that he is sure to find that the man has been either foolishly spending his money in the alehouse, or his mind has been tainted by some sophisticated arguments. In either case he mildly endeavours to convince the culprit of the folly of his conduct, and generally succeeds in setting him right.

To all this good feeling, our curate has a mind stored with learning, and with a taste for the fine arts. He moreover dabbles a little in antiquities, and takes great delight in a naturalist's calendar, in which he makes observations equally agreeable and instructive.

Such was our village a few years ago; but, alas! alas! how it has been changed since! The greater part of our poor labourers are now discontented, and, consequently, idle. All the influence of the good curate has not been able to stem the torrent, and he is about to quit the village in despair of doing any farther good. The poor old squire has already left it, after having lowered his rents so much, that he could no longer afford to live with his usual kindness and hospitality. He has therefore abandoned his estates, his tenants, and his labourers, to the care of a mercenary bailiff, and is gone to reside in an overgrown town on the sea-coast, upon the residue of a once ample income.

I consider the aspect of the town as one of the most melancholy features of the present time. It is now resorted to by many under the same circumstances with our squire, by those who ought to have made every sacrifice to stem the torrent of disaffection, who should have given up their horses, their carriages, their hospitalities, sooner than quit their villages and country houses, and sever the tie which connected them with their tenants and labourers. They may hope to return in better times, and to replace things on their former footing; but that tie, once broken, cannot be restored, and it is melancholy to reflect on the consequences.

> O, favour'd land! renown'd for arts and arms,
> For manly talents, and for female charms!

Where shall we find a country like thee! Giving, as you have done, a tone to the morals, the energies, and public faith of all other countries, whom shame alone has forced to endeavour to imitate your bright examples, how dangerous is the position in which you are now placed! Those whose example should influence the morals and conduct of the peasantry are congregating in the metropolis, and destroying their time, and health, and fortune, in folly and dissipation. The peasantry are badly employed and badly paid,* and the appropriation of the poor's rates is generally left to mercenary farmers and interested shopkeepers. While the poor are thus neglected, they become careless of consequences, hardened, and disaffected. They marry, because they find that a married man receives more parish relief than they do, though perhaps the single man is the best workman; and the parish is burthened with the maintenance of their children.

I have lived all my lifetime in the country, and am well acquainted with the character of the English peasantry. Instances of profligacy and ingratitude may no doubt sometimes occur amongst them; but treat them as they ought to be treated, give them employment, and pay them properly for the work they do—

> Let labour have its due! my cot shall be
> From chilling want and guilty murmurs free.
> Let labour have its due! then peace is mine,
> And never, never, shall my heart repine.

And give them that moral and religious instruction and example which they have a right to expect, from those whom Providence has placed in a situation superior to themselves, and I will venture to assert, that a more orderly, grateful, and better-conditioned peasantry, would not be found on the surface of the earth.

I am unwilling to lose this last opportunity of stating my conviction of what is likely to take place, should the poor be abandoned to their own resources, while the rich and powerful are either forgetful of their wants and miseries, or are absenting themselves from the homes of their forefathers, and seeking for pleasures in the metropolis or watering-places. If they do neither of these, they are imbibing foreign habits and manners in foreign lands, and disqualifying themselves for undertaking the duties and enjoyments of an English country life.

Do not, however, let me be misunderstood. In speaking of the neglect experienced by the poor in many places, I am aware that amongst the rich and powerful of the land there are to be found numerous examples of disinterested charity and boundless benevolence. Where time and talents are employed, as they often are, in administering to the wants, and in bettering the condition of the poor, the beneficial results are always to be seen in the well-being, orderly conduct, and gratitude of the peasantry. Disaffection and riots were to be found only in those places where the fostering hand of kindness had been withdrawn.

* There can be no doubt of the poor labourers in this country being inadequately paid. A kind-hearted landlord, a clergyman, lowers his rent or tithes, and the farmer pockets the amount, without rendering a proportionate assistance to his workmen.

GIANTS, DWARFS, AND PIGMIES.

NOTWITHSTANDING the difference of opinion and controversy concerning giants and pigmies, it is sufficiently proved by travellers, whose veracity cannot be doubted, that there is not any country on the earth inhabited either by men who may strictly be called giants, or by pigmies. It is equally certain that in various parts of the earth the natives are taller and better formed than in other parts; but this observation also holds true in every district of our own country. Mr Pennant, to whose zeal and abilities as a naturalist the world is so much indebted, added another obligation in the testimony he has procured respecting the overcharged gigantic stature of the Patagonians. A Father Falkener, a Jesuite missionary in South America, but a native of England, whom Mr Pennant visited for the express purpose of gaining certain information concerning that people, as he had been sent on a mission into their country about 1742, says, the various tribes who roam over the mountains and barrens of Patagonia are all tall people; but, after making every reasonable allowance for the exaggerations of navigators, who made them eight and nine, to eleven and twelve feet high, it does appear that many, if not the most of them, are considerably above the ordinary stature of human beings. Falkener measured a cacique or prince of the Tehuls, and found him to be seven feet eight inches high. Their stature, measured with great accuracy by the Spanish officers of Cordova's expedition in 1785 and 1786, was found to be at the utmost seven feet one inch and a quarter, and the common height from six and a half to seven feet. It is to be remembered, however, as the translator of Cordova's narrative has remarked, that the *vara*, or yard of Burgos, the standard of Spain, contains 33.06132 inches, or two feet nine inches and one sixteenth of English; the tallest Patagonians, therefore, did not exceed six feet six inches and one-third English, and those of the common size were from five feet eleven inches and two-thirds to six feet five inches and one-seventh English. It is also to be remembered that Spaniards are not in general tall men, and that a seaman is seldom so among his countrymen; to them, therefore, the Patagonians might appear giants. "But even this height," says Cordova, "is not so striking as their corpulence, or rather bulkiness, some of them measuring four feet and four feet four inches round the breast; but their feet and hands are not in due proportion to their other parts. They all give evident signs of strength of body. They are all exceedingly muscular, but cannot properly be called fat. The size and tension of their muscles evince their strength; and their figure, on the whole, is not disagreeable, although the head is large even in proportion to the body, the face broad and flattish, the eyes lively, and the teeth extremely white, but too long. Their complexions, like that of other Americans, are pale yellow, or rather verging on a copper colour; they wear their black straight hair tied on the top of the head with a piece of thong or ribbon, brought round their forehead, having the head entirely uncovered. We observed some with beards, but which were neither thick nor long. Their dress adds much to the effect of their size, being composed of a kind of cloak made of the skins of llamas or zorillos, arranged with some skill."

The inhabitants of Patagonia seem to be an exception to all the other races of mankind, for we have no authentic information of any other nation growing to so large a size. Individuals of a gigantic stature have existed in almost all countries, and in all ages of the world; these cases, however, have been comparatively few and isolated. La Pierre, a Danish female, was seven feet in height. John Frederick Duke of Brunswick was eight feet six inches; and one of the King of Prussia's grenadier guards measured the same height. Reishart, a native of Frielberg, near Frankfort, in Germany, was eight feet three inches. There is the skeleton of an Irishman in the museum of the London College which measures eight feet four inches. Gilby, a native of Sweden, who was exhibited as a show, was eight feet in height.

There have been a number of instances of children attaining great preternatural growth at a very early age; among these we may mention one of the most extraordinary instances—a boy of the hamlet of Bouzanquet, in the diocese of Alais, now the department of Gard, in France. Though this child was of a strong constitution, he appeared to be knit and stiff in his joints till he was about four years and a half old. During this time, nothing farther was remarkable in him than an extraordinary appetite, which was satisfied only by giving him plenty of the common food used in the country, consisting of rye-bread, chestnuts, bacon, and water; but soon after this his limbs became supple and pliable, and his body beginning to expand itself, he grew up in so extraordinary a manner, that, at the age of five years, he measured four feet three inches; some months after he was four feet eleven inches; and at six he was five feet high, and bulky in proportion. Such was the rapidity of his growth that we might fancy we saw him grow. Every month his clothes were required to be made longer and wider; and, what was still very extraordinary in his growth, it was not preceded by any sickness, nor accompanied, as usual, with any pain. At the age of five years his voice changed, and at six he had all the appearance of a man of thirty.

Though his sensibility was greater than is commonly observable at the age of five or six years, yet its progress was by no means in proportion to that of his body; his air and manner still remained childish, though, by his thickness and stature, he resembled a complete man, which at first sight produced a singular contrast. His voice was strong and manly, and his great strength rendered him fit for the labours of the country. At the age of five, he could carry to a great distance three measures, weighing eighty-four pounds. When just turned of six years, he could lift up easily on his shoulders and carry loads of 150 pounds weight to a considerable distance; and these exercises were exhibited by him as often as the curious instigated him by any present. Such beginnings made people think that he would soon shoot up into a giant. A mountebank was already soliciting his parents to allow him to be exhibited, flattering them with hopes of putting him in the way of making a great fortune. But all these fond ideas soon vanished; his legs became crooked, his body shrunk, his strength diminished, his voice grew insensibly broken, and he at last sunk into a state of total imbecility.

A similar instance of a girl is recorded in the French Memoirs. This girl, at three years of age, resembled the generality of females of fourteen. When four years old, she was four feet six inches in height, and her limbs straight, and in all respects had the appearance of a well-grown girl of eighteen. These remarkable instances are the more to be wondered at, as taking place in northern climates, where mankind are later of arriving at maturity than in the southern countries.

The existence of a pigmy race has not recently been supported by any testimony worthy of credit, and all the accounts which have been detailed are now believed to be founded either in fable or error; but that dwarfs are and have been common in all countries and times, is so well known as to preclude the necessity of discussing the point.

Dwarfs, as well as men of great stature, formerly constituted a part of the equipage of a court. The dwarf, the fool or jester, and the giant, were marks of distinction attendant on the great. Geoffrey Hudson, who was born at Buckingham, in 1619, was a favourite at the court of James the First. This celebrated dwarf was the son of a labourer, and was born at Oakham, in Buckinghamshire, in the year 1619. At seven years of age he entered into the service of the Duke of Buckingham, being then only eighteen inches high. On the queen being entertained at Burleigh-house, the seat of the duke, little Geoffrey was brought on the table in a cold pie, the crust of which being broken, he was taken out and presented by the duchess to her Majesty, queen of Charles the First, who took him into her service, and afterwards sent him to France to fetch over her midwife. In a masque at court, the king's gigantic porter drew him out of his pocket, as if going to eat him, to the great surprise and diversion of all the spectators. In his passage to France he was taken by a pirate and carried to Dunkirk. His captivity and engagement with a turkey cock in that port were celebrated by Mr William Davenant, in his poem en-

titled Geoffreidos. It is said that after he was thirty years of age, he again commenced growing, and reached the height of three feet nine inches. His diminutive size did not prevent his acting in a military character; for, during the civil war, he was elevated, and served as a captain of cavalry. He followed his fortunes in France, in 1644, where he unluckily engaged in a quarrel with Mr Crofts, who, on a duel being agreed on, came into the field armed only with a syringe. A second meeting was appointed on horseback, in which Geoffrey killed his antagonist at the first shot. For this he was expelled the court, which induced him to go to sea, where he was again taken by a Turkish corsair, carried to Barbary, and sold as a slave. He found means, however, to obtain his release, and on his return was made a captain in the royal navy, and, on the final retreat of Queen Henrietta, attended her to France, and remained there till the Restoration. In 1682, he was committed to the Gate-House on suspicion of his being concerned in the Popish plot, where he ended his life at the age of sixty-three.

In the reign of Charles the First, a dwarf, named Richard Gibson, who was a page of the back-stairs, and a favourite at court, was married to Miss Ann Shepherd, another dwarf. His Majesty honoured this singular wedding with his presence, and gave away the bride; on which occasion Waller the poet composed the following verses:—

> Design or chance makes others wive,
> But nature did this match contrive.
> * * * *
> Thrice happy is that humble pair,
> Beneath the level of all care,
> Over whose head those arrows fly
> Of sad distrust and jealousy;
> Secured in as high esteem
> As if the world had none but them.
> To him the fairest nymphs do show
> Like moving mountains topp'd with snow;
> And every man a Polypheme*
> Does to his Galatea† seem:
> Ah, Chloris,‡ that kind nature thus
> From all the world had sever'd us;
> Creating for ourselves us two,
> As love made me for only you.

The bridegroom and bride measured each three feet ten inches. Mr Gibson's genius led him to painting; his performances in water colours were esteemed in his days, but the copies he made of Sir Peter Lely's portraits gained him the greatest reputation. He had the honour to be employed in teaching Queen Anne the art of drawing, and was sent into Holland to instruct her sister, the Princess of Orange. He lived to the advanced age of seventy-five; his wife survived him nearly twenty years, and died in 1709, at the great age of eighty-nine.

A dwarf of the name of Coan was exhibited in most parts of England for some years. He was likewise brought on the stage of one of the London theatres, where he was contrasted with a giant, each of whom sung for the entertainment of the company. He was only three feet high.

In the year 1823, there was exhibited in a caravan a dwarf of the diminutive size of two feet two inches. He was remarkably well proportioned, but of a very delicate constitution. He was so light, that we easily held him on the palm of our hand with outstretched arm.

In the year 1710, Peter the Great, Emperor of Russia, celebrated a marriage of dwarfs at St Petersburgh, which was attended with great parade. Although this monarch was possessed of genius of the first order, yet he was far from being refined in his intellectual enjoyments. The scenes in which he took delight were of a vulgar cast, and however they might have amused people in a humble rank, yet they were ill befitting a great prince. Upon a certain day, which was announced by royal proclamation some months previously, he invited the whole body of his courtiers, and all the foreign ambassadors, to be present at the nuptials of a pigmy man and woman. The preparations for this marriage were not only magnificent, but executed in a style of barbarous ridicule. He ordered all the dwarfs, both male and female, who resided within two hundred miles of St Petersburgh, to repair to the capital, and be present at the ceremony. Proper vehicles were supplied for transporting them; but he so contrived it, that one horse was seen dragging a dozen of them into a city at once, while the mob followed, shouting and laughing, from behind. At first, some of these little people were unwilling to appear at a ceremony which they were well aware was calculated to turn them into ridicule, and consequently failed to obey the summons of the emperor. He, however, soon compelled them to bend to his sovereign will, and, as a punishment, enjoined that they should wait upon the rest at dinner. The whole assemblage of dwarfs amounted to seventy, exclusive of the bride and bridegroom, who were richly adorned, and dressed in the extremity of the fashion.

Every article to be used by this diminutive company was in miniature—a low table, small plates, little glasses, and, in short, every thing corresponding to the size of the guests. It afforded the emperor great amusement to watch the gravity and pride manifested by these dwarfs, and the contention of the females for superiority over the men. This point he attempted to adjust, by ordering that the most diminutive should take the lead; but this did not answer the purpose, and bred disputes, for none would then consent to sit foremost. All this, however, being at last settled, dancing followed the dinner, and the ball was opened with a minuet by the bridegroom, who measured exactly three feet two inches high. In the end, matters were so adjusted that this diminutive company, who met together in gloomy pride, and seemed unwilling to be pleased with an entertainment which they attended through compulsion, being at last familiarized to laughter, joined the diversion, and became extremely sprightly and entertaining.

The following interesting history of a dwarf is taken from the *Histoire Naturelle* of Daubenton:—"This dwarf, whose name was Baby, was well known, having spent the greater part of his life at Louisville, in the palace of Stanislaus, the titular king of Poland. He was born near the village of Plaisne, in France, in the year 1741. His father and mother were peasants, both of good constitutions, and inured to a life of husbandry and labour. Baby, when born, weighed about a pound and a quarter. We are not informed of the dimensions of his body at that time; but we may conjecture they were very small, as he was presented on a plate to be baptised, and for a long time lay in a slipper. His mouth being very small, he was obliged to be suckled by a she goat that was in the house, and that served as a nurse, attending to his cries with a kind of maternal solicitude. He began to articulate some words when eighteen months old, and at two years he was able to walk alone. He was then fitted with shoes that were about an inch and a half long. He was attacked with several acute disorders; but the small-pox was the only one which left any marks behind it. Until he was six years old, he ate no other food but pulse, potatoes, and bacon. His father and mother were, from their poverty, incapable of affording him any better nourishment; and his education was little better than his food, being bred up among the rustics of the place. At six years old he was about fifteen inches high, and his whole body weighed but thirteen pounds. Notwithstanding this, he was well-proportioned and handsome; his health was good; but his understanding scarcely passed the bounds of instinct. It was at this time that the king of Poland, having heard of such a curiosity, had him conveyed to Lunenville, gave him the name of *Baby*, and kept him in his palace.

Baby having thus quitted the hard condition of a peasant, to enjoy all the comforts and conveniences of life, seemed to receive no alteration from his new way of living, either in mind or person. He preserved the goodness of his constitution till about the age of sixteen; but his body seemed to increase very slowly during the whole time, and his stupidity was such, that all instructions were lost in improving his understanding. He could never be brought to have any sense of religion, nor even to show the least signs of a reasoning faculty. They attempted to teach him dancing and music, but in vain; he never could make any thing of music; and as for dancing, although he beat time tolerably exact, yet he could never remember the figure, but while his dancing-master stood by to direct his motions. Nevertheless, a mind thus destitute of understanding was not without its passions.

At the age of sixteen, Baby was twenty-nine inches high; at this he rested; but having thus arrived at his acme, the alterations of old age came fast upon him. From being very beautiful, the poor little creature now became quite deformed; his strength entirely forsook him; his back-bone began to bend; his head hung forward; his limbs grew weak; one of his shoulders turned awry; and his nose grew disproportionably large. With his strength his natural spirits also departed; and by the time he was twenty, he was grown feeble and decrepit, and marked with the strongest impressions of old age. It had been before remarked by some, that he would die of old age before he arrived at thirty; and in fact, by the time he was twenty-two, he could scarcely walk a hundred paces, being worn out with the multiplicity of his years, and bent under the burden of a protracted life. In this year he died. A cold, attended with a slight fever, threw him into a kind of lethargy, which had a few momentary intervals; but he could scarcely be brought to speak. However, it is asserted, that in the five last years of his life he showed a clearer understanding than in his times of best health; but at last he died, after enduring great agonies, in the twenty-second year of his age."

A learned physician presented, in 1809, a paper to the Royal Society, describing the preserved body of a pigmy which he had examined in the West Indies, the property of a Frenchman, who pretended that he brought the man living from Madagascar, where a whole nation existed of men and women varying from thirty-two to forty inches high. Their manners and customs were also described; but the whole depended on the veracity of the Frenchman, who appeared in a questionable character. In short, since the above period no trace whatever has been discovered of this wonderful race of people.

* Polyphemus, the son of Neptune, a huge and cruel monster, with only one eye in the middle of his forehead, which Ulysses destroyed with a firebrand.

† Galatea, the daughter of Nereus and Doris, passionately loved by Polyphemus.

‡ The poet's mistress.

BIOGRAPHIC SKETCHES.

MUNGO PARK.

Second Article.

For some time after his marriage, and before he set out on his expedition, Mr Park appears to have been quite undecided as to his future prospects in life; and perhaps the comparative independence of his circumstances, from the profits of his publication, and the remuneration he obtained from the African Association, rendered him somewhat indifferent to any immediate permanent settlement. But it was likewise strongly suspected by his intimate friends, that he entertained hopes of being soon called upon to undertake another mission to the Niger, although he kept perfectly silent on the subject. Amongst those who suspected him of this design was his friend Mr Walter Scott, who states that he drew this inference from the following seemingly trifling incident:—Happening to call one day on his friend, at Fowlshiels, he was told that he had walked out, and Mr Scott accordingly proceeded on foot up the banks of the Yarrow, Park's native stream, in hopes of meeting with him. The channel of the river is here very rocky and uneven, occasioning many deep pools and eddies in its course; and, in rounding a corner of the bank, Mr Scott suddenly came upon him, standing on the brink of one of these pools, engaged in throwing large stones into it, and earnestly watching the bubbles that rose to the surface of the water. After observing him for some time, Mr Scott joined him, and asked the reason of his pursuing this singular amusement; upon which Park replied, that this was the plan he adopted for determining the depth of the rivers in Africa—judging of their shallowness or profundity by the time which the bubbles took to ascend, after the immersion of the stone. "From this moment," says the narrator, "I had no doubt of his having a second exploratory expedition in contemplation." As time, however, continued to elapse, without any such proposition from the expected quarter being made, Mr Park perceived the imprudence of any longer remaining in idleness, and, in 1801, removed to Peebles, where he commenced practice as a surgeon. But it would appear he was not very successful in this speculation; and this fact, together with the natural restlessness of his disposition, seems to have rendered his situation peculiarly irksome to him. In answer to a friend, who suspected his design of again proceeding abroad, and earnestly remonstrated with him against it, he writes, "that a few inglorious winters of practice at Peebles was a risk as great, and would tend as effectually to shorten life, as the journey he was about to undertake." In the meantime, his *ennui*, or impatience, was much relieved by the enjoyment of the best society in the neighbourhood, and by being honoured with the friendship of many of the most distinguished literary characters in Scotland at that time. Amongst these were the venerable Dr Adam Fergusson, then resident at Hallyards, near Peebles; Colonel Murray of Cringletie, father of the present Lord Cringletie; and Professor Dugald Stewart. As before mentioned, too, a strong intimacy sprung up between our traveller and the celebrated Author of Waverley, then but little known in the literary world, and who resided with his family at Ashiestiel, on the banks of the Tweed. This friendship commenced in 1804, after Mr Park had removed from Peebles to Fowlshiels, and was, as suspected, actually preparing for his second expedition to Africa, of which he had then privately got intimation. It is pleasing to know the cordiality and affectionate familiarity which subsisted between these celebrated men, and also that it arose from a marked congeniality in their tastes and habits.* Park was an enthusiastic lover of poetry, especially the minstrelsy with which his native district was rife; and although he made no pretensions to the laurel crown himself, he occasionally gave expression to his feelings and thoughts in verse, even from his earliest years. It was little wonder, then, that he should own a particular predilection for the society of one whose heart and memory was so richly stored with the ancient ballad lore of his country, although his reserve towards strangers in general, which was carried even to a repulsive degree, was notorious. In particular, Sir Walter has noticed the strong aversion of his friend to being questioned in a promiscuous company on the subject of his adventures, of which grievance, as may be imagined, he had frequent cause to complain. Their last parting has been described by the former in strong and affecting terms. Mr Park paid him a farewell visit at Ashiestiel, where he remained during the night; and, next morning, Sir Walter *convoyed* him (according to the vernacular phrase) part of the way back to Fowlshiels, over the wild chain of pastoral hills that divide the Tweed from the Yarrow. Park talked much of his intended expedition, and stated his determination of going straight to Edinburgh, to avoid the pain of a formal parting from his wife and family. The two friends were then on the top of William-hope ridge, and the autumnal mist, which floated slowly and heavily down the valley,

* It chanced that they were born within a month of each other.

presented to the poet's imagination a striking emblem of the troubled and uncertain prospect of his friend's undertaking. As it was contemplated that Park should be accompanied, in his expedition through the interior of Africa, by a small military force, Scott strongly remonstrated against this plan, as impolitic and dangerous—inefficient to protect him from attack, yet large enough to excite ill-will and suspicion. Mr Park combated these objections, by describing the divided and disorganised condition of the numerous petty kingdoms of Africa, which rendered a combined movement against him unlikely; as also the custom of travellers and caravans of all nations being allowed to travel through their territories on paying a small duty. This interesting conversation occupied the friends till they came to a point of the moor where they had previously agreed to separate, and where a small ditch divided the moor from the road. In going over this ditch, Mr Park's horse stumbled, and nearly fell. "I am afraid, Mungo," said Scott, "that is a bad omen;" to which Park replied, smiling, "*Freits* (*i. e.* omens) follow them that freits follow;" and with this proverbial expression, implying that a superstitious anticipation is apt to bring on its own catastrophe, he put spurs to his horse, as if afraid of a formal leave-taking, and was speedily out of sight.

The new mission to Africa, which was now sanctioned and promoted by government, had been projected so far back as 1801; but owing to changes in the ministry, and other causes of delay, the preparations for it were not completed till 1805. Mr Park parted from his family in the way he had fixed on, and proceeded to London with his brother-in-law Mr James Anderson, who, as well as Mr Scott, an artist, had resolved to accompany him in his expedition. On this occasion, Mr Park received the brevet commission of captain in Africa, and a similar commission of lieutenant to his relative Mr Anderson. Mr Scott also was employed by government to accompany the expedition as draughtsman. Mr Park was, at the same time, empowered to enlist soldiers from the garrison of the island of Goree, to the number of forty-five, to accompany him in his journey; and the sum of L.5000 was placed at his disposal, together with directions as to his route, &c. The expedition sailed from Portsmouth on the 30th January 1806, and arrived at Pisania on the 28th of April, where preparations were immediately made for the inland journey. The party consisted of forty men, two lieutenants, a draughtsman (Mr Scott), and Park himself; they had horses for themselves, and asses for carrying the provisions and merchandise. Mr Park wrote to several friends at home, previous to setting out, in the highest spirits, and seemingly perfectly confident of success. In his letter to Mr Dickson, he says, "this day six weeks, I expect to drink all your healths in the Niger;" and again, "I have little doubt but that I shall be able, with presents and fair words, to pass through the country to the Niger; and if once we are fairly afloat, *the day is won*." Alas! how sadly these sanguine expressions contrast with the melancholy issue of the expedition. Park's chance of reaching the Niger in safety depended mainly upon his doing so previous to the commencement of the rainy season, which is always most fatal to Europeans; but scarcely had they got half way when the rain set in, and the effect on the health of the men was as speedy as disastrous. They were seized with vomiting, sickness, dysentery, and delirium; some died on the road, others were drowned in the rivers, and several were left in the precarious charge of the natives in the villages. Some, still more unfortunate, were lost in the woods, where they would inevitably be devoured by wild beasts; while the native banditti, who imagined the caravan to contain immense wealth, hung upon their march, and plundered them at every opportunity. In crossing the Wondu, they nearly lost their guide Isaaco, by a large crocodile, which pulled him below the water several times, but from which he at last got free, much lacerated. At another time they were encountered by three large lions, but which took to flight at the sound of Mr Park's musket. At last the miserable remnant of the party—only nine out of forty-four, and these nine all sick, and some in a state of mental derangement—reached Bambakoo, on the Niger. Here Mr Scott was left behind on account of sickness, where he shortly died; while the rest proceeded to Sego, the capital of Bambarra, which they reached on the 19th of September. Mansong was still king, and was so highly gratified with the presents brought to him, that he gave them permission to build a boat, and promised to protect them as far as lay in his power. Mr Park forthwith opened a shop for the sale of his European goods, which immediately obtained such demand, that his shop was crowded with customers from morning till night, and one day he turned over no less than 25,756 cowries. Here, however, he lost his brother-in-law Mr Anderson, a circumstance which afflicted him greatly, and made him feel, as he himself expressed it, "as if left a second time lonely and friendless amidst the wilds of Africa." But not all the sufferings he had undergone, the loss of his companions, or the dismal condition of the remainder, and the perilousness of his situation—nothing could damp the native ardour of his mind. Having got a sort of schooner constructed and rigged out, he prepared for setting out on his formidable journey, previous to which, however, he took care to bring his journal up to the latest hour, and wrote several letters to his friends and relatives in Britain. These were entrusted to his faithful guide Isaaco, to carry back to the Gambia, whence they were transmitted to England. His letter to Mrs Park, excepting that part of it which mentions the death of her brother and Mr Scott, was written in a cheering and hopeful strain; speaks with confidence of his reaching the ocean in safety, and of the probability of his being in England before the letter itself! His companions were now reduced to four, viz., Lieutenant Martyn and three soldiers, one of whom was deranged in his mind; and with this miserable remnant, and a guide named Amadi Fatouma, he set sail, as near as could be ascertained, on the 19th of November 1806. The progress of the unfortunate travellers after this period, and their ultimate fate, so long a mystery, must now be familiar to all our readers, although there are many circumstances attending the unhappy closing scene which are yet shrouded in doubt and uncertainty.

Vague rumours of the death of Park and his companions were brought by some of the natives to the British settlements on the coast, even so early as the end of 1806; but no information could be got for several years of a nature to be at all relied on, during which time the suspense of his friends and of the public at large, but more particularly of his afflicted family, was of the most painful nature. At length, in 1810, Colonel Maxwell, governor of Senegal, dispatched Isaaco, Park's former guide, into the interior, in order to ascertain the truth or falsehood of the reports which prevailed. After an absence of a year and eight months, this individual returned, and the main facts of the narrative, which he gave as the result of his labours, are not only but too probable in themselves, but seem to have been thoroughly confirmed by the investigations of subsequent travellers. Isaaco stated, that he had fallen in with Mr Park's guide, Amadi Fatouma, at Medina, near Sansanding, who, on seeing Isaaco, and hearing the name of Park, began to weep, saying, "they are all dead;" and was with great difficulty induced to detail the melancholy circumstances of the catastrophe. The account which he gave is too long to be introduced entire here, but the substance of it was as follows:—After leaving Sansanding, Mr Park navigated his way down the Niger, as far as Boosa, in the kingdom of Yaour, which was more than two-thirds of the distance towards the ocean, or Gulf of Guinea, and where the river is termed by the natives *Quorra*. They had frequent skirmishes with the natives, particularly in passing Tombuctoo, where several of the natives were killed. On reaching Yaour, Mr Park sent Amadi Fatouma ashore with various presents, some of which were to the chief or governor of the place, but the most valuable portion for the king, to whom the chief was requested to send them. A short while after, the latter sent to inquire if Mr Park intended to come back; and on being answered that he could return no more, the treacherous chief appropriated the presents intended for the king to his own use. This piece of knavery proved fatal to the unfortunate travellers. The king, indignant at the supposed slight cast on him, assembled a large army at the above-mentioned village of Boussa, where a large high rock stretches across the whole breadth of the river, the only passage for the river being through an opening in the rock in the form of a door. The army posted themselves on the top of the rock, and, on Mr Park's attempting to pass, assailed him with lances, pikes, arrows, stones, and missiles of every description. The beleaguered travellers defended themselves for a long time, until all were either killed or severely wounded; when, seeing the uselessness of further resistance, Mr Park, Lieutenant Martyn, and one or two more, jumped out of the boat, and were drowned in attempting to get ashore. Only one slave was left alive. Such was the narrative of Amadi Fatouma, who had left Mr Park at Yaour, where his engagement with him terminated, and where he was for many months afterwards confined in irons on suspicion of having purloined the presents intended for the king, which had been made away with by the treacherous chief. Amadi had obtained the accounts of the fatal scene from those who had taken a part in it. The natives afterwards endeavoured to account for the disappearance of Park, to the inquiries of subsequent travellers, by saying that his vessel had foundered against the rock, and that he and his companions were drowned by accident. But there is now not the shadow of a doubt that the above narrative of Amadi is substantially true.

So perished Mungo Park, in the thirty-fifth year of his age—a man whose natural enthusiasm, scientific acquirements, undaunted intrepidity, patience of suffering, and inflexible perseverance, in short, every quality requisite for a traveller in the path he adopted, have never been surpassed, and who, had he survived, would no doubt have reaped those laurels which more fortunate successors in the same career have won. To these qualities in his public character, it is pleasing to be able to add those of amiable simplicity of manners, constancy of affection, and sterling integrity in private life.

Mr Park's papers were, with the exception of a few scraps,* unfortunately all lost with him, and this is much to be regretted, as, notwithstanding the late important discoveries of the Landers, who have traced the course of the Quorra or Niger from Boussa, where Park fell, down to the Gulf of Guinea, they were unable to explore a great part of that immense portion of it which flows between Boussa and Tombuctoo, and which Park must of necessity have navigated. Their united labours have, however, solved the grand problem which has engaged the attention of all civilized nations from the earliest ages to which history leads us back; and there seems little cause for doubt, that, in a short time, the still broken links in the great chain of communication with the centre of Africa will be united. What prospects to commerce, science, and, above all, to the cause of Christianity, does not the attainment of this object open up!

* These were, an old nautical publication (of which the title-page was amissing, and its contents chiefly tables of logarithms), with a few loose memoranda of no importance between the leaves. One of these papers, however, was curious enough, from the situation and circumstances in which it was found. It was a card of invitation to dinner, and was in the following terms:—

"Mr and Mrs Watson would be happy to have the pleasure of Mr Park's company at dinner on Tuesday next, at half past five o'clock. An answer is requested.

"Strand, 9th Nov. 1804."

These were the only written documents belonging to Park which the Messrs Landers, after the most anxious inquiries and investigations, were able to discover. They succeeded, however, in recovering his double-barrelled gun, and the tobe, or short cloak, which he wore when he was drowned.

THE MODERN JEWS.

FIRST ARTICLE.

The Jewish nation, as well as the Jewish books, may be considered, both in their nature and in their history, as perfectly unique, presenting a wonderful phenomenon in the annals of the human race. Their origin in a single family—their residence in Egypt, and going forth from thence—their wandering forty years in the wilderness—their wars in Canaan, and settlement there—as well as their miseries at different times—are all circumstances worthy of admiration, and such as are recorded of no other nation under heaven. Nor is the history of the modern Jews much less surprising than that of their ancestors. Their rejection of the Messiah—the destruction of their chief city and temple by the Romans—and their subsequent dispersion among different nations—together with the dreadful persecutions and calamities which have there befallen them at different times—form a very important and interesting chapter. This branch of history we do not mean to enter fully upon at present, but shall merely bring forward a few observations regarding the customs, opinions, and religious observances of the Jews in their present state.

"The famous Benjamin of Tudel," says the author of the Philosophy of History, "a very learned Rabbin, who travelled in Europe and Asia in the twelfth century, computed that there were 380,000 Jews of the ancient tribes assembled under one sovereign. The Jews never had any country to themselves since the time of Vespasian, except some hamlets of Arabia Felix towards the Red Sea. Mahomet was at first obliged to keep terms with them; but he at length destroyed the little dominion which they had established in the north of Mecca. It is from the time of Mahomet that they have ceased to compose a body of people."

The fertility of Palestine in ancient times, as well as the crowded population which it is said to have supported when possessed by the Jewish people, are circumstances which have caused a good deal of wonder to travellers who have visited those regions in modern times. The country was called Palestine, from the Philistines, who inhabited a great part of it. It got also the name of the Land of Promise, from its having been long promised to the children of Abraham before they obtained actual possession of it. The name of Judea is derived from the tribe of Judah, who inhabited the most pleasant and fertile portion, and because the royal authority was placed in that tribe. It was also denominated the Holy Land, because it was selected by Jehovah for a habitation to his favoured people—for a place where to record his name, and establish his church.

The veneration of the Jews for this celebrated region led them to consider it as the centre of the globe, and situated in the heart of all nations. They call it, in Hebrew, the centre of the world, and the beauty of all lands. A ridge of high hills separated it from Edom, or Idumea, upon the south. The river Jordan, the lake Asphaltites, or sea of Sodom, and the sea of Tiberias, formed the eastern boundary. Upon the north, it was separated from Phœnicia by the mountain Anti-Libanus; and the western coast was washed by the gentle waves of the Mediterranean. It extended about two hundred miles in length, and eighty in breadth.

Moses describes this inheritance of Abraham's sons as "a land that flowed with milk and honey; as a

country of brooks of water, of fountains, and depths that spring out of vallies and hills; a land of wheat, and barley, and vines, and fig-trees, and pomegranates; a land of oil-olive and honey; a land where there is no lack of any thing; whose rocks are iron, and out of whose hills thou mayest dig brass." The modern traveller, who has formed his conceptions of the Holy Land from such a description, is quite disappointed on entering this celebrated country. He beholds the general surface irregular and rugged, presenting to his view, in some places, naked rocks and steep precipices, intersected every where by ridges of mountains, abounding in woods and marked with deserts. From its general appearance and contracted limits, he is apt to question the accuracy of the account of its ancient fertility and population. It will readily be granted that the appearance of this country since the destruction of Jerusalem—the extirpation of the Jews—the devastations of the Turks—and the continual depredations of the Arabs—bears no resemblance to its ancient splendour. But, on the same principles, we would reject the accounts of ancient history concerning the prosperity and splendour of Assyria, Babylon, Egypt, Tyre, Greece, Carthage, Syracuse, and the islands of Asia Minor, all of which are situated in the same part of the world, and have experienced a similar declension.

The celebrated traveller Maundrell, speaking on this subject, remarks as follows:—"It is obvious for any one to observe that these rocks and hills (of Palestine) must have been anciently covered with earth, and cultivated, and made to contribute to the maintenance of the inhabitants no less than if the country had been all plain. Nay, perhaps much more; forasmuch as such a mountainous and uneven surface affords a larger space of ground for cultivation than this country would amount to if it were all reduced to a perfect level. For the husbanding of these mountains, their manner was to gather up the stones, and place them in several lines along the sides of the hills, in form of a wall. By such borders they supported the mould from tumbling or being washed down, and formed many beds of excellent soil, rising gradually one above another, from the bottom to the top of the mountains. Of this form of culture you see evident vestiges wherever you go in all the mountains of *Palestine*. Thus the very rocks were made fruitful. And, perhaps, there is no spot of ground in this whole land that was not formerly improved, to the production of something or other ministering to the sustenance of human life."*

In different parts of the mountains of Palestine, a very different temperature prevails. Hence the expression of the Arabian poets, that "the mountain Sennir bears winter on his head, spring upon his shoulders, and autumn in his bosom, while summer lies sleeping at his feet."

In addition to what has been remarked by Maundrell, and other modern travellers, it ought to be remembered that the history of mankind affords numerous instances in which natural obstacles have been removed, and an enlightened and vigorous policy, seconded by fortunate circumstances and national industry, have diffused fertility among barren wilds, and crowded the desert with population. Besides, the soil of Palestine was naturally fertile, required little or no manure, and could be cultivated by means of a small plough and a single yoke of oxen; each inhabitant was lord of his own little possession, endeared to him as the family inheritance—which circumstances all united to stimulate his industry, and contributed to augment the riches of nature, as well as to multiply the enjoyments of man.

The want of good government, and the consequent depression of industry, must, therefore, be looked upon as the chief, if not the only causes of the deplorable state of Palestine in modern times. "A very affecting idea of the state of society in this country," says Mr Cook, who travelled there in 1824, "may be formed from the fact, that the husbandmen and others carry fire-arms with them wherever they go. Our muleteer had a musket, and the Greek pedlar a cutlass and pistols. Every man you meet would serve a painter as the model for an assassin."—"The town of Acre," says the same traveller, "has a beautiful appearance when seen from a short distance. The palm-trees, which are more numerous here than in either of the towns I had hitherto seen, give it quite an oriental appearance. One of the mosques has a lofty minaret. There is a Turkish burial-ground on the side of the road, near the town. Flowers were planted on most of the graves. I was detained at Acre, waiting for my letter of protection, till eight o'clock. We continued our road over the sands about three hours, when we crossed some hills, which may be considered as a part of Mount Carmel, and entered upon a country which, though wild and uncultivated, is possessed of great richness and beauty. We passed considerable encampment of herdsmen, with very large flocks of sheep and herds of kine.

"In the impression produced on me by the great beauty of the country through which we were travelling, I could not help saying to the Jew, 'What a beautiful country God has reserved for your nation.' 'Yes,' said he, 'when we shall become good enough to merit it.'"

The population of Palestine in ancient times corresponded to its fertility. In the days of David, when he commanded Joab to number the people, there were of the Israelites 800,000 fighting men, and of the single tribe of Judah 500,000: and, upon the supposition that this was a third part of the inhabitants, their number would amount to nearly four millions, or 550 inhabitants to a square mile, as Major Rennel has computed the extent of Palestine to be 7250 square miles. The population seems to have reached its maximum during the peaceful and prosperous days of Solomon, when it is said, "Judah and Israel *were* many, as the sand which is by the sea, in multitude, eating and drinking, and making merry. And Judah and Israel dwelt safely, every man under his vine and under his fig-tree, from Dan even to Beersheba, all the days of Solomon."* Now, if they amounted to four millions in the time of David, as is calculated, we shall certainly be justified in estimating them at *five millions* during their maximum, in the days of Solomon; and this is nearly the number of the Jews in the world at present, according to the most accurate estimate that can be made. This circumstance wonderfully illustrates what is said by the Prophet Amos, in regard to the dispersion of this people over the world—"Behold, the eyes of the Lord Jehovah *are* upon the sinful kingdom, and I will destroy it from off the face of the land; saving that I will not utterly destroy the house of Jacob, saith Jehovah. For lo, I will command, and I will sift the house of Israel among all nations, like as corn is sifted in a sieve, yet shall not the least grain fall upon the earth."†

There is a particular circumstance in the history of the Jews, and very worthy of notice, viz. their great proneness to idolatry before the Babylonish captivity, and their entire abandoning of it ever after that time. The true reason why the Jews were so prone to idolatry before the Babylonish captivity, and so cautious, nay, superstitiously fixed against it ever after, according to Prideaux, appears plainly to be this, that they had the law and the prophets read to them every week, in their synagogues, after the captivity, which they had not before: for they had no synagogues till after that period. That this was the case, Prideaux considers as certain, from the circumstance of there being but few copies of the law extant in Judea before the time of the captivity, which could not have happened if synagogues had then existed. "And it is most probable," says he, "that Ezra's reading to them the law, and the necessity which thereon they perceived there was of having it oftener read among them, for their instruction in it, gave them the occasion of erecting synagogues after the captivity."‡ Some are of opinion, however, that it must have been during the captivity that the Jews, having no temple, began to build these *places of assembly*, for that is what the Greek word *synagogue* signifies, for prayer and instruction in the law.

The *synagogues*, therefore, are sacred places, set apart for prayer and instruction. With relation to the former of these purposes, they were sometimes called *oratories*: and the Greek word by which these are designated in the New Testament, signifies both *prayer* and the *place of prayer*. The synagogues have no certain form; but they have each of them an altar, or rather table, upon which the Book of the Law is spread. At the east side there is a cupboard or chest, called *Aron*, i. e. *the ark*, in which the holy book, or Roll of the Law, called the *Torah*, is kept; and there are generally a great many lamps hung to the ceiling. The seats of the synagogues are so placed that the people always sit with their faces towards the elders, and the place where the law is kept; and the elders sit with their backs to this chest or ark, and their faces to the people. These places are *the chief seats in the synagogues*, which the Pharisees sought after, and for which our Lord condemns them. The women are separated from the men, in a chamber, which joining to the synagogue, they can from thence hear and see what is done.

There were several of these *places of assembly* in every city of the Holy Land, and they reckoned up to the number of 480 of them in Jerusalem; which number was necessary for that prodigious multitude of Jews, who were obliged to come thither three times a-year, to worship God in the Temple. Of these synagogues, some were peculiar to the Jews of every country, and of every condition. Thus we find mention is made, in the Acts of the Apostles, of the synagogue of the *Freedmen* and of the *Alexandrians*.§

§ Acts vii. 9.

CURIOUS EXAMINATION OF A SCOTCH WITNESS BEFORE A JURY.

The following examination, which took place in a question tried in 1817, in the Jury Court, between the Trustees on the Kinghorn Passage and the town of Kirkaldy, affords a striking proof of that *caution* which is held to be a prominent feature in the character of a Scotchman.

The witness was called on the part of the trustees, and apparently full of their interest. The counsel having heard that the man had got a present of a coat from the clerk to the trustees before coming to attend the trial, thought proper to interrogate him on that point; as, by proving this, it would have the effect of completely setting aside his testimony. The examination is as follows:—

Q. Pray, where did you get that coat?—The witness (looking obliquely down on the sleeve of his coat, and from thence to the counsel), with a mixture of effrontery and confusion, exclaimed—A. Coat, coat, Sir! Whare gat I that coat?

Q. I wish to know where you got that coat?—A. May be ye ken whare I got it.

Q. No; but we wish to know from whom you got it?—A. Did ye gi'e me that coat?

Q. Tell the jury where you got that coat?—A. What's your business wi' that?

Q. It is material that you tell the court where you got the coat?—A. 'Am no obliged to tell about ma coat.

Q. Do you not recollect whether you bought that coat, or whether it was given to you?—A. I canna recollect every thing about ma coats—whan I get them, or whare I get them.

Q. You said you remembered perfectly well about the boats 42 years ago, and the people that lived at Kirkaldy then, and John More's boat; and can you not recollect where you got that coat you have on at present?—A. 'Am no gaun to say ony thing about coats.

Q. Did Mr Douglas, clerk to the trustees, give you that coat?—A. How do you ken ony thing about that?

Q. I ask you, did Mr Douglas, clerk to the trustees, give you that coat?—A. 'Am no bound to answer that question, but merely to tell the truth.

Q. So you wont tell where you got that coat?—A. I didna get the coat to do ony thing wrang for't; I didna engage to say ony thing that was na true.

The Lord Chief Commissioner, when the witness was going out of the box, called him back, and observed, "the court wish to know from you something farther about this coat. It is not believed or suspected that you got it improperly or dishonestly, or that there is any reason for your concealing it. You may have been disinclined to speak about it, thinking that there was something of insult or reproach in the question put from the bar. You must be sensible that the bench can have no such intention; and it is for your credit, and the sake of your testimony, to disclose fairly where you got it. There may be discredit in concealing, but none in telling where you got it."

Q. Where did you get the coat?—A. 'Am no obliged to tell about ma coat.

Q. True, you are not obliged to tell where you got it, but it is for your own credit to tell.—A. I didna come here to tell about coats, but to tell about boats and pinnaces.

Q. If you do not tell, I must throw aside your evidence altogether.—A. 'Am no gaun to say ony thing about ma coat;—'am no obliged to say ony thing about it.

Witness went away, and was called back by Lord Gillies.

Q. How long have you had that coat?—A. I dinna ken how lang I hae had ma coat. I hae plenty o' coats. I dinna mind about this coat or that coat.

Q. Do you remember any thing near the time: have you had it a year, a month, or a week? Have you had it a week?—A. Hoot, ay, I dare say I may.

Q. Have you had it a month?—A. I dinna ken; I cam' here to speak about boats, and no about coats.

Q. Did you buy the coat?—A. I dinna mind what coat I bought, or what coat I got.

The consequence was, that their lordships were forced to reject the evidence of this witness.—*Scots Magazine*, 1817.

BEER.

Beer was first brewed in England about the year 1492; in Scotland it had been known ten years earlier. By a statute of James the First, one full quart of the best beer or ale was to be sold for one penny, and two quarts of small beer (better than some ale now-a-days) for a penny.

ANIMAL MAGNETISM.

[The Editors of the Journal beg to direct particular attention this week to their Popular Information on Science. The article under that head is of an uncommonly interesting nature, and is intended to be followed up in the ensuing number.]

The present number of the Journal completes a quarter, for which payment was generally received from subscribers in town the Publishers respectfully notify, that, in the course of the ensuing week, receipts for the next quarterly payment will be sent to the houses of the subscribers, and that it would be conferring a particular favour, and save much trouble, if payment were made when called for. It would, perhaps, be most convenient for both parties, in order to prevent the possible necessity of a second application, that the subscribers (if they wish to continue the Journal) should leave the small sum required with their servants.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS. EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 72. SATURDAY, JUNE 15, 1833. PRICE THREE HALFPENCE.

THE WATCHMAKER.

By the Ettrick Shepherd.

David Dryburgh was the head watchmaker in the old burgh of Caverton, and a very good watchmaker he was; at least I never knew one who could better make a charge, and draw out a neat and specious bill. Every watch that went to him to clean required a new mainspring at least, and often new jewels for pivots to the fly-wheel, or a new chain or hairspring; or, if the owner had a very simple look, his watch needed all these together.

But experience teacheth fools wisdom. David, for all his good workmanship and handsome charges, never had one sixpence to polish another; so, after due consideration, he said to himself one day, "This will never do! I must have a wife! There is no respectability to be obtained in this world without a wife! No riches, no comfort, without a wife! I'll have one, if there is one to be had in this town for love or money. Money! God bless the mark! I'll not have a lady. No, no; I'll not have a lady; I never could find out what these creatures called ladies were made for. It could not be for mothers of families, for not one of them can nurse a child; and it is a queer thing if our Maker made so many handsome elegant creatures just to strum upon a piano, eat fine meat, an' wear braw claes. No, no! Before I married a lady, I would rather marry a tinkler. I'll marry Peg Ketchen. She can put a hand to every thing; and if any body can lay by something for a sore foot or a rainy day, I think Peg's that woman. I'll ask Peg. If she refuse, I have no less than I have."

David went that very evening, and opened his mind to Peg Ketchen. "Peg, I have taken it into my head to have a wife to keep me decent, sober, and respectable, and I'm going to make you the first offer."

"Thank you, sir; I'm singularly obliged to you. Only you may save yourself the trouble of making such an offer to me; for of all characters, a confirmed drunkard is the one that I dread most. You are a Sabbath-breaker; I know that. You are a profane swearer; I know that also. From these I think I could wean you; but a habitual drunkard it is out of the power of woman or man to reclaim. Oh, I would not be buckled to such a man for the world! As lang as Will Dunlop, or Jamie Inglis, or John Cheap, needed a dram, your last penny would go for it."

"It is ower true you say, Peg, my bonny woman. But ye ken I can work weel, an' charge fully as weel; an' gin ye were to take the management o' the *proceeds*, as the writers ca't, I think things wad do better. Therefore, take a walk into the country with me on Sunday."

"Did ever ony leevin' hear the like o' that! preserve us a' to do weel an' right; the man's a heathen, an', I declare, just rinnin' to the deil wi' his een open. Wad ye hae me to profane the Sabbath-day, gaun rakin' athwart the country wi' a chap like you? Heigh-wow! I wad be come to a low mete then! What wad the auld wives be sayin' to the lads an' I were to do that? I can tell you what they wad be sayin', 'What think ye o' your bonny Peg Ketchen now? When she should hae been at the kirk, like a decent lass, serving her Maker, she has been awa' flirtin' the hale Sunday wi' a drunken profligate, wha bilkit his auld uncle, an' sang himsel' hame frae London wi' a tied-up leg, like a broken sailor.' Ha, ha, Davie! I ken ye, lad."

"Now, you are rather too hard on me, Peg; I am proffering you the greatest honour I have in my power to bestow."

"The greatest *dishonour*, you mean."

"You know I am as good a tradesman as is in Scotland."

"The mair's the pity! And wha's the best drinker i' Scotland? For it will lie atween you an' John Henderson and Will Dunlop; for, as for Tam Stalker, he's no ance to be compared wi' you."

"But, Peg, my woman—my dear, bonny woman—hear me speak, will you?"

"No, no, David, I winna hear ye speak; sae dinna try to lead me into a scrape, for I tell you again, as I tauld ye already, that of a' characters i' the warld a confirmed drunkard is the most dangerous that a virtuous young woman can be connectit wi'. Depend on it, the heat o' your throat will soon burn the claes aff your back; an' how soon wad it burn them off mine too!—for, ye ken, a woman's claes are muckle easier brunt than a man's. Sae, gang your ways to the changehouse, an' tak a dram wi' Will Dunlop; ye'll be a great deal the better o't. An', hear ye, dinna come ony mair to deave me wi' your love, and your offers o' marriage; for, there's my hand, I sall never court or marry wi' you. I hae mair respect for mysel' than that comes to."

Was not Peg a sensible girl? I think she was. I still think she must naturally have been a shrewd girl; but no living can calculate what a woman will do when a man comes in the question. There is a feeling of dependence and subordination about their guileless hearts, in reference to the other sex, that can be wound up to any thing, either evil or good. Peg was obliged to marry David, after all her virtuous resolutions. The very night of the wedding he got drunk; and poor Peg, seeing what she had brought herself to, looked in his face with the most pitiful expression, while his drunken cronies made game of him, and were endless in their jests on "Benedict the married man." Peg saw the scrape she had brought herself into, but retreat was impracticable: so she resolved to submit to her fate with patience and resignation, and to make the most of a bad bargain that she could.

And a bad bargain she has had of it, poor woman, apparently having lost all heart several years ago, and submitted, along with three children, to pine out life in want and wretchedness. The wedding booze increased David's thirst so materially, that it did not subside, night or day, for nearly a fortnight, until a kind remonstrance, mixed with many tears, from his young wife, made him resolve to turn over a new leaf. So away David went into the country, and cleaned all the people's clocks early in the morning before the owners rose, for fear of making confusion or disturbance in the house afterwards:—David was very attentive and obliging that way. Of course the clocks got nothing more than a little oil on the principal wheels; but the charge was always fair and reasonable, seldom exceeding five shillings. Then all the bells in each house required new cranks and new wires. They needed neither, but only a little oil and scrubbing up; but these were a source of considerable emolument. Then he gathered in all the watches of the country which were not going well, cleaned them all, and put in a great many nominal mainsprings, and really would have made a great deal of money, had it not been for the petty changehouses, not one of which he could go by; and when he met with a drouthy crony like Captain Palmer, neither of them would rise while they had a sixpence between them.

But the parish minister of the old burgh of Cavernot, though accounted a very parsimonious gentleman himself, had a sincere regard for the welfare of his flock, temporal as well as spiritual; and in his annual visit he charged every one of them, that, when David did any work for them, they were to pay the wife, and not him. The greater part of them acquiesced; but Wattie Henderson refused, and said, "O, poor soul, ye dinna ken what he has to thole! Ye ken about his drinkin', but ye ken little thing about his drouth."

The shifts that David was now put to for whisky, were often very degrading, but still rather amusing. One day he and Dunlop went in to Mr Mercer's inn, David saying, "I must try to get credit for a Hawick gill or two here to-day, else we'll both perish." They went in, and called for the whisky. Mercer asked David if he had the money to pay for it? David confessed that he had not, but said Mr Elliot of Dodhope was owing him three-and-sixpence, and as he was in the town that day, he would give him an order on him, if he was afraid of the money coming through his hands. Mr Mercer said he would never desire a better creditor than Gideon, and gave them their three gills of whisky; but on going and presenting his order to Mr Elliot, he found that he had never, in his life, been owing David any thing which he had not paid before he left the house.

Another time he met the clergyman, and said to him, "You have been a great deal of money out of my pouch, sir, wi' your grand moral advices. I think you owe me one-and-sixpence about yon bells—would it be convenient to pay me to-day? I have very much need of it."

"And what are you going to do with it, David? I wish I were owing you ten times the sum; I should know whom to pay it to, for you have a wife and family that are worth looking after; but if you tell me the sterling truth of your necessity, perhaps I may pay you."

"Why, the truth is, sir—look yonder: yonder is Will Dunlop and Jamie Inglis, standing wi' their backs against the wa', very drouthy like. I wad like to gie them something, poor chiels, to drink."

"Now, David, as I am convinced you have told me the sterling truth, and as there is no virtue I value higher, there is your eighteen-pence, although I shall tax myself with the payment of it a second time to Peg."

"God bless you, sir!—God bless you! and may you never want a glass of whisky when you are longing as much for it as I am."

Another day he came up with Will Dunlop, and said, "O man, what hae ye on ye? for I'm just spitting sixpences."

"I have just eighteen-pence," said Dunlop, "which I got from my wife to buy a shoulder of mutton for our dinner; and as it is of her own winning, I dare not part with it, for then, you know, the family would want their dinner."

"It is a hard case any way," said David; "but I think the hardest side of it is, for two men, dying of thirst, to lose that eighteen-pence. Give it to me, and I'll try to make a shift."

Dunlop gave it him, and David went away to Wattie Henderson, an honest, good-natured, simple man, and said that his wife had sent him "for a shoulder of mutton for their dinner, and she has limited me to a sum, you see (showing him the money). If you have a shoulder that suits the price, I must have it."

"We can easily manage that, David," said he; "for see, here is a good cleaver; I can either add or diminish." He cut off a shoulder. "It is too heavy for the money, David; it comes to two-and-four-pence."

"I wad like to hae the shoulder keepit hale, sir, as I suspect my sister is to dine with us to-day. Will you just allow me to carry the mutton over to the

foot of the wynd, and see if Peg be pleased to advance the rest of the price?"

"Certainly," said Mr Henderson; "I can trust your wife with any thing."

David set straight off with the shoulder of mutton to Mrs Dunlop, who declared that she had never got such a good bargain in the flesh-market before; and the two friends enjoyed their three gills of whisky exceedingly. Mr Henderson, wondering that neither the mutton nor the money was returned, sent over a servant to inquire about the matter. Poor Peg had neither ordered nor received the shoulder of mutton; and all that she and her three children had to dine upon, was six potatoes.

"Poor fellow," said Wattie, "if I had kend he had been sae dry, I wad hae wat his whistle to him without ony cheatery."

At length there came one very warm September, and the thirst that some men suffered was not to be borne. David felt that in a short time his body would actually break into chinks with sheer drought, and that some shift was positively required to keep body and soul together. Luckily, at that very time a Colonel Maxwell came to the house of John Fairgrieve, an honest, decent man, who had made a good deal of money by care and parsimony, and lived within two or three miles of Caverton. The colonel came with his dog, his double-barrelled gun, and livery servant, and bargained with John, at a prodigiously high board, for himself and servant. He said, as his liberty of shooting lay all around there, he did not care how much board he paid for a few weeks, only John was to be sure to get them the best in the country, both to eat and drink. He did so—laying in wine and spirits, beef and mutton; and the colonel and his servant lived at heck and manger, the one boozing away in the room, and the other in the kitchen, in both of which every one who entered was treated liberally. In the forenoons the colonel thundered among the partridges; but he never killed any, as he was generally drunk from morning to night, and from night to morning.

At length, John's daughter, Joan, a comely and sensible girl, began rather to smell a rat; and she says to her father one day, "Father, dinna ye think this grand cornel o' your's is hardly sickan a polished gentlemanly man as ane wad expect o' ane o' his rank?"

"I dinna ken, Joan; the man's weel eneuch if he wadna swear sae whiles, whilk I like unco ill. But there's ae thing that's ayont my comprehension: I wish he may be cannie; for dinna ye hear that our cock begins to craw every night about midnight, an' our hens to cackle as gin they war a' layin' eggs thegither, an' the feint an egg's amang them a'?"

Joan could not repress a laugh; so she turned her back, and took a hearty one, saying, when she recovered her breath, "I think baith master an' man are very uncivil and worthless chaps."

"If either the ane or the ither hae been unceevil to you, my woman, just tell me sae. Say but the word, an' I'll ——"

"Na, na, father; dinna get intil a passion for naething. I'll take care o' *my*sel', if ye can but take care o' *your*sel'. It is that that I'm put till't about. Dinna ye think that for a' your outlay ye're unco lang o' fingerin' ony o' their siller?"

John gave a hitch up with his shoulder, as if something had been biting it, rubbed his elbow, and then said, "The siller will answer us as weel when it comes a' in a slump thegither; for then, ye ken, we can pop it into the bank; whereas, if it were coming in every day, or even every week, we might be mootering it away, spending it on this thing an' the ither thing."

"Yes, father; but, consider, if ye shoudna get it ava. Is nae the cornel's chaise an' horses standin' ower at the Blue Bell?"

"Ay, that they are, an' at ten shillings a-day, too. Gin the cornel warna a very rich man, could he afford to pay that sae lang, think ye?"

"Weel, father, take ye my advice. Gang away ower to Mr Mather, o' the Bell, an' just see what the carriage an' horses are like; for I wadna wonder if ye had to arreest them yet for your expenses. Mr Mather's a gayen auld-farrant chap, and, it is said, kens every man's character the first time he hears him speak. He'll tell you at aince what kind o' man your grand cornel is. And by a' means, father, tak a good look o' the carriage an' the horses, that ye may ken them again, like."

John knew that his daughter Joan was a shrewd sensible lassie; so, without more expostulation, he put on his Sunday clothes, went away to the old burgh of Caverton, and called on Mr Mather. No! there were no carriage nor horses there belonging to a Colonel Maxwell, nor ever had been. This was rather astounding news to John; but what astounded him more was a twinkling blink from the wick of Mr Mather's wicked black eye, and an ominous shake of his head. "Pray tell me this, John," said Mr Mather: "does this grand colonel of yours ever crow like a cock, or cackle like a laying hen?"

John's jaws fell down. "It's verra extrordner how ye should hae chanced to speer that question at me, sir," said he; "for the truth is, that, sin' ever that man came to our house, our cock has begun a crawin' at midnight, an' a' our hens a-cackling, as the hale o' them had been layin' eggs, an' yet no an egg amang them a'."

"Ah, John, ye may drink to your expenses and board-wages, then; for I heard of a certain gentleman being amissing out of this town for a while past; and I likewise heard that he had borrowed a hunting-jacket, a dog, and a gun, from John Henderson."

John went away home in very great wrath, resolved, I believe, to throttle the colonel and his servant both; but they had been watching his motions that day, and never returned to his house more, neither to crow like cocks, cackle like hens, drink whisky, or pay for their board and lodging."

Tom Brown was very angry at David about this, and reproved him severely for taking in an honest industrious old man. "But, dear, man, what could a body do?" said David. "A man canna dee for thirst if there's ony thing to be had to drink either for love or money."

"But you should have wrought for your drink yoursel', David."

"Wrought for my drink? An' what at, pray? A' the house bells were gaun janglin' on, like broken pots, in their usual way; there wasna even the mainspring of a watch wanting. And as for the clocks, they just went on, tick-for-tick, tick-for-tick, with the most tedious and provoking monotony. I couldna think of a man, in the whole country, who didna ken my face, but John; an' I kend he was as able to keep me a wee while as ony other body. An' what's the great matter? I'll clean his watch an' his clock to him as lang as he lives, an' never charge him ony thing, gin it be nae a new mainspring whiles, an' we'll maybe come nearly equal again."

The last time I saw Peg Ketchen—what a change! From one of the sprightliest girls in the whole country, she is grown one of the most tawdry, miserable-looking objects. There is a hopeless dejection in her looks, which I never saw equalled; and I am afraid, that, sometimes when she has it in her power, she may take a glass herself, and even get a basting, for no man can calculate what a drunken man will do.

Now, though I have mixed two characters together in these genuine and true sketches, my reason for thus publishing them is to warn and charge every virtuous maiden, whatever she does, never to wed with a habitual drunkard. A virtuous woman may reclaim a husband from almost every vice but that; but that will grow upon him to his dying day; and if she outlive him, he will leave her a penniless and helpless widow. It is well known the veneration I have for the fair sex, and I leave them this charge as a legacy, lest I should not be able to address them again.

LITERARY HISTORY OF THE BIBLE.

THE APOCRYPHA.

Having given an account of the origin and literary characteristics of the accredited and usually accepted books composing the Old and New Testament, we now proceed to offer a few details relative to those books styled the Apocrypha, a branch of the subject possessed of considerable interest, and which we shall treat in the same measure of impartiality.

The term *Apocrypha* is Greek, signifying *hidden* or *concealed*, and is used to designate a number of books, often placed between the Old and New Testament, or otherwise bound up with them. Some writers divide the sacred books into three classes, viz., the canonical, the ecclesiastical, and the apocryphal. In the first, they place those whose authority has never been questioned in the Catholic or Universal Church; in the second, those which were not received at first, but which were nevertheless read in the public assemblies, as books that were useful, though they never placed them upon the same footing of authority as the former; and in the third, they placed the books which were of no authority, which could not be made to appear in public, but were kept *hidden*, and were, therefore, called *apocryphal*, that is, *concealed*, or such as could not be used in public. "Let us lay aside those books which have been called *apocryphal*," says St Augustine, "because their authors were not known to our fathers, who have, by a constant and certain succession, transmitted down to us the authority and truth of the Holy Scriptures. Though some things in these apocryphal books are true, yet as there are in them multitudes of others which are false, they are of no authority."

The Apocrypha consists of *fourteen* books, viz. First and Second Esdras, Tobit, Judith, the rest of the chapters of the Book of Esther, the Wisdom of Solomon, Ecclesiasticus, Baruch, the Song of the Three Holy Children, the History of Susanna, the Story of Bel and the Dragon, the Prayer of Manasses, and the First and Second Book of the Maccabees. Every attentive reader must perceive that these books want the majesty of inspired scripture; and that there are in them a variety of things wicked, false, and disagreeing with the oracles of God. None of them were ever found in the proper Hebrew tongue; and they were never received into the canon of scripture by the Jews, to whom the oracles of God were originally committed. They were partly read in private by the ancient Christians, as useful; but they did not admit them into the canon of Scripture. None of them are found in the catalogue of the canonical books by Melita, bishop of Sardis, in the second century; nor does Origen in the third, or Epiphanius in the fourth, in the least acknowledge their authenticity. One or two of the writers of them, also, ask pardon if they have said any thing amiss; which clearly shows that they were not inspired, or at least did not consider themselves to be so: and, therefore, these books can by no means be considered as having a title to form part of the word of God. A very simple analysis of the books themselves will be sufficient to demonstrate this to every attentive mind.

I. It is not known at what time the First Book of Esdras was written, neither is it known who was the author of it; but Prideaux considers it certain that he wrote before the time of Josephus. It was originally to be found only in Greek; and in the Alexandrian manuscript it is placed before the canonical Book of Ezra, and is there called the First Book of Ezra, because the events related in it occurred prior to the return from the Babylonish captivity. In some editions of the Septuagint, it is called the *First Book of the Priest* (meaning Ezra), the authentic book of Ezra being called the second book. In the editions of the Latin vulgate, previous to the Council of Trent, this and the following book are styled the Third and Fourth Books of Esdras, those of Ezra and Nehemiah being entitled the first and second books. This book is chiefly historical, giving an account of the return of the Jews from the Babylonish captivity, the building of the temple, and the re-establishment of divine worship. It is, in fact, nothing but a bad extract of the two last chapters of Chronicles, and the Book of Ezra; and, in a great many instances, it even contradicts these. The author falsely makes Zorobabel a young man in the days of Darius Hystaspes, and Joakim to be his son; whereas he was the son of Joshua, the high priest. He calls Darius king of Assyria, long after that empire was utterly dissolved; and makes some things to be done under Darius which were done under Cyrus.

II. The author of the Second Book of Esdras is likewise unknown. It is supposed to have been originally written in Greek, though the original of it has never been found but in Latin; and there is an Arabic version, differing very materially from it, and having many interpolations. Although the writer personates Ezra, it is manifest, from the style and contents of his book, that he lived long after that celebrated Jewish reformer. He pretends to visions and revelations, but they are so fanciful, indigested, ridiculous, and absurd, that it is clear the Holy Spirit could have no concern in the dictating of them. He believed that the day of judgment was at hand, and that the souls of good and wicked men would all be then delivered out of hell. A great many rabbinical fables occur in this book, particularly the account of the six days' creation, and the story of Behemoth, or Enoch, as it is here called, and Leviathan—two monstrous creatures that are designed as a feast for the elect after the day of resurrection, &c. He says that the ten tribes are gone away into a country which he calls Arsareth, and that Ezra restored the whole body of the Scriptures which had been entirely lost. He also speaks of Jesus Christ and his Apostles in so clear a manner, that the gospel itself is scarcely more explicit. On these accounts, and from the numerous traces of the language of the New Testament, and especially of the Revelation of St John, which are discoverable in this book, several critics have concluded that it was written about the close of the first century, by some converted Jew, who assumed the name of Esdras or Ezra.

III. The Book of Tobit, from the simplicity of the narrative, and the lessons of piety and meekness which it contains, has been always one of the most popular of the apocryphal writings. It was first written in Chaldee by some Babylonian Jew; but there is no authentic information as to his name, or the time when he flourished. It professes to relate the history of Tobit and his family, who were carried into captivity to Nineveh by Shalmanezer, being first begun by Tobit, then continued by his son Tobias, and, lastly, finished by some other of the family, and afterwards digested by the Chaldee author into that form in which we now have it. The time of this history ends with the destruction of Nineveh, about 612 years before Christ; but most commentators and critics agree in thinking that the book itself was not written till about 150 or 200 years before Christ. It has been generally looked upon, both by Jews and Christians, as a genuine and true history; but it contains so many rabbinical fictions, and allusions to the Babylonian demonology, that it is much more rational to suppose the whole book an entire fable. It is not probable, that, in the time of Sennacherib and Esarhaddon, the father should live, as is here said, 158 years, and the son 127. It is certain no angel of God could falsely call himself *Azarias, the son of Ananias*, as this writer affirms. The story of Sarah's seven husbands being successively killed on their marriage-night by an evil spirit, and of that spirit's being driven away by the smell and smoke of the roasted heart and liver of a fish, and bound in the uttermost parts of Egypt, or of the angel Raphael's presenting to God the prayers of the saints, with other matters evidently fabulous, are quite sufficient to justify the rejecting of this book entirely from the sacred canon, upon the score of internal evidence alone.

IV. The Book of Judith professes to relate the defeat of the Assyrians by the Jews, through the instrumentality of their countrywoman of this name, who craftily cut off the head of Holofernes, the Assyrian general. This book was originally written in Chaldee by some Jew of Babylon, and was thence translated by St Jerome into the Latin tongue. Dr Prideaux refers this history to the time of Manasseh, king of Judah; Jahn assigns it to the age of the Maccabees, and thinks it was written to animate the Jews against the Syrians; but so many geographical, historical, and chronological difficulties attend this book, that Luther, Grotius, and other eminent critics, have considered it rather as a drama or parable than a real history. It has been received into the canon of Scripture by some as being all true; but, on the other hand, it is the opinion of Grotius that it is entirely a parabolical fiction, written in the time of Antiochus Epiphanes, when he came into Judea to raise a persecution against the Jewish church, and that the design of it was to confirm the Jews under that persecution, in their hope that God would send a deliverer. According to him, by Judith is meant Judea, which, at the time of this persecution, was like a desolate widow: that her sword means the prayers of the saints: that by Bethulia, the name of the town which was attacked, is meant the temple, or the house of the Lord, which is called in Hebrew *Bethel*. Nabuchodonosor denotes the devil, and the kingdom of Assyria the devil's kingdom, pride. Holofernes, whose name signifies a *minister of the serpent*, means Antiochus Epiphanes, who was the devil's instrument in that persecution, &c. &c. It is plain, that, in this way, by means of a little ingenuity, any thing may be made of any thing; and such conjectures as these, as an able commentator remarks, however ingenious, are better calculated to exhibit the powers of fancy and the abuse of learning, than to investigate truth, or throw light on what is uncertain and obscure. The noted deliverance mentioned in this book is there said to have happened after the Jews had returned from their captivity, and had rebuilt the temple, and yet it is said to have been in the eighteenth year of Nebuchadnezzar, which is absurd; and it is said that they had no trouble for *eighty* years or more after this deliverance, which is equally absurd, as the Jews, during any period of their history, or, indeed, any other nation, never enjoyed a peace of such long continuance. It is quite improbable that a small town, as Bethulia is here represented to be, should stand out against so powerful an army, or that the death of the general should have made all the troops betake themselves to a shameful flight. It is certainly wrong, as is done in the case of Judith, to commend a woman as a devout fearer of the Lord, who was guilty of notorious lying, of acting the part of a bawd, of profane swearing, of murder, and of speaking in praise of that committed by the patriarch Simeon, whom she claims as her ancestor.

V. "The rest of the chapters of the Book of Esther, which are found neither in the Hebrew nor in the Chaldee," were originally written in Greek, whence they were translated into Latin, and formed part of the Italic or old Latin version in use before the time of Jerome. Being there annexed to the canonical Book of Esther, they passed without censure, but were rejected by Jerome in his version, because he confined himself to the Hebrew Scriptures, and these chapters never were extant in the Hebrew language. They are evidently the production of a Hellenistic Jew, but are considered both by Jerome and Grotius as a work of pure fiction, which was annexed to the canonical book by way of embellishment. From the coincidence between some of these apocryphal chapters and Josephus, it has been supposed that they are a compilation from the Jewish historian; and this conjecture is further confirmed by the mention of Ptolemy and Cleopatra, who lived but a short time before Josephus. These additions to the Book of Esther are often cited by the fathers of the church; and the Council of Trent has assigned them a place among the canonical books.*

The author of these apocryphal chapters says many things that are in direct contradiction to the inspired historian; as when he affirms that the attempt made by the eunuchs to take away the life of Ahasuerus was in the second year of his reign; that Mordecai was at the very time rewarded for his discovery; that Haman had been advanced before this event, and was provoked with Mordecai for his discovery of the eunuchs; that Haman was a Macedonian, and intended to transfer the government of Persia to the Macedonians. He very stupidly, also, represents Ahasuerus looking upon Esther, *as a fierce lion*, and yet *with a countenance full of grace!* and as calling the Jews *the children of the most high and most mighty living God;* and as ordering the heathens to keep the feast of Purim.

VI. The book of "The Wisdom of Solomon" was never written by that monarch, as its author falsely pretends, for it was never extant in Hebrew, nor received into the Jewish canon of Scripture, nor is the style like that of Solomon. It consists of two parts: the first, which is written in the name of Solomon, contains a description or encomium of wisdom, by which comprehensive term the ancient Jews understood prudence and foresight, knowledge and understanding, and, especially, the duties of religion and morality. This division includes the first ten chapters. The second part, comprising the rest of the book, treats on a variety of topics widely differing from the subject of the first, viz., reflections on the history and conduct of the Israelites during their journeyings in the wilderness, and their subsequent proneness to idolatry. Hence the author takes occason to inveigh against idolatry, the origin of which he investigates, and concludes with reflections on the history of the people of God. His allegorical interpretations of the Pentateuch, and the precept which he gives to worship God before the rising of the sun, have induced some critics to think that the author was of the Jewish sect called Essenes.

Although the fathers of the church, and particularly Jerome, uniformly considered this book as apocryphal, yet they recommended the perusal of it, in consideration of the excellence of its style. The third Council of Carthage, held in the year 397, pronounced it to be a canonical book, under the name of *the Fourth Book of Solomon*, and the famous Council of Trent confirmed this decision. Jerome informs us that several writers of the first three centuries ascribed the authorship of it to Philo the Jew, a native of Alexandria who flourished in the first century; and this opinion is generally adopted by the moderns, on account of the Platonic notions that are discoverable in it, as well as from its general style, which evidently shows that it was the production of a Hellenistic Jew of Alexandria. Drusius, indeed, attributes it to another Philo, more ancient than the person just mentioned, and who is cited by Josephus; but this hypothesis is untenable, because the author of the Book of Wisdom was confessedly either a Jew or a heretical Christian, whereas the Philo mentioned by Drusius was a heathen.

It is quite evident that this author had read Plato, and the Greek poets; and he employs a great many expressions taken from them, such as Ambrosia, the river of forgetfulness; the kingdom of Pluto, &c.; as also several words borrowed from the Grecian games, which were not in use till long after the time of Solomon, whose name he assumes. A great many of his phrases seem to be taken out of the Prophets, and even from the New Testament. There are numerous passages in the book evidently borrowed from the Prophecies of Isaiah and Jeremiah; particularly in the 13th chapter, where there are no less than nine verses plainly copied from the 44th chapter of Isaiah.

This author brings forward many things that are contrary both to the words of inspiration and to common sense. He condemns the marriage-bed as sinful, and also excludes bastards from the hopes of salvation: he talks as if souls were lodged in bodies according to their former merits; makes the murder of Abel the cause of the flood; represents the Egyptians as being plagued entirely by their own idols, that is to say, by the beasts which they worshipped; though it is certain they never worshipped *frogs*, *locusts*, or *lice*. He also calls the divine *Logos*, or second person of the Trinity, *a vapour* or *steam*, with many other things that are evidently absurd.

* Vide Horne's Introduction to the Scripture, vol. iv. p. 220.

AMUSEMENTS AT MARGATE.

Margate, as a bathing-place, might be imagined a retired spot, to which invalids resorted for the benefit of their health, and therefore conclude it presented one vast hospital or receptacle of human misery. Far otherwise. There are persons who admire the salubrity of the air, and the kindness of the towns-people. There are also many who think bathing may prove serviceable to them—many who delight in opportunity for care-killing—many whose happiness consists in escaping from a chrysalis state in London, to flutter a butterfly at Margate. To these is the place indebted for the visits of nearly 100,000 persons in the course of a season. There was, in time past, a superior class of visitors; but as their heels were touched by the toes of others considered inferior, the strawberry leaved and the balled coronetted took offence, and vanished. There are, however, three descriptions of persons who retain partialities for Margate. The first consists of families, respectable in every sense of the term; they have houses or lodgings in the squares, or best parts of the town; their amusements and their domestic comforts are united with judgment, and can only be alluded to, as examples to others; they are the affluent merchants and tradesmen of the metropolis, being, *par excellence*, vulgarly denominated *carriage company*. Another description of persons rent houses, or lodgings, less expensive, and regulate their establishments on principles of economy and respectability, regularly dealing with those most worthy their commands. These are select in their intimacies, enjoying all the amusements of the place unostentatiously, and in many respects approximating to the *carriage class*, but not of it—therefore may be called the *horse and gig company*. A third description, for the purposes of distinction only, may be called the *foot company*, composed of persons who, knowing the few holidays that can be snatched from their occupations ought to be agreeably spent, rush down to Margate with a determination to be happy. A boarding-house is their place of rendezvous. Among these may be found many highly cultivated persons.

Ladies ever form a considerable part of boarding-house society; and as they are induced to appear in their best visiting amiability, they produce a corresponding attention to decorum on the part of the gentlemen, which provokes in either the ambition to appear to more than the greatest advantage. Of course every young gentleman is well bred, wealthy, intimate with those who move in the upper circles, frequents the opera and other superior amusements in London. He is therefore prepared to indulge in all the vanities of Margate. Yet, however hyperbole may operate, geese are not swans, nor will conceit or falsehood transform a magpie into a bird of paradise. It is certain that persons cannot make themselves beautiful, if their features be ordinary, nor change a malformation into the first order of fine forms; but they might be candid, and perhaps become intelligent: these are practicable, but unfortunately not fashionable. Therefore, when Jessamy and Flippet meet, a scene of flattery and delusion commences, which, as if by mutual agreement, they determine never to check, or detect, until their marriage has taken place. Then they appear like two celebrated pedestrians who agreed to go a great distance in company. A toll-bridge lay in their road, each believing the other had cash; but neither being provided, they were brought to a stand-still, and the match was off. But to the boarding-house inmates: the meals are announced by jingling a large bell in the passage or hall. At these meetings parties are made. The precious souls, agog to dash through thick and thin, propose a ride to Ferry Grove—a trip to Pegwell-bay—a sail to the Reculvers—a stroll on the Parade—a walk on the Pier, or on the Jetty. Yes; this is most inviting.

The Pier is a stone building with a lighthouse at the extremity, projecting in a slight curve 900 feet into the sea, forming a shelter to vessels within the harbour, which is dry at low water. On an elevated part of the Pier there is a pleasant promenade, for the enjoyment of the sea-breeze and the prospects, in perfect security. A little to the east is the Jetty, a platform constructed of oak, projecting in a straight line 1120 feet out to sea. There are openings between each plank to lessen the action of the rising tides, as at high water the whole is covered. At the extremity is a circular part, a little elevated, the delight of the lovers of mischief. On this, when the tide is rising, large parties assemble; the attention of the ladies is directed to distant objects, or to any thing by which they may be detained till the tide has flowed up to the lower portion of the open planking of the platform; the initiated steal away; the others feel they must hasten over these openings, through which, if the water be the least agitated, a direction of the spray upwards occasions some unpleasant sensations, besides proving that silk stockings are not fishermen's boots. All this the spectators vociferously enjoy. The more timid are often carried over these jet d'eaux by the gentlemen, at which the laugh is not lessened, while the most alarmed are fetched from their situation of increasing danger by the boatmen, whose charge for rescuing such damsels in distress is sixpence each. All this cannot be otherwise than exceedingly amusing, since the same ladies have endured it several times, affording proof positive that whatever is, is right—that all is charming and delectable at enchanting Margate.

Then comes the jaunt to Ramsgate. A string of open carriages waits. After due bedizening with streamers long and gay, off they whirl; the sun, despite of parasol, scorching them, and the dust from the chalky roads suffocating them. Refreshment becomes necessary as air to breath. After partaking sumptuously, finding the heat allayed, and the thirst relieved, the party walk on the Pier, where the refracted heat of a summer's sun is so oppressive as often to occasion languor and fainting. But true heart ne'er tires: they enjoy all that can be enjoyed, and return enraptured with the excursion. After such exertions, who would not enjoy a refreshing sleep?—sleep that seems to cast into oblivion every recollection, save those the most agreeable; for day after day succeeds, in which similar extravaganzas are enacted. Then come the concerts! They must be attended for the sake of harmony and love of melody. Thus evenings are occupied in listening while a singer endeavours to recover a few lost notes. Occasionally they parade up and down the concert room to martial music—the steps of the marchers and the time in the orchestra being now and then together. Yet all is charming! They can see and be seen—no heart aches unless the little urchin Cupid may have been practising his archery. Then there are the libraries! It is impossible not to be a subscriber, although a book be never opened, because it confers a right to squeeze in to hear Mr and Miss Somebody hoot and squeak, if permitted by the rafflers with their dice-boxes and loud announcings of the numbers required to be filled—"Only three and two and five—five, three and two—five—five!" This is reiterated so frequently and so loud, that it is advisable to be provided with cotton to preserve the drum of the ear. The proper number of names having been written against the numbers of the raffle for one shilling each, the parties in turn throw with the dice. The highest

in three throws being declared the winner, a ticket is presented to the *fortunate* individual. All this hallooing and rattling is repeated again and again at two or three places in the room, forming a part of the entertainment more astonishing than delighting. Let it not be forgotten, that at Betteson's library the performer at the grand piano-forte executes, with great taste and expression, some of the best modern music, without being attended to as it deserves, amid the uproar of mountebank trickery. Yet all this is delightful and highly entertaining Some of the *fortunates* at the dice-box will become possessed of a great number of tickets, for which, at their departure, the amount may be received in trinketry or trumpery. Nevertheless, all is beautiful and excellent. Criticism at Margate would be considered a fish out of his element. Every lure is set, every trap is baited, to catch the contents of the Cockney's purse. Step into the bazaars, they appear as if the Boulevards of Paris had emptied all their fiddle-faddles, sweet scents, and nonsense, to attract. Oh, how pretty! Something must be purchased, or some chances in the lottery must be taken. One of the *prizes*, an elegant work-box, worth——it is invaluable! It may be gained. The wheel of fortune turns—A blank! No matter—all is right, all is cheerful. It is a dull heart that never rejoices. The next attempt may be successful. Then there are the gardens—once shady grove, then Tivoli, now any thing—plenty of fever-cooling refreshments—plenty of charges—plenty of foolery and fire-works, rivalling the giant fool at Vauxhall. Yet how rural, how enchanting! How sweet to walk home by moonlight, and to hear the *soft* whisperings during that walk. How ecstatic! Mortals hardly ever know the joys that await them. All is most delicious Then there is the public breakfast at St Peter's. Oh the lovely spot!—the concentration of all that is captivating. Who can refrain? All must go, unless they chance to be eaten up by hypochondria. How shall they go! Oh, dear variety!—ever stimulating charm! On donkies to be sure. What can be so entertaining?—so full of pleasurable ideas, the climax of all that is frolicsome. Away goes the porter to collect all the donkies possible, not less than a dozen. Here they are, and the ladies are ready. How exhilarating! There is a spring, an elasticity of heart, that would persuade the party they were not of earthly mould. The ladies mount their long-eared palfreys, decorated with saddle-cloths of sixpenny cotton and twopenny fringe. The gentlemen, like knights at a tournament, kiss their hands, and are greeted with smiles and laughter at each other till they can hardly retain their seats. The ladies have but *half a page* each—the whole page's business is to trot in the rear of two ladies, chaunting, "Come up, Neddy," with a chorus of whacks on the crupper. The accompanying knights having permitted their chargers to walk between their legs, drop into their seats heroically. Off they all go in chivalry taste, save that regularity of cavalcade is entirely neglected, some preferring the slowest pace, as best adapted to the retention of seat—others choosing the utmost speed, as best calculated to display skill in the menage. Crossing the fields, they are irresistibly comical in their widely scattered groups, and in their shouts of laughter and screams of mirth at one or more of the party measuring their lengths on the ground. Not having far to fall, renders a recurrence less terrible, however disagreeable, since every one may not fall like Julius Cæsar. They arrive at St Peter's, all save one fair damsel, whose palfrey preferred grazing on the blooming clover to forming any part of the array, which determination the fair rider had no power to oppose. "Where is she—where is her page?" "Oh! he came with Miss Thingame, and there he goes for the other lady. See where she sits like patience on a monument. How cruel to have left her thus! Why did not her Neddy come up? But see where she comes to bless us, blushing like a peony"—every eye fixed on her strange movement, caused by the velocity with which the page urged her palfrey. Fortunately no bottles were in her pockets. She dismounts, weary of being a heroine. Tea is ordered, with all the etcetera of a sumptuous breakfast, during which it is resolved not to return by the same means. They had no idea of encountering the gaze, and being subjected to the animadversions of so many; therefore the pages must be sent home to direct that carriages for the party may be sent from Margate by such a time. The stirring bands of music invite to the covered dancing-place. They must walk and quadrille a little, although it is so warm. They do so—the little goes on till it assumes the evidences of being much, and they retire exhausted, like so many red lions, to some of the alcoves to recover themselves; during which, the gentlemen will not have taken more than three jellies each, although the practice is so exceedingly fashionable. The carriages come; the excitement being over, they return to dress for dinner. The recollections of the outrageous publicity of their excursion, with the evidences of their fatigue, produce only simpers, and an endeavour to affix the most ridiculous occurrences on each other. Much of mimicry, burlesque, and hyperbole, is ventured in good humour, and mirthfully retaliated. Amid the conviviality, additional bottles of wine make their appearance, which, like Charles of Spain's shoes, were not prime, but such as might be used. All goes on well—the ladies retire—the gentlemen take another glass or two—talk politics, and, in their superior knowledge of legislation, jurisprudence, and political economy, prove beyond contradiction that the Chancellor of the Exchequer is a noodle, and the Premier a doodle. After this, the well-informed disputants are advised to walk under the cliffs, where they splash each other to their heart's content. Some go to smoke half-a-dozen cigars, only because it is fashionable; thence to quiz the girls on the Jetty; others look in at the billiard-table, where there are, or soon will be, players who can always make a hard game of it till the stake is worthy notice, and then—"It don't signify." Then there is the *Theatre Royal*, where Melpomene and Thalia exchange the powers over which they should preside, and, except when a star from one of the metropolitan hemispheres appears, there is darkness visible, serving only to discover sights too insipid to give pleasure, or not contemptible enough to provoke laughter. Yet even here there is novelty. The strumming and scraping of three persons in the orchestra of an empty theatre, produces a strange effect on the ear, which cannot be described. After a few slapping of box-doors, very loud yawning in the pit, and whistling in the gallery, the curtain rises. The strutting and fretting proceeds. Friends in the dress circle shake hands with each other across the pit, and the act is over. The ladies agitate, and peep through their fans—Charming! Every particular of Mrs and Miss ——'s decorations can be scrutinised and descanted upon. Urling's lace! Mina nova and paste! Birmingham jewellery! Good gracious, what sagacity to be enabled to point this out! What talent to compare things with those of which they are only the representative! It produces such an enthusiastic delirium, that the play is forgotten in a revelry of impatience, and they do not stay to witness the farce! In such a round of folly do some, at other times thinking persons, beguile hours, weeks, and months, till a whisper from home, weariness, or exhausted funds, like a gun in a field covered with birds, puts them on the wing by hundreds, and the principal of the boarding-house is left to preside at a deserted table.

To persons of sedentary habits, or whose years place them out of the pale of boarding-house follies, Margate presents much that is satisfactory. The walk along the cliffs to Kingsgate—to Birchington—to many villages in the vicinity, in sight of the ocean—any of the before-mentioned attractions may be enjoyed, free of frivolity and treble expense, by the prudent.

There are many bathing machines, tepid and vapour baths, properly constructed and attended to. Seabathing is good under particular circumstances, taken by the advice of medical experience; but ducking is no panacea. The proprietors of the bathing places have discovered to their cost that persons do not come to Margate to play Tritons and Mermaids, as they did a few years since.

The charges for board and lodging, where both are good, are about two guineas per week—wine, spirits, or ale, exclusive. There are stage-coaches to Canterbury, Ramsgate, and Dover, daily. There is no doubt that the Londoners will long retain a partiality for Margate.

MISCELLANEA.

WIT.—A professed wit musters his jokes on parade every morning as a general does his veterans, to ascertain how many may have been disabled by length of service.

DESTRUCTION OF LISBON.—You see what man is, when never so little within the verge of matter and motion in a ferment. The affair of Lisbon has made men tremble, as well as the Continent shake, from one end of Europe to another; from Gibraltar to the Highlands of Scotland. To suppose these desolations the scourge of heaven for human impieties, is a dreadful reflection; and yet to suppose ourselves in a forlorn and fatherless world, is ten times a more frightful consideration. In the first case, we may reasonably hope to avoid our destruction by the amendment of our manners; in the latter, we are kept incessantly alarmed by the blind rage of warring elements. The relation of the captain of a vessel to the Admiralty, as Mr Yorke told me the story, has something very striking in it. He lay off Lisbon, on this fatal first of November, preparing to hoist sail for England; he looked towards the city in the morning, which gave the promise of a fine day, and saw that proud metropolis rise above the waves, flourishing in wealth and plenty, and founded on a rock that promised a poet's eternity—at least to its grandeur; he looked an hour after, and saw the city involved in flames, and sinking in thunder.—*Warburton's Letters.*

AMASIS.—Amasis, a man of humble origin, was the favourite, and afterwards the successor of Apries, king of Egypt. Finding himself somewhat despised by the people, on account of his mean extraction, he hit upon the method of curing their folly. He caused a golden basin, in which he used to wash his feet, to be converted into the statue of a god, and had it set up in a conspicuous part of the capital. The superstitious multitude flocked to worship it. Amasis now told them, that the subject of their veneration had once been nothing but a vile utensil; "and," said he, "it is the same with me; I was formerly a humble individual—I am now your king. Take care, therefore, to respect me, according to the station I now hold."

"MIGHT, COULD, WOULD, OR SHOULD."

IT is known, or ought to be known, to all persons, that there are two departments in a common verb, called the Indicative and the Subjunctive Moods. When we imply that a thing is done, was done, or will be done, we speak in the *indicative*—that is, we indicate or simply notify some transaction of which we are enabled to speak with the confidence arising from exact knowledge. But when we mean to say that such and such a thing may be done, or might be done, or will have been done when a certain other thing permits—when we speak, in short, in "if's and an's," or in a faint hesitating way, as if we did not like to come to the point—then we are using the *subjunctive mood*, which is so called because some condition is always supposed to be *subjoined* to the act of which we are speaking. In this latter mood there is a tense called the pluperfect, which is used when we say that any one might, could, would, or should have done any kind of thing.

Now, this pluperfect tense of the subjunctive mood, this "might, could, would, or should," is a grievous bore, insomuch that we could almost wish it to be drummed out of the English grammar altogether. It is something like intentions, as contrasted, in a late number of our paper, with deeds, frequently supplanting an honest and useful indicative, and, with not the tenth part of the merit of that respectable mood, carrying off all the glory due to it alone. People have a way of saying that a man of words and not of deeds is like a garden full of weeds; but this principle is in reality very imperfectly acknowledged or acted upon. We may have a kind of abstract notion that deeds are better than words; yet did we, for our own part, never see, when the actual deeds of one man were contrasted with those which we suppose *might have been done* by another—when all that one friend has been honestly able to do was measured against what we expect from some other who has only been talking of doing it—we never saw, we say, that the former got any fair degree of credit, compared with what was gratuitously bestowed upon the latter. The Subjunctive generally carries it hollow from the Indicative—the measure of the reason in the one case being apparently no match for the measure of the imagination in the other. This is certainly a most discouraging thing for the gentlemen who *do*, and ought to be put a stop to in this and every other well-regulated state. It is really too bad, when one takes the trouble to act upon the indicative in every thing, that the honour due to him should be carried off by the lazy gentlemen of the subjunctive, who insolently tell us that they could if they had a mind, and whom we slavishly hold up as able to do any thing, merely because we have never yet had any specimen of their abilities whereby to judge more correctly.

Every class of persons, we believe, could recite the injuries they have suffered in this way—for let any person on earth do his very best, ay, perhaps the very best that *could* be done, there will be some other body, who, from merely holding his peace, and perhaps looking a little grave, is generally believed to be able to do a great deal better. This greatness in the subjunctive is a pest every where. It rules the court, the camp, the grove. Perhaps, however, it is nowhere so rife as in literature—that is to say, if a thing can be said to be in literature, which, it is only supposed, might, could, would, or should be in literature. Be it understood, anyhow, that there is a class of gentlemen, of good education or otherwise, who, though they never be detected in so much as a letter in a local newspaper signed Civis, being merely suspected of literary habits, and having a rather plausible way of pronouncing upon things, get far more credit among all who know them, than almost any existing author who comes plump down with his half-dozen volumes in the year, thereby affording the whole community a means of judging of his pretensions. If you speak of any well-known author, a certain degree of merit is acknowledged; but "ah, sir," ten to one this is added, "he is nothing to our acquaintance H——; there's a fellow for you—never would publish any thing though—great loss to the world—*he* is the man!" Now, in all probability, H—— is nothing but a heavy proser, who never felt the least impulse of the diviner kind of mind all his days; but what is that? There is nothing known against him. Every body is safe in praising *him*, for he has given out no specimen of his ingenuity to pick exceptions with, and the person whom you are endeavouring to inspire with as great a fallacy as yourself, must just take it in and

make the best of it. Very different it is when you speak of an indicative man; you must cruise with some caution there, or you will be met in the teeth, perhaps, with a declaration that he whom you admire is a goose—a sentence which cannot but be accepted as reflecting equal discredit upon the admirer and the admired. It is this that gives such a secure celebrity to the gentlemen of the subjunctive.

There is one other department of human life in which we have observed this most unrighteous *mood* to have particular sway. Our readers may have observed, that, when any gentleman takes a wife, all his friends are a good deal concerned to know whether his choice be really a worthy one or not. If it be supposed inferior—and almost all matches are thought to be so in *some* respects, on either the one side or the other, or on both—then it is lamented, and the gentleman is thought to have been so far a fool. On the other hand, there are some men who seem so excessively fastidious, have such delicate and lofty notions about the sex, and linger, and consider, and look about them so long, that they almost seem as if they were too good for marriage under any circumstances. Oh, thinks every body, a man of such taste, such discernment, and who has so many advantages to bring to the matrimonial state—what a choice he must make! Mark here how the subjunctive rises triumphant above the indicative—how *may take a wife* shines pre-eminent over *has taken a wife!* Ten to one, however, it is all gratuitous folly, arising from our propensity to make the creatures of the imagination brighter and more golden than the creatures of our optics. We compare the human, and therefore frail, being, whom the indicative man has made his wife, with the faultless monster whom we think alone proper for the subjunctive, and, as a matter of course, the subjunctive gets the preference. Wait, however, till Mr Subjunctive has at last—for there is no enduring perfection on earth—condescended to assume the indicative; wait till he, too, some day take a wife. Then, alas, does he suffer as Mr Indicative formerly suffered. His choice is found, like every other body's, to be liable to some exceptions, greater or less; and, like the god who was thrown from heaven upon the earth, and was crippled by the fall, he is not only taken down from his former high character, but he is made rather shabbier than he would naturally be, in consequence of the declension.

The moral of all this must have been already so fully perceived by our readers, that it will not require to be more than touched upon. Away, we say, with all *supposed* merit—away with all greatness of which we can only say that it *might, could, would,* or *should* be! Such flattery of the indolent or the incapable—for both of these kinds of people are objects of it—is a direct robbery of the active and the ingenious, and must be alike injurious to public and to private interests. The public may depend upon it, that the express tendency of any thing that is *in* a man, is to come *out,* and that the simplest inference that can be made from *nothing coming out,* is, that *nothing is in.* That part, for instance, of the human race, who sit for hours in a company and never open their lips, are not thus silent from the magnitude of their ideas finding, as it were, the aperture of expression too narrow, or the audience unworthy of their exertions. In general they are neither more nor less than idealess men. We have heard of one who once sat in a company of his brother agriculturists, in the house of the original of Dandie Dinmont, till three o'clock in the morning, without ever saying one word till that last moment, when, it being urged by most of the company that the bowl, already seventeen times replenished, should be replenished no more, he burst out with—"Od, I think we wadna be the werr [worse] o' another ane." Now, it is evident that this speech, luminous and eloquent as it partly was, could be the result of nothing but the singular emergency of the occasion—the imminent fear of losing hold of the liquor to which his soul was glued—the great, the overmastering love of "another bowl." So is it always with these silent horrors, as a clever but somewhat talkative friend of ours terms them, and also with the gentlemen who "could write capital books if they chose." Never do you, my public, so long as you live, listen again with complacency to the grammatical formula, "might, could, would, or should." It is nothing but a bag of wind, alike empty whether expanded or collapsed. Hoard all your gracious smiles for Messrs Do and Did, who are the only gentlemen of substantial merit that ever seek for honours at your hands.

ALEMOOR,

A TALE OF THE FIFTEENTH CENTURY.

Sad is the wail that floats o'er Alemoor's lake,
And nightly bids her gulfs unbottomed quake,
While moonbeams, sailing o'er her waters blue,
Reveal the frequent tinge of blood-red hue.
The water-birds, with shrill discordant scream,
Oft rouse the peasant from his tranquil dream;
He dreads to raise his slow unclosing eye,
And thinks he hears an infant's feeble cry.

DR LEYDEN.

In one of those frequent incursions which the Scotch Borderers used to make into the sister territory, it was the misfortune of Sir John Douglas, a gallant and distinguished warrior, to be taken prisoner by Richard De Mowbray, who, to a naturally proud and vindictive temper, added a bitter and irreconcilable hatred to that branch of the house of Douglas to which his prisoner belonged. Instead of treating the brave and noble youth with that courtesy which the law of arms and the manners of the times authorised, he loaded his limbs with fetters, and threw him into one of the deepest dungeons of his baronial castle of Holme Cultrum. Earl De Mowbray, his father, was then at the English court, in attendance on his sovereign—so that he had none to gainsay his authority, but yielded, without hesitation or restraint, to every impulse of his passions. To what lengths the savage cruelty of his temper might have led him in practising against the life of his youthful prisoner, is not known, for he was also summoned to London to assist in the stormy councils of that distracted period. Meanwhile, Douglas lay on the floor of his dungeon, loaded with fetters, and expecting every hour to be led out to die. No murmur escaped his lips. He waited patiently till the fatal message arrived, only regretting that it had not pleased heaven to suffer him to die sword in hand like his brave ancestors. "Yes," he exclaimed, as he raised his stately and warlike form from the ground, and clashing his fettered hands together, while his dark eye shot fire; "yes; let false tyrannical Mowbray come with all his ruffian band—let them give me death by sword or by cord—my cheek shall not blanch, nor my look quail before them. As a Douglas I have lived, as a Douglas I shall die." But the expected summons came not. Day after day passed on in sullen monotony, more trying to a brave mind than even the prospect of suffering. No sound broke in on the silence around him but the daily visit of a veteran man-at-arms, who brought him his scanty meal. No entreaties could induce this man to speak, so that the unfortunate prisoner could only guess at his probable fate. Sometimes despondency, in spite of his better reason, would steal over his mind. "Shall I never again see my noble, my widowed mother?—my innocent playful sister?—never again wander through the green woods of Drumlanrig, or hunt the deer on its lordly domain? Shall my sight never be again greeted by the green earth or cheerful sun? Will these hateful walls enclose me till damp and famine destroy me, and my withered limbs be left in this charnel-house a monument of the cruelty and unceasing hatred of De Mowbray?" Seven long weeks had rolled tediously along, when the prisoner was surprised by his allowance being brought by a stranger in the dress of a Cumbrian peasant. Eagerly, rapidly he questioned the man respecting Mowbray, his intentions, and why he had been so long left without being allowed to name a ransom. The peasant told him of De Mowbray's absence, and added, that, as there was to be a general invasion of Scotland, all the men-at-arms had been marched away that morning to join their companions, except the warders, by whom he had been ordered to bring food to the prisoner. Joy now thrilled through the heart and frame of the youthful warrior, but he had still enough of caution left to make no further inquiries, but allow his new jailor to depart without exciting his suspicions too early.

It is well known to those who are conversant with the history of that period, that, however bitter the animosities of the two nations were while engaged in actual warfare, yet in times of peace, or even of truce, the commons lived on friendly terms, and carried on even a sort of trade in cattle. All this was known to Sir John, who hoped, through the means of his new attendant, to open a communication with his retainers, if he could not engage him to let him free, and become a follower of the Douglas, whose name was alike dreaded in both nations. But events over which he had no control were even then working for him, and his deliverance was to come from a quarter he thought not of. At the date of this tale, the ladies of rank had few amusements when compared to those of more modern times. Books, even if they could have been procured, would sometimes not have been valued or understood, from the very limited education which, in those days, was allowed to females. Guarded in their inaccessible towers or castles, their only amusement was listening to the tales of pilgrims, or the songs of the wandering minstrels, both of whom were always made welcome to the halls of nobles, and whose persons, like those of heralds, were deemed sacred even among contending parties. To be present at a tournament was considered as an event of the first importance, and looked forward to with the highest expectation, and afterwards formed an era in their lives. When such amusements were not to be had, a walk on the ramparts, attended by their trusty maid, was the next resource against the tedium of time. It was during such a walk as this that Emma, only daughter of Earl Mowbray, addressed her attendant as follows:—"Do you think it possible, Edith, that the prisoner whom my brother is so solicitous to conceal can be that noble Douglas of whom we have heard so much, and about whom Graham, the old blind minstrel, sung such gallant verses."

"Indeed, my sweet lady," replied her attendant, "the prisoner in yonder dungeon is certainly of the house of Douglas, and, as I think, that very Sir John of whom we have heard so much."

"How knowest thou that?" inquired her lady eagerly.

"I had always my own thoughts of it," whispered Edith, cautiously, and drawing nearer her lady; "but since Ralph of Teesdale succeeded grim old Norman as his keeper, I am almost certain of it; he knows every Douglas of them, and, from his account, though the dungeon was dark, he believes it was Sir John, who performed such prodigies of valour at the taking of Alnwick."

"May heaven, then, preserve and succour him!" sighed the Lady Emma, as she clasped her hands together. Emma De Mowbray, the only daughter of the most powerful and warlike of the northern earls, was dazzlingly fair, and her very beautiful features were only relieved from the charge of insipidity on the first look, by the lustre of her dark blue eyes, which were shaded by long and beautiful eyelashes; her stature was scarcely above the middle size, but so finely proportioned that the eye of the beholder never tired gazing on it. She was only seventeen, and had not been allowed to grace a tournament, her ambitious father having determined to seclude his northern flower till he could dazzle the court of England with her charms, and secure for her such an advantageous settlement as would increase his own power and resources. Thus had Emma grown up the very child of nature and tenderness. Shut out from society of every kind, her imagination had run riot, and her most pleasing hours, when not occupied by devotional duties, were spent in musing over the romantic legends, which she heard either from minstrels, or those adventurers who oftimes found a home in the castle of a powerful chief, and which were circulated among the domestics till they reached the ear of their youthful lady. These feelings had been unconsciously fostered by her spiritual director, Father Anselm, who, of noble birth himself, had once been a soldier, and delighted, in the long winter evenings, to recount the prowess of his youth; and, in the tale of other years, often and often was the noble name of Douglas introduced and dwelt upon with enthusiastic rapture, as he narrated the chief's bravery in the Holy Land. In short, every circumstance combined to feed and excite the feverish exalted imagination of this untutored child. Had her mother lived, the sensibilities of her nature had been cherished and refined, and taught to keep within the bounds of their proper channel. As it was, they were allowed to run riot, and almost led her to overstep the limits of that retiring modesty which is so beautiful in the sex. No sooner, then, had she learnt that Douglas was the captive of her haughty brother, and perhaps doomed to a lingering or ignominious death, than she resolved to attempt his escape, be the consequences what they would. A wild tumultuary feeling took possession of her mind as she came to this resolution—what would the liberated object say to her, or how look his thanks? and oh, if he indeed proved to be the hero of her day-dreams, how blessed would she be to have had it in her power to be his guardian angel! The tear of delight trembled in her eye as she turned from the bartisan of the castle, and sought the solitude of her chamber.

It was midnight—the last stroke of the deep-toned castle bell had been answered by the echoes from the neighbouring hills, when two shrouded figures stood by the couch of the prisoner. The glare of a small lantern, carried by one of them, awoke Douglas. He sprung to his feet as lightly as if the heavy fetters he was loaded with had been of silk, and in a stern voice told them he was ready. "Be silent, and follow us," was the reply of one of the muffled visitors. He bowed in silence, and prepared to leave his dungeon; not an easy undertaking, when it is remembered he was so heavily ironed; but the care and ingenuity of his conductors obviated as much as possible even this difficulty; one came on each side, and prevented as much as possible the fetters from clashing on each other. In this manner they hurried him on through a long subterraneous passage, then crossed some courts which seemed overgrown with weeds, and then entered a chapel, where Douglas could perceive a noble tomb surrounded by burning tapers. "You must allow yourself to be blindfolded," said one of them in a sweet, musical, but suppressed voice; he did so, and no sooner was the bandage made fast, than he heard the snap as of a spring, and was immediately led forward. In a few minutes more he felt he had left the rough stones of the church, and its chill sepulchral air, for a matted floor and a warmer atmosphere; the bandage dropped from his eyes, and he found himself in a small square room, comfortably furnished with a fire blazing in the chimney; a second look convinced him he was in the private chamber of an ecclesiastic, and that he was alone.

It need not be told the sagacious reader that this escape was the work of Lady Emma, aided by Father Anselm, and Ralph Teesdale, who was his foster-brother, and thereby bound to serve her almost at the risk of his life—so very strong were such ties then considered. No sooner did Douglas learn from the venerable ecclesiastic to whom he owed his life and liberty, than he pleaded for an interview with all the warmth of gratitude which such a boon could inspire. Recruited by a night of comfortable repose, and refreshed by wholesome food, our youthful warrior looked more like those of his name than when stretched on the floor of the dungeon. It was the evening of the second day after his liberation, while Douglas was listening to his kind and venerable host's account of the daring deeds by which his ancestor, the good Lord James, had been distinguished, when the door opened, and Lady Emma and her attendant entered. Instantly sinking on one knee, Sir John poured forth his thanks in language so courtly, so refined, yet so earnest and heartfelt, that Lady Emma's heart beat tumultuously, and her eyes became suffused with tears.

"Suffer me," continued Douglas, "to behold the features of her who has indeed been a guardian angel to the descendant of that house who never forgave an injury, nor ever, while breath animated them, forgot a favour." Lady Emma slowly raised her veil, and the eyes of the youthful pair met, and dwelt on each other with mutual admiration. Again the knight knelt, and, pressing her hand to his lips, vowed that he would ever approve himself her faithful and devoted champion. The conversation then took a less agitating turn, and in another hour, Lady Emma took her leave of the good father and his youthful companion, in whose favour she could not conceal that she was already inspired with the most fervent feelings. Nor did she chide Edith, who, whilst she braided the beautiful locks of her mistress, expatiated on the fine form and manly features of Douglas, and rejoiced in his escaped.

It was now time for Sir John to make some inquiries of Father Anselm about the state of the country, and if the Scotch had beat back their assailants in the attack made upon them, and learnt, to his pleasure and surprise, that the enemy were then too much divided among themselves to think of making reprisals, the whole force of the kingdom being then gathered together to decide the claims of York and Lancaster to the crown of England; that Earl Mowbray and his son, adherents of the queen, were then lying at York with their retainers, ready to close in battle with the adverse party. It might be supposed that this intelligence would inspire the captive with the wish to complete his escape, and return to Scotland. But no. A secret influence, a sort of charm, bound him to the spot; he was fascinated; he had no power to fly, even if the massy gates of the castle had unfolded themselves before him. Bred up in the camp, Douglas was unused to the small sweet courtesies of life; his hours, when in his paternal towers of Drumlanrig, were chiefly spent in the chase, or in warlike exercises with his brothers, and the vassals of their house. His mother, a lady of noble birth, descended from the bold Seatons, encouraged such feelings, and kept up that state in her castle and retinue which befitted her high rank. His sister Bertha was a mere child, whom he used to fondle and caress in his moments of relaxation. But now a new world burst upon his astonished senses. He had seen a young, a beautiful lady, to whom he owed life and liberty, who, unsought, had generously come forward to his relief. Of the female character he knew nothing; if he did think of them, it was either invested with the matronly air of his mother, or the playful fondness of his sister. His emotions were new and delightful, and he longed to tell his fair deliverer all he felt; and—he did tell her, and—she listened. But why prolong the tale? Interview succeeded interview, till even Father Anselm became aware of their growing attachment. Alas! the good priest saw his error too late; and although, even then, he attempted to reason with both on the consequences of their passion, yet his arguments made no impression. "You will turn war into peace," whispered Emma, as she listened to her spiritual director, "by healing the feud between the families." "And you will, by uniting us," boldly exclaimed the youthful lover, "give to the Mowbrays a friend who will never fail in council or in field." Overcome by this and similar arguments, the tender-hearted Anselm at last consented to join their hands. At the solemn hour of midnight, when the menials and retainers were bound in sleep, an agitated yet happy group stood by the altar of the castle chapel. There might be seen the noble form of Douglas, with a rich mantle wrapped round him, and the fair and beautiful figure of his bride, as she blushingly left the arm of her attendant to bestow her hand where her heart was already given. The light of the sacred tapers fell full upon the reverend form of Father Anselm, and the chapel reverberated the solemn words he uttered, as he bade heaven bless their union. The athletic figure of Ralph Teesdale was seen near the door, to guard against surprise.

Nothing occurred for some time to mar the harmony and peace of the married lovers. At length their tranquillity was broken by the accounts of the fatal and bloody battle of Towton, which gave a death-blow to the interests of the Lancastrians. This news spread consternation among the small party at Holme Cultrum. The question was, whether to remain, and boldly confront the Mowbrays, or fly towards Scotland, and endeavour to reach Drumlanrig; but the distracted state of the country forbade this plan; and the arrival of some fugitives from the field of battle having brought the intelligence that both Earl Mowbray and his son were unwounded, and had fled to France, determined the party to remain where they were. This, however, they soon repented of, when they understood that a large body of Yorkists were in full march northward to demolish all the castles held by the insurgent noblemen. This trumpet-note roused the warlike spirit of Douglas. He boldly showed himself to the soldiers, and swore to defend the castle to the last, or be buried in its ruins, if they would stand by him. But the men-at-arms, either unwilling to fight under a stranger, or panic-struck at their late defeat, coldly met this proposal; and while Father Anselm and Douglas were examining the outward works, they made their escape by a postern, leaving only two or three infirm old men, besides the menials, to resist the conquering army. Sir John, undaunted by the dastardly behaviour of the men, still continued his preparations, and inspired such courage into the hearts of his little garrison, that they vowed to stand by him to the last. But these preparations were made in vain: Edward, either allured by the prospect of greater booty in some richer castle, or afraid of harassing his troops, turned aside into the middle counties, and left the bold-hearted Douglas to the enjoyment of his wife's society. Months of unalloyed felicity were theirs; and while England was torn by civil dissensions—when the father pursued the son, and the son the father, and the most sacred bonds of nature were rent asunder at the shrine of party, and while the unburied dead gave the fields of merry England the appearance of a charnel-house—all was peace, joy, and love within the walls of Holme Cultrum. Seated in the lofty halls of her fathers, Lady Emma appeared the personification of content; hers was indeed that felicity she had not dared to hope for even in her wildest day-dreams. It was indeed a lovely sight to behold her leaning on the arm of her noble husband, listening to his details of well-fought fields; her eye now sparkling with hope, and her cheek now blanched with terror, as they paced in the twilight the ample battlements of the castle; it was like the ivy clinging and clasping round the stately oak. If at such moments Douglas wearied of the monotony of existence, and half wished he was once more in the front of battle, he had only to look in the soft blue eye of his Emma, press her to his heart, and every thing else was forgot.

Summer had passed away, and the fields wore the golden livery of autumn. It was in a beautiful evening, when Douglas, Lady Emma, and Father Anselm, were enjoying the evening breeze, when Ralph Teesdale rushed before them, his face pale, and his trembling accents proclaiming his terror. "Fly, my lord," he cried, addressing Douglas: "Fly," he continued, "for you are betrayed; the earl is come, at the head of a band of mercenaries, and vows to have your head stuck upon the battlements before to-morrow's sun rise." "I will not fly," said Douglas; "boldly will I confront the earl, and claim my wife." "My father is good, is kind; he will yield to the prayers and tears of his Emma." "Alas, alas, my dearest and honoured lady," rejoined her foster-brother, "your noble father is no more, and 'tis your brother who now seeks the life of Douglas." The first part of the sentence was only heard by Lady Emma, who fell senseless into the arms of her husband, and was immediately conveyed to her chamber by her ever ready attendant. A hasty council was then held between Father Anselm and Douglas. "You had better take the advice of that faithful fellow, and give way. You know," continued the friar, "the dreadful temper and baleful passions of Richard De Mowbray. Not only your own life, but that of your wife, may fall a sacrifice to his fury, were he to find you. I am well aware that he has long considered his sister as an incumbrance on his succession, and will either cause her to be shut up in a monastery, or secretly destroyed." Douglas shuddered at the picture, and asked the holy father what he should do. "Retreat to my secret chamber in the first instance; it were madness, and worse, to attempt to exclude Baron De Mowbray from his castle, even if we had sufficient strength within, which you know we have not. I shall cause Lady Emma to be conveyed there also when she recovers; we must resolve on some scheme instantly; the secret of the spring is unknown to all but your faithful friends."

Douglas allowed himself to be persuaded, and was soon joined in his retreat by Lady Emma and Edith. Flight, instant flight, was resolved on; and the timid and gentle Emma, who had hardly ever ventured beyond the walls of the castle, declared she was ready to dare every thing rather than be torn from her husband, or be the means of his being consigned to endless captivity, or, it might be, a cruel and lingering death. Father Anselm set off again in search of Ralph, and soon returned with the joyful intelligence that De Mowbray was still at a castle a few miles distant; that those of his followers who had already arrived were then carousing deeply; and as soon as the first watch was set, a pair of fleet horses would be waiting at the small postern, to which Douglas and his lady could steal unobserved, wrapt in horsemen's cloaks. The short interval which intervened was spent in making such preparations as were required for the travellers, by Edith and by the churchman, in fervent petitions to heaven for their safety. At length the expected signal was given from the chapel, and the agitated party stood at the low postern, where Ralph waited with the horses. It was some moments before the lady could disengage herself from the arms of her weeping attendant; but the Father hurried them away, and soon their figures were lost in the gloom, and their horses' tread became faint in the distance.

Well it was for the fugitives that their plans had been so quickly executed, for ere midnight the trumpets of De Mowbray sounded before the castle gate. There all was uproar and confusion. The means of refreshment had been given with unsparing hand, and the wild spirits of the mercenaries whom he commanded were then in a state bordering on stupefaction from their lengthened debauch. The few who accompanied him were not much better, and he himself had all his evil passions inflamed by the wine he had quaffed with the Lord of Barnard Castle. Hastily throwing himself from his reeking charger, he entered his castle sword in hand, and ordered his sister to be brought before him, and the castle to be searched, from turret to foundation-stone, for the presumptuous Douglas. Pale, trembling, and in tears, Edith threw herself at his feet. "O my good lord, my lady, my dear lady, is ill, very ill, ever since she heard of the death of her honoured father. To-morrow she will endeavour to see you."

"Off, woman!" he exclaimed. "This night I must and shall see my sister, dead or alive;" and he arose with fury in his looks. But Wolfstone, his lieutenant, a brave young man, stepped before him, and, drawing his sword, exclaimed, "You must pass over my dead body ere you break in upon the sacred sorrows of Lady Emma." There was something in the brave bearing of the gallant foreigner which even De Mowbray respected, for he lowered his voice, and, stealing his hand from his dagger, said, "And where is Father Anselm, that he comes not to welcome me to the halls of my fathers?" "He is gone," returned Edith, "to the neighbouring monastery, to say a mass for the honoured dead," and she devoutly crossed herself, turning her tearful eye on Wolfstone, who, with the most respectful tone, added, "Go, faithful maiden, say to your lady that Conrade Wolfstone guards her chamber till her pleasure is known." "Now lead in our prisoner there;" but a dozen of voices exclaimed against further duty that night. "He sleeps sound in his dungeon floor," said De Mowbray's squire, "and to-morrow you may make him sleep sounder if you will. A cup of wine would be more to the purpose, methinks, after our long and toilsome march." A hundred voices joined in the request. The wine was brought, and the tyrant soon forgot his projects of vengeance in the pleasures of a prolonged debauch. He slept, too, that unnatural monster slept, and dreamt of his victims, and the sweet revenge that was awaiting him. It was owing to the presence of mind of Ralph that the flight of Douglas was not discovered. He had the address to persuade the half-inebriated soldiers that the prisoner was actually securely fettered in the dungeon which he had all along occupied. No sooner did he see them all engaged in the new carousal than he fled, and joined Edith in the secret chamber, where they joined Father Anselm in his devotions, and prayed for blessings on the head of their noble lord and lady.

Meanwhile the fugitives had reached Scotland, and were now leisurely pursuing their way, thinking themselves far beyond the reach of pursuit. On their first crossing the Border, a shepherd's hut afforded the agitated Lady Emma an hour's repose and a draught of milk; the morning air revived her spirits, and once more she smiled sweetly as her husband bade her welcome to his native soil. From the fear of pursuit, they durst not take the most direct road to Drumlanrig, but continued to follow the narrow tracks among the hills, known only to huntsmen and shepherds.

It was now evening: the sun was sinking among a lofty range of mountains, tinging their heathy summits with a purple hue, as his broad disc seemed to touch their tops. The travellers were entering a narrow defile, at the end of which a small but beautiful mountain lake or loch burst upon their sight; its waters lay beautifully still and placid, reflecting aslant a few alder bushes which grew on its banks, while the cana, or wild cotton grass, reared its white head here and there among the bushes of wild thyme which sent their perfume far on the air. The wild and melancholy note of the curlew, as she was roused from her nest by the travellers, or the occasional bleat of a lamb, was all that broke the universal stillness.

"Ah, my love," said Lady Emma, riding up close to her husband, "what a scene of peace and tranquillity! Why could we not live here, far from courts and camps, from battle and bloodshed? But," she continued looking fondly and fixedly at her husband, "this displeases you—think of it only as a fond dream, and pardon me."

"True, my Emma," returned Douglas, "these are but fond dreams; the state of our poor country commands every man to do his duty, and how could the followers of the bloody heart sheathe their swords, and live like bondsmen? Never, never! But ride on now; the smoke from yonder cabin on the brow of the hill promises shelter for the night, and, ere to-morrow's sun goes down, you shall be welcomed as the daughter of one of the noblest dames of Scotland.

Ride on—the night wears apace." Scarcely had the words passed his lips, when the quick tramp of a steed behind him caused him to turn round. It was Mowbray, his eyes glaring with fury, and his frame trembling with rage and excitement.

"Turn, traitor, coward!—Robber! turn, and meet your just punishment."

"Coward was never heard by a Douglas unrevenged," was the haughty answer to this defiance, as he wheeled round to meet the challenger, at the same time waving to Lady Emma to ride on; but she became paralyzed with fear and surprise, and sat on her palfrey motionless. Both drew their swords, and the combat began. It was furious, but short: Douglas unhorsed his antagonist, and then, leaping from his own steed, went to assist in raising him, unwilling farther to harm the brother of his wife. But oh, the treachery and cruelty of the wicked! No sooner did the tender-hearted Douglas kneel down beside him to ascertain the nature of his wounds, than Mowbray drew his secret dagger, and stabbed him to the heart.

* * * * * *

The moon rose pale and cold on the waters of this small inland lake, and showed distinctly the body of a female lying near its shore, while a dark heap, resembling men asleep, were seen at a little distance, on a rising ground—the mournful howl of a large dog only broke the death-like stillness; soon, however, a horseman was seen descending the pass; he was directed by the dog to the female, who still lay as if life indeed had fled; he sprung from his horse, and brought water from the lake, which he sprinkled on her face and hands. Long his efforts were unavailing, but at last the pulse of life began once more to beat, the eye opened, and she wildly exclaimed, "O do not kill him." "He is safe for me, lady," said the well-known voice of Ralph Teedsdale. "Thou here, my trusty friend!" murmured Lady Emma; "bear me to Douglas, and all yet may be well." She could utter no more; insensibility again seized her, and Ralph, lifting her up, bore her in his arms to what he supposed to be a shepherd's cottage, but found it only a deserted summer shealing. He was almost distracted, and, laying down his precious burden, wrapped in his horseman's cloak, he ran out again in search of assistance, though hardly hoping to find it in such a wild district, still closely followed by the dog, which continued at intervals the same dismal howl which had attracted the notice of Ralph as they ascended the hill; the sad note of the hound was answered by a loud barking, and never fell sounds more welcome on the ear of the faithful vassal; he followed the sounds, and they led him to a hut tenanted by a shepherd and his wife. His tale was soon told. They hastened with him to the deserted shealing, where they found the object of their solicitude in a situation to demand instant, and female assistance. There, amid the wilds of Scotland, in a comfortless cabin, the heir of the warlike and noble Sir John Douglas first saw the light. Long ere perfect consciousness returned, Lady Emma was removed to the more comfortable home of the shepherd, and there his wife paid her every possible attention. The care of Ralph consigned the remains of the rival chiefs to one grave. It was supposed that De Mowbray had expired soon after giving Douglas the fatal stroke, as his fingers still firmly grasped the hilt of his dagger. Their horses and accoutrements were disposed of by the shepherd, and thus furnished a fund for the maintenance of the noble lady, who was so strangely cast upon their care. Many weeks elapsed ere she was aware she had neither husband nor brother.

* * * * * *

Time, which calms or extinguishes every passion of the human heart, had exerted its healing influence over the mind of Lady Emma. She sat watching the gambols of her son on the banks of the peaceful lake, whose waters had first recalled her to life on the disastrous evening of his birth. There was even a smile on her pale thin lip, as he tottered to her knee, and laid there a handful of yellow wild-flowers. She clasped the blooming boy to her heart, murmuring, "My Douglas!" On her first awakening to a full sense of her loss and forlorn condition, it was only by presenting her son to her that she could be persuaded to live; and when her strength returned, she determined to go to Drumlanrig, and claim protection for herself and child; but the prudence of Ralph suggested the propriety of his first going to ascertain the state of the family, and, recommending his lady to the care of Gilbert Scott and his kind-hearted wife, he set out on his embassy. But sad was his welcome. The noble pile was a heap of blackened and smoking ruins, and the lady fled no one knew whither. Sad and sorrowful he returned to the mountain retreat, and was surprised at the calmness with which his honoured mistress heard his tale. Alas, he knew not that the pang she had already suffered made every loss appear trivial! The lonely shealing was repaired and furnished. Here Lady Emma, in placid content, reared her child, attended by her faithful Rosetta and Ralph, who made occasional excursions to the neighbouring town to supply her with any necessary she might require. On an occasion of this kind, when the little boy was nearly two years old, she sat in the door of her humble dwelling, listening to his sweet prattle. It was the first time he had attempted to say the most endearing of all words. She forgot her sorrows, and was almost happy. Her attention was soon called to some domestic concern within the cottage. The boy was on his accustomed seat at the door, when a shrill and piercing scream caused her to run out. Need her anguish and despair be painted, when she saw her lovely boy borne aloft in the air in the talons of a large eagle! To run, to scream, to shout, was the first movement of the phrenzied mother; but vain had been her efforts, had she not been almost immediately joined by some of her neighbours, whose united efforts made the fatigued bird quit his prey, and drop it into the loch. Many a willing heart, many an active hand, was ready to save the boy. He was delivered to his mother, but, alas, only as a drenched and nerveless corse. Human nature could endure no more. Her brain reeled, and reason fled for ever. Her faithful and attached follower returned to find her lady a wandering maniac. Year after year did he follow her footsteps, nor, till death put a period to his sufferings, did his care slacken for one instant. After he had seen her laid by her husband and brother, he bade adieu to the simple inhabitants, and it is supposed he fell in some of the border raids of the period, as he was never more heard of.

Reader, this tale is no idle fiction. On the borders of Alemoor loch in Selkirkshire may still be seen a small clump of moss-grown trees, among which were one or two of the crab-apple kind, which showed that here the hand of cultivation had once been. Within this inclosure was a small green mound, to which tradition, in reference to the above story, gave the name of the Lady's Seat; and about half a mile to the south-west of the lonely loch, is an oblong bench, with a rising ground above, still called the Chieftain's Grave.

NATURAL HISTORY.

THE POLECAT.

The length of the polecat, from the point of the nose to the insertion of the tail, is from seventeen to eighteen inches; the tail is short and bushy, measuring about three inches; the ears are short, round, and tipped with white. The ordinary colour is of a deep chocolate, sometimes nearly black; the sides are covered with hair of two colours, being darker at the tips, like the rest of the body, and the middle of a tawny hue.

The polecat is an active and nimble animal, and runs very fast by a succession of leaps, which is the only way it can make rapid progression, owing to the shortness of its legs. It can creep up the side of a wall with much agility. It inhabits woods or thick brakes, where it burrows under ground, forming a shallow retreat from two to three yards in length, generally terminating in a round chamber among the roots of trees. It seldom leaves its burrow during the day, being a nocturnal animal. It is very destructive to poultry, pigeons, young rabbits, and game of all kinds. Its thirst for blood is so excessive, that it usually kills many more than it can eat. A few pairs of them are sufficient to desolate a whole rabbit warren.

During winter, the polecat frequents houses, barns, and other places connected with farm establishments, feeding on poultry, eggs, and milk.

This species is numerous in Britain, and most other parts of Europe. Lorraine, a province of France, is completely overrun with polecats, owing to some strange superstition of the inhabitants, who will not destroy them; so that there, and in the adjoining cantons, they have become a literal pest, and it is next to impossible to preserve poultry from their ravages. It is a superstitious but erroneous belief with these ignorant peasants that polecats will never destroy poultry in places where they reside, but extend their depredations to distant parts. This argument, however, although true, would but free them from those they foster, while they would suffer from the forays of those more remote.

The female polecat produces from three to six young ones in the beginning of summer. This usually takes place in the immediate neighbourhood of some farm; and they early accustom their progeny to the use of animal food.

The skin of the polecat, when properly manufactured, is a valuable fur, and especially when taken in the winter. It is, however, a difficult process to free the skins from their fetid and offensive odour.

Several of the old writers mention that the polecat will prey upon fish. The following confirmation of this fact is recorded in "Bewick's Quadrupeds:"—During a severe storm, one of these animals was traced in the snow, from the side of a rivulet to its hole at some distance from it: as it was observed to have made frequent trips, and as other marks were to be seen in the snow which could not easily be accounted for, it was thought a matter worthy of greater attention. Its hole was, accordingly, examined, the polecat taken, and eleven fine eels were discovered to be the fruit of its nocturnal excursions. The marks in the snow were found to have been made by the motion of the eels in the creature's mouth.

THE WEASEL.

The body of the weasel is seven inches in length, and the tail only two inches and a half, ending in a sharp point. The height of the animal is little more than two inches and a half, consequently its length is nearly four times that of its height. Its usual colour is pale reddish brown on the back, sides, and legs; the throat and belly are white; on each side of the head, under the corners of the mouth, there is a brown spot: its ears are short and round, and its eyes small, black, and sparkling: its whiskers are very long; and its teeth are exceedingly sharp, so that it bites with great keenness.

Although the weasel is but a slender animal, yet it is more than a match for the largest rat, to which he is a mortal enemy, and frequently proves extremely useful in ridding stack-yards and barns of this destructive vermin, as well as mice; on which account, its company is often courted by the farmer: it is even more useful than the cat in destroying rats, for, from the slender form of its body, it can pursue them into their holes, where they are soon killed. It is a destructive enemy to pigeons, as it creeps into the holes of a dovecot in the evening, and surprises its prey while they are asleep. In short, from the peculiar construction of its body, there are few situations it is incapable of reaching, as the sharpness of its claws enables it to clamber up an almost perpendicular wall.

The weasel is a lively and active animal, common in all parts of Britain; and being of a fierce and bold disposition, proves very destructive to farm-yards and warrens. It devours eggs with much voracity: in this operation it makes a small hole in the end of the egg, and sucks the contents out, leaving the shell entire. Rats, on the contrary, usually drag the eggs from the nest, and either break them to pieces, or make a large hole in them: from these distinctions, the farmer may readily guess which was the depredator.

It is said that the weasel prefers meat which has become partially putrid. Buffon, in illustration of its attachment to putrid substances, says, that a weasel, with three young ones, was taken out of the carcase of a wolf that had been hung on a tree by the hind feet. The wolf was almost entirely putrified, and the weasel had made a nest of leaves and herbage for her young in the thorax of the corrupt carcase.

The female brings forth in spring, and usually produces four or five at a litter. The young ones are blind at birth, but soon receive their sight, and are not long of being able to follow the dam in her predatory excursions.

The weasel is of a wild and untractable nature, being exceedingly difficult to tame. When kept in a cage, it seems in a perpetual state of agitation, is terrified at the sight of all who approach to look at it, and generally endeavours to hide itself beneath the straw, or other substances which may be at the bottom of its cage. There are, however, instances on record of weasels being completely domesticated.

Although Buffon was of opinion that the weasel was an animal incapable of domestication, Mademoiselle de Laistre proves that in some instances it may be tamed. In a letter, she gives the following amusing account of it:—"If I pour some milk into my hand," says she, "it will drink a good deal; but if I do not pay it this compliment, it will scarcely take a drop. When it is satisfied, it generally goes to sleep. My chamber is the place of its residence; and I have found a method of dispelling its strong odour by perfumes. During day, it sleeps inside a quilt, which it enters by a place which is unsewed in its edge, which it accidentally discovered; at night, I keep it in a wired cage, which it always enters with much reluctance, but leaves with joy. If the servant sets it at liberty before I am up in the morning, after a thousand gambols it enters my bed, and reposes in my hand, or on my bosom. If I am up before it is let out, it will fly to me in rapture, and spend half an hour in caressing me, playing with my fingers, and nibbling at them with its teeth, like a little dog: leaping on my head, and on my neck, and then running round my arm with the softness and elegance of a squirrel. Such is its agility that it will leap into my hands, although upwards of a yard distant, if I present them to it. It exhibits much adroitness and cunning to obtain any wished-for object; and it is so capricious at times as to perform certain acts apparently from contradiction. It seems at all times exceedingly desirous of being noticed, watching my eye during all its little pranks, to see if I observe it. If I am inattentive to its sports, it seems to have no pleasure in them, and immediately desists, and lays itself down to repose. It is so lively, that the moment I awake it, however sound its sleep may be, it instantly resumes its gambols, with as much spirit as before it slept. It never is out of temper, unless when much teased, or when under confinement, which it mortally detests; in which case, it displays its displeasure by a kind of low murmur, quite opposed to its voice when pleased. This little creature can distinguish my voice amid twenty others, and springs over every one in the room till it has found me. Nothing can exceed the lively and pleasing way it caresses me; with its two little paws it frequently pats me on the chin, in a manner that expresses the utmost fondness. This, with a thousand other kindnesses, convinces me of the sincerity of its attachment. He is quite aware of my intentions when dressed to go out, and then it is with much difficulty I can rid myself of him; on these occasions, he will then conceal himself behind a cabinet near the door, and springs on me as I pass with astonishing quickness.

"This vivacity, agility, and voice, with the manner he utters it, have a strong similitude to those faculties in a squirrel. In the summer season, he runs about all night squeaking, but since the cold set in, he has desisted from this practice, but has sometimes expressed this peculiar sound when rolling on my bed in the sunbeams.

"It seems extremely probable that the weasel sips

the dew, judging from the remarkable manner he drinks milk from my hands. He will never drink water when he can get milk, and then it is in such a small way, that he appears only to do it to cool his tongue; for he evinced fear on several occasions when water was presented to him. During the summer showers, I caught some rain water, and endeavoured to get him to enter it to bathe himself; but this he would not do. I then dipped a piece of linen cloth in it, which seemed to afford him much pleasure by rolling himself on it, which he did frequently.

"The curiosity of this little pet is unbounded, for it is impossible to open a drawer, or box, without his roving through every part of them; if even a piece of paper, or a book, is looked at, he will also examine it with attention. Every thing I take into my hand he must run up to and survey, with an attentive scrutiny. I have a young dog and cat, with both of which he is very familiar; he will scamper over their necks, backs, and legs, without them offering him the smallest injury."

The following circumstance strongly illustrated the determined spirit of this little animal:—

An eagle having seized a weasel, mounted into the air with its prey, and was soon after observed to exhibit symptoms of distress. Its little enemy had extricated itself so far as to be able to bite the eagle in the throat, and kept its hold with such pertinacity, that he soon brought the eagle to the ground, and the weasel, finding himself fairly on terra firma again, took care to make good his retreat.

One fine summer evening, about thirty years ago, as Mr Brown was returning from Gilmerton, near Edinburgh, by the Dalkeith road, he observed on the high ground at a considerable distance, betwixt and Craigmillar Castle, a man, who was leaping about, performing a number of antic gestures, more like those of a maniac than of a sane person. After contemplating this apparently absurd conduct, Mr Brown began to think it might be some unfortunate maniac, and, climbing over the wall, made directly towards him; and when he got pretty near, he perceived that this man had been attacked, and was defending himself against the assault of a number of small animals, which he at first took for rats, but which, in fact, turned out, on getting closer, to be a colony of from fifteen to twenty weasels, which the unfortunate man was tearing from him, and endeavouring to keep from his throat. Mr Brown joined in the combat, and, having a stick, contrived to hit several of them, and laid them lifeless. Seeing their numbers decreasing, the animals became intimidated, and speedily fled towards a rock hard by, and disappeared in its fissures. The gentleman was nearly overcome with fatigue and exhaustion, having been engaged in his struggle with the weasels, as far as he could guess, upwards of twenty minutes; and but for the fortunate and timely assistance of Mr Brown, he said he must have inevitably fallen a victim to their fury, as he found himself quickly losing strength from the violence of his exertion. His chief attention was turned to keeping them from his throat, to which they seemed instinctively to direct their course. He was a powerful man, otherwise he must have sunk under their ferocity. He had squeezed two to death while tearing them from him. His hands were much bitten, and were streaming with blood from the wounds.

The account he gave of the commencement of the affray, was, that he was walking slowly through the park, when he happened to see a weasel; he ran at it, and made several unsuccessful attempts to strike it with a small ratan he had in his hand. On its getting near the rock above mentioned, he got betwixt it and the animal, and thus cut off his means of retreat; the weasel squeaked aloud, when an instantaneous sortie was made by the whole colony, and the attack commenced.

LETTER FROM CANADA.

[The following well-written letter has been put into our hands by a gentleman of this city, and as it cannot fail to be of service to many of our readers, we readily afford it a place. It is the composition of a person who very lately emigrated to Canada.]

G—— Brule, Township of M'Nab,
Upper Canada, Jan. 13, 1833.

My Dear Mother—You'll no doubt have passed many an anxious hour about us since we left you, and I am sure it will afford you the greatest pleasure and consolation to hear that we are all in the very best health, and in all likelihood, in a short time, to have in this country every comfort we could desire.

I might have written to you sooner, but could not have done it so satisfactorily, for it is little more than a month since we were finally on our own land, and in our own house. We had about eight weeks' passage from Leith to Quebec; but, upon the whole, as comfortable a one as we could expect in so crowded a vessel. We left Quebec, the same day we arrived, by the steamer for Montreal, where we remained five days, waiting the sailing of the track-boats through the Lachine Canal. Mr S——, to whom, you know, I had a letter of introduction, received me very kindly, and offered me the grant of 100 acres of land, in the lower province, free, if I chose to remain; or, if I preferred going to Niagara, he would recommend me to the situation of a book-keeper to a gentleman from that place, who was then at Montreal. We had steam navigation to Bytown, a distance of 120 miles from Montreal, and then, partly by land, but mostly by canoes, a farther distance of 50 miles, to this township, where we arrived in the middle of August.

I met with a warm and hospitable reception from M'Nab. We remained with him until I fixed upon a lot of land, where there was a small clearance, and a house; but we had not been on this lot more than a month, when the former occupier made his appearance, and claimed the lot as his. He had verbally given it up, but as he held the location ticket, we were obliged to leave it, and accepted the invitation of our then next neighbour to remain with him until we fixed upon another lot. This person was then in the midst of his harvest, and we gave him what assistance we could, and were thus gaining a little knowledge of the customs of the country, and, at same time, becoming better acquainted with the nature of the land. I was cautious in fixing upon another lot, and went through the greater part of the township before I did so. I at last selected the one upon which I am now sitting. This lot is what is here called a Brule, a French term, but completely adopted here, meaning a place that has been burnt. A Brule is the wildest place of the forest. I have retained the name, and, in compliment to my mother, have prefixed her maiden name. It is customary for the settlers to give their lot a name, and it behoved me to do the same. It frequently happens that fires arise in the woods in this country; and seven years ago, six miles long, by three broad, of this township, was under fire, which has consumed a good deal of the timber; but the most of it is only killed, and, in the course of a few years, a great part of the hardwood is thrown down, and the under brush springing up. My Brule formed part of this burning, and last autumn, I mean the autumn of 1831, it was again under fire, so that now there is scarce a living tree upon the lot, and a deal of the timber consumed, and in many places of the rear there is scarcely a stump left; and I may have 20 or 30 acres under crop next spring, if I can procure a yoke of oxen and seed. The soil is a red clayey loam, lying mostly upon limestone, but partly upon a yellowish clay. The rear of the lot is a succession of gentle swelling banks, running across the lot till they terminate near the river Dochart, about 100 or 150 acres lower, where the land becomes a strong bluish marly clay. The land falls in the same manner again towards the Grand River; and as the neighbouring lots suffered also in the burnings, and my house being placed in the rear of the lot, I can see from it nearly a mile round me in all directions. I have hitherto spoken only of the lot I hold free; but upon settling on land here, two things are particularly to be considered, that is, firewood and water. I have plenty of excellent water on this lot. About the centre of it there is a fine running creek, that neither freezes in winter nor gets dry in summer; but I had no growing firewood, and the common estimate is, that a settler should retain for that purpose from 20 to 30 acres of growing wood. In these circumstances, it became necessary to obtain this; and as the chief* held the lot in the rear of the one I have been speaking of in his own hands, he agreed to let me have it on the same terms as his other settlers—that is, after three years, to pay him a barrel and a half of flour per 100 acres; and as there is about 140 acres of it, you will see that I thus hold about 340 acres of land. There are from 30 to 40 acres of this lot adjoining the other one, also burnt in the same manner; but there is a point of it which the fire did not reach, that is within 500 yards of my house, which in a year or two I will have to resort to for firewood. The soil of this lot is somewhat like the other, and the finest part of it runs down to and overhangs the lake, commanding a fine view of the lake and of the opposite shores of Lower Canada. The lake opposite me is from one to two miles broad. The fire of 1831 left the greater part of my free lot quite bare; but in the course of last summer there sprung up a weed called Indian kale, the same plant that is cultivated with you as a garden flower, with which it is completely covered, and interspersed with young trees, which have already attained the height of two to three feet. Accidents have never happened to any of the settlers from these fires, as they never encroach upon the clearances. Where fire has run, or where a clearance has been made, and then left in a state of nature for four or five years, as was the case with six or eight acres of the lot I settled on first, there sprung up in the greatest profusion currants, gooseberries, raspberries, strawberries, plums, and white clover, which it appears are all indigenous to this country. I would have preferred placing my house upon the lot adjoining the lake, and close to the lake, where there is a fine flat of the finest soil covered entirely with hardwood, consisting of maple, beech, barwood, and oak, of about 50 acres in extent; but, in the meantime, I thought it more advisable to place it as nearly as possible in the midst of the greatest extent of my best and clearest land. In a few years this will become a valuable situation, as the summer after next it is expected a steam-boat will ply daily from Bytown to about 20 miles above this township. We saw this vessel building when on our way up, and she was finished in time to make a few trips last year to the Chats Rapid, 10 miles below us. These rapids have been surveyed, and a canal of three or four miles will be cut next spring, to avoid them; so that, in the course of another year or two, we will have a continued chain of steamboats from Montreal to about 20 miles above us.

This township is as yet in its infancy, although it has been settled for about ten years. The settlers are only between fifty and sixty, and being mostly from the Highlands, and without capital or experience as farmers, they have made but little progress. Settlers in a new township have many and great difficulties to contend with at first, but the worst of these are now over here, and we may expect to make henceforth rapid improvement. Within the last two or three years, more enterprising men have settled on the township. Two or three of the old settlers, who have lots on the lake, have gained money by keeping taverns, where there is a very considerable trade from the number of lumbering parties on the Grand River and the Madawasea; and among the recent settlers are two Stirlingshire men, who keep a store, and are erecting extensive saw-mills at the mouth of the latter. These mills are nearly ready to commence operations, and, when ready, they commence the erection of a flour mill, a great want here at present, the settlers having to go to the neighbouring township to get their flour made. The most of the settlers who have been here a few years are in comfortable circumstances; for the last season or two, they have been able to procure the use of a yoke of oxen, by rearing them or otherwise, and have now from ten to thirty acres under crop. In addition to the yoke of oxen, they have in general from two to six milch cows, one or two couple of young steers, two or three young cows, half a score to a score of sheep, and a few of them have a horse or two, with pigs, and plenty of the finest poultry. During six months of the year, these animals cost them nothing, but are turned into the woods, where they feed luxuriantly, each settler's cattle generally keeping by themselves, and commonly take a circuit of three or four miles round the clearance. The only inconvenience of this is the trouble of searching for the cows to be milked twice a-day, or for the oxen, when they are wanted for work. The most docile cow has a bell put round her neck, and by the sound of this, or by their track, they are traced, for they have generally to be searched for, seldom coming home of themselves; and every man's cattle are allowed to graze where they please, except where the land is fenced, and a settler fences only his cleared land. The crops cultivated here are principally wheat, Indian corn and potatoes, with a little beer, rye, oats, pease, and turnip, as well as pumpkins, which are generally grown among the Indian corn. Timothy hay is also cultivated, and brings from L.2 to L.4 per ton. Wheat fetches about 5s., Indian corn 4s., oats 2s. 6d., potatoes 1s. 6d. per bushel; and those settlers who have any of these articles for sale find a ready market for them at these prices, principally to the lumberers, taken from their own doors. Many of the settlers take only half a lot, that is, 100 acres, and are entitled by their location ticket, as soon as they have done the settlement duties, namely, cleared 5 acres per 100, to claim a patent deed at their own expense, which costs about L.2, and this entitles them to vote for a member of Parliament. There is a general meeting of the township held annually, on the first Monday of January, when all matters relative to the internal government of the township are agreed upon, and where we elect assessors, tax-collector, town-wardens, path-masters, town-clerk, &c., and at which M'Nab votes only as an individual, and has no control over the settlers, except as a justice of the peace.

(The remainder of this letter in the ensuing Number.)

* It is presumed that the chief of M'Nab is here meant.—*Ed.*

THE NORWEGIANS.

Extreme poverty in some parts of Norway causes a paucity of articles that may be almost regarded as necessary to the comforts of life. In some houses the whole stock of utensils are—one large iron pot, an axe, one knife, and half a dozen wooden bowls and spoons. The severity of the climate obliges the people to sleep in their only room that has a fire-place, and in one large bed, like a deal box, into which they all creep; some straw is spread at the bottom, and sheep-skins serve for covering. They seem to have scarcely a fixed hour for sleep, but each gets in by day, as he finds himself tired. The swampy lands they labour in prevents the women's bare feet, or their miserable remnants of shoes and stockings, from ever being clean; but their tables, and what utensils they have, are generally spotless. Destitute as they are of every worldly comfort, two or three religious books are to be found in every house. The hope of the weary and heavy laden in every clime is not denied to these poor sojourners in the valley of tears.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

No. 73. SATURDAY, JUNE 22, 1833. PRICE THREE HALFPENCE.

FAMILY AFFECTIONS.

In the chequered and often weary pilgrimage of life, there is nothing, after religion, which yields so uniform and unfailing a measure of comfort as the affections springing from ties of blood. To all men we are in some measure brothers: there are general sympathies which bind the whole race together as one family, and others which, uniting larger or smaller parties, and inspiring them with common objects, form solid brotherhoods and corporations, for general and individual advantage. In all these unions, however, the binding sympathies are of a vague nature, compared to those which knit together the little circle of a domestic hearth. It is there alone that the reasons for union exceed in number and strength the reasons for disunion, and there alone that we may hope to find an attachment, which will be alike ready to resist and to consult a sense of interest. In the world at large, the sympathies of those around us are only to be roused by a particular exigency, and we might live for ever without acquiring a single friend. In our homes, on the contrary, every man feels as if he were hedged round by a faithful and devoted body-guard, whose eyes are as beacons to guide and welcome him to their hearts, and whose best offices can only be withheld when they are either repressed by coldness or eminently undeserved. In all spheres of life this is the same, and the poor man, though doomed, perhaps, to suffer under the contumely of the proud, finds as much esteem and affection in his own humble circle, and is thereby as much comforted and supported, as if he possessed all the boasted advantages of fortune.

Since such are the blessings which Almighty Providence has conferred upon us through the medium of family ties, of what importance must it be that we cultivate these ties with all tenderness and care, and scrupulously avoid every occasion of doing them injury! Of how much importance is it, in the first place, that we give that honour to our parents, which, leaving out of view the sacred command of our Divine Father, is so strongly required of us, not only by gratitude for early nurture, and for the trouble, anxiety, and cost which they have freely suffered and expended in our behalf, but in order that we might continue to enjoy the full measure of that parental affection, which, in all young people of right minds and feelings, has heretofore been the greatest blessing of life! Of what importance is it, with a view to ourselves becoming the honoured head of a family circle, that we do not at the very first step—namely, in marriage—barter away the affections, and all their golden associations, for some unworthy object, the end of which will be loneliness and sickness of heart, and an endless train of miseries, perhaps, which even wealth, though it may gild, can never alleviate! Or what importance is it, that, in all our intercourse with brothers, with sisters, and even with more distant relations—for, thanks to the Fountain of all Good, there is much earnest affection beyond the immediate family circle—we should avoid all those nameless and almost imperceptible causes of wrath, which so often arise, like the viewless pestilence, to dissever the hearts which nature has intended to be the fondest, and leave, each to the loneliness of his own desolate and angry feelings, those who know that they ought to be as one, and, even in their disunion, wish to be so!

The general sense of mankind is well aware of the blessing of the affections, and of the necessity of guarding and fostering them by all attainable means. When a child offers an indignity to his parent, society feels it as a common wound. When a matrimonial alliance is formed, in which the affections are obviously disregarded that some sordid interest may be consulted, all rightly-constituted persons experience a distressing sensation, as if some insult were offered to nature, and, through nature, to themselves. When an estrangement takes place between brothers, or any other nearly related persons fall into a quarrel, every individual who knows the parties experiences as real a shock, and as definite a pain, as if a blow were given. On the other hand, there are few things (apart from what immediately concern themselves) which so readily brighten the countenances of men, as to observe or to be informed of any instance in which relations live harmoniously, and in the habitual exercise of a loving kindness towards each other. We are all, in general, cold enough; of that there can be no doubt. Yet no man is so abandoned to the empire of an evil nature, that he will not survey with pleasure, and a contagious goodness, however transient, the tenderness, for instance, of a pure and gentle daughter towards a helpless parent—the devotion of an only son to a widowed mother—the friendship of brothers seeking to support each other against the general calamities of life. Such sights as these elevate and refine every nature, for they are all of heaven that has been left upon the earth.

It unfortunately happens, notwithstanding all the blessings to be derived from family affections, and the general respect which is sure to be paid to any instance of their being properly cultivated, that kinsmen often fall out, and that no hostility is so ill to heal as one between such parties. The principal causes of this may, we think, be easily traced, and some precautions may as easily be taken to obviate them.

It has pleased the Creator of the human race to inspire them with different dispositions, different likings and dislikes, and many various passions, which, if allowed free scope and exercise, would not only be vicious in themselves, but produce infinite mischief from the simple circumstance of their running foul of the passions and dispositions of others, and so leading to endless warfare among men. To prevent the diverse tastes and tendencies of mankind from jostling each other, society has established a conventional system of manners, known by the phrase "good breeding," which prevents one person from saying such things as he pleases, if the saying of such things be likely to displease others. This check, unfortunately, is of least avail in families, being there deranged in its exercise by the easiness and familiarity which near relationship and early habits have introduced, and even rendered in some measure laudable. As it is at the same time a fact in nature, that greater differences of disposition prevail among at least collateral relations, than what are to be found in an equal number of persons selected at random from the community, and as relations, moreover, are most frequently engaged in the transactions which are apt to produce contrariety of interest, and excite opposite natures, the result obviously must be, that dissensions more frequently take place among them than among other persons. When once offence has been given and taken among friends, it is easy to see that a reconciliation must be more difficult and hopeless than in any other case, since, even if there were no other causes, the very fact of the offence having been given by a friend must make it seem the less excusable.

Now, nothing can be clearer than that the true way to avoid such unhappy enmities is to call into exercise in families, if not the formal manners which are necessary to avoid divisions in general society, at least a greater share of that mutual bearing and forbearing which constitutes the best part of "good breeding." Some one has remarked with much force, that, as two hard substances are necessary to strike fire, so two obdurate natures are requisite in a quarrel. In all dissensions, each invariably thinks himself the innocent and ill-used party, and throws the whole blame upon his neighbour. But this is an absurdity in nature. If either had had a sincere desire to avoid quarrelling, a little endurance and a little forbearance—no matter from which side—would have had the effect. Did wrath come from one side!—would not "a soft word" from the other have "turned it away?" Hence, it may be observed, that an imperious and a yielding nature form a union little liable to be disturbed by quarrels. Let no one say that to be constantly giving way to the worse passions of a neighbour is an unmanly sacrifice, that ought not to be paid. "Peace, peace, peace," as the good Lord Falkland cried, "give us peace upon any terms." And, moreover, will the want of reason in one person excuse the want of a gentle spirit in another? Ought we not, rather, by yielding, to hold up an example to our less happily constituted friend, or, if all other good ends fail, by forgiveness heap coals of fire upon his head?

POPULAR INFORMATION ON SCIENCE.

GLACIERS.

No person can contemplate the surface of this earth without being impressed with a deep sense of the beauty and grandeur which in almost every country it exhibits. The sunny valley, the extended plain, the lofty ice-crowned mountain, alike manifest the presence of that power which pervades the whole visible creation. Well has the poet expressed this in the following invocation:—

> "Spirit of nature! This is thy fitting temple!
> Where not the lightest leaf
> That quivers to the passing breeze,
> But is instinct with thee!"

With minds thus prepared to be affected by the sublimity of the scenes we must now imagine, let us proceed to examine the origin and nature of those immense masses of ice which are termed glaciers, and which are found on the summits of high mountains. When we ascend from the surface of the earth into the higher regions of the atmosphere, we find that the air becomes rarified; the sun's rays, which impart warmth, are reflected round us with less intensity, and a sense of coldness is experienced. Saussure, in travelling over the Alps, found that the temperature of the air diminished one degree for every two hundred and eighty-seven feet that he ascended. Dr Heberden, in journeying over the Azores, found the thermometer fall one degree for every two hundred and forty-five feet. A thermometer, placed on the top of Arthur's Seat, will stand three degrees lower than another kept in a situation on a level with its base. Accordingly, it is found that snow exists in all countries at a certain height above the level of the sea, and this particular height is designated the "snow line." We must now, then, picture to ourselves a lofty chain of mountains—the range of the majestic Alps. When the traveller has ascended one of these mountains, he finds himself surrounded by colossal masses of ice. The snow which falls in these high regions is finer, drier, and more crystalline than that which, falling through a denser atmosphere more charged with vapour, reaches the lower region of the mountains. Most truly has the poet, in contemplating the summit of Mont Blanc, said—

> "Mont Blanc yet gleams on high: The power is there—
> The still and solemn power of many sights.
> * * * Winds contend
> Silently there, and heap the snow with breath,
> Rapid and strong—but silently."

The snow which thus accumulates on the tops of these mountains, agglomerates in a slow and irregular man-

ner, under the form of grains, into considerable masses, which, during the summer, are exposed to continual changes of temperature. The very keen cold of the night renders the surface of the mass so hard, that the footstep of the traveller makes no impression on it. The intense heat of the succeeding day, however, separates anew the snowy grains, and the water so melted, penetrating into the interstices thus produced, enlarges each grain by congealing round it. This operation proceeding for a considerable period, and on a great scale, at length gives rise to so compact a crystallized mass, that the rays of the sun have not power to melt it; instead of which, they produce an expansion of the air within the glacier, which gives rise to sudden and violent rents at the surface, which are often of considerable magnitude. "One day," says Professor Hugi, who explored the glaciers of the Alps, "being on the inferior glacier of the Aar during an intense heat, at three o'clock P.M. I heard a very peculiar noise. I advanced rapidly from thirty to forty paces from the side where the noise was heard; I felt the mass of the glacier shake by jolts under my feet, and I soon discovered the cause. A fissure was formed in an instant, the aperture was elongated from twelve to twenty feet, so that I was unable to follow its formation. Sometimes the operation seemed about to cease, and the mass separated itself very slowly; then, again, the fissure continued to open quickly, and by jolts. Many times I ran forward in time to see the separation taking place under my feet. I followed in this way the formation of the fissure over an extent of almost a quarter of a league, even to the border of the glacier, where it stopped. The fissure opened at first, under the first concussion, about an inch and a half, but afterwards it again contracted, so that its breadth did not attain to more than an inch. The interior of this fissure was rough and unequal; a part of the crystals were broken into two, and others almost untouched formed projections to which there were corresponding hollows in the opposite surface. * * * * During the whole of my stay on the inferior glacier of the Aar, we were awaked every night twice or thrice by the subterranean noises which proceeded from the interior of the glacier. Twice the bed itself, which we had dug in the glacier, and which was lined with slates and moss, was violently shaken by jolts analogous to those which I had observed during the formation of the fissure; but the shaking appeared so deeply seated, that we could not for a moment entertain the idea that any rent or crevice would open at the surface." Here we may for a moment pause, to reflect on the awe-inspiring effect of such a scene. It has been well described by Lord Byron, who has put these words into the lips of the gloomy and desperate Manfred:—

——"Ye toppling crags of ice!
Ye avalanches, whom a breath draws down
In mountains overwhelming, come and crush me!
I hear ye momently, above, beneath,
Crash with a frequent conflict; but ye pass,
And only fall on things that still would live;
On the young flourishing forest, or the hut
And hamlet of the harmless villager."

In connection with the rifts thus produced in these glaciers, we may quote the following observations and anecdote by Mr Bohr, who visited the glaciers on one of the high mountains in the interior of Norway:—"It is not," says he, "without terror that you look down into these fearful abysses, however beautiful their azure-coloured walls are. In their cold bottoms the lonely traveller has sometimes found his grave. A few years ago, a peasant crossing over from Justedal to Nordfiord, fell into one of these large clefts, which was concealed by the snow. His only companion, a faithful dog, ran down to Justedal, barking and howling as a signal for help. Nobody, however, comprehended his meaning, till the person who had fallen down was at last missed. Several persons then followed the dog up to the glacier, who stopped at the cleft, and gave such signs as put it beyond all doubt that his master had fallen into it. They threw down a rope, and made loud cries, but in vain; the peasant had met his death in the immeasurable gulf. It was only by compulsion that the dog would leave the cleft."

The ice of glaciers is often as hard as rock: the sun, the rain, and warm winds, slightly melt its surface, but never soften the whole mass. The colour of a small detached fragment of a glacier is white and clear; but if we examine a greater mass, as the thickness increases it becomes of a blue colour, gradually more deep; it is at first a sky-blue scarcely discernible, then a fine enamel blue, and, finally, a very deep azure blue. In some glaciers there is associated with the fine deep azure blue a small tint of sea-green, which sometimes predominates. In some places, especially in the fissures, the gradation of colours is very beautiful. In front of a glacier there is generally a pile of rubbish, consisting of rock, earth, and trees, which form a wall around it, known in Switzerland by the term MORAINE. If this line of moraine be some distance from the front of the glacier, it is considered that the glacier has retreated to the amount of that distance; but if there be no other than that which the glacier immediately drives before it, then it is considered to be on the increase. The glaciers, by melting at their under surface, occasionally descend along the sides of the mountain, or fall with tremendous crash into the subjacent vallies. In so doing they often transport blocks of very large dimensions along with them, occasioning the most frightful devastation where they fall. In 1774, many families who lived in Norway complained to the authorities that they could not pay their taxes in consequence of their crops having been entirely destroyed by the descent of the glaciers. When these avalanches fall, they do so with the noise of the loudest thunder, which reverberates through all the adjacent vallies. Huge masses of ice and snow, loosened from the sides of the mountains, are precipitated with prodigious force, and the ice, reduced to powder by the force of the fall, mounts like dust raised in a whirlwind, while the heavier materials still rush down in a tremendous torrent. We find in the Swiss journal of Lord Byron an interesting and accurate description of the effect. "Arrived at the foot of the Jungfrau; glaciers; torrents; one of these torrents nine hundred feet in height of visible descent; heard an avalanche fall like thunder; glaciers enormous; storm came on; thunder, lightning, hail, all in perfection, and beautiful. The torrent is in shape curving over the rock, like the tail of a white horse streaming in the wind, such as it might be conceived would be that of the pale horse mentioned in the Apocalypse. It is neither mist nor water, but a something between both; its immense height gives it a wave, a curve, a spreading here, or condensation there, wonderful and indescribable." Such falls are particularly common among the Alps, and alone disturb with their thunder the silence of these wild and dreary regions.

LEGEND OF MARSEILLES.

THERE is a tradition in Marseilles, that, on a particular night, about 200 years ago, all the clocks of that city were put forward one hour—a tradition which is said to have had its origin in the following story:—

There lived in the vicinity of that city a Monsieur Valette, a gentleman of ancient family, and of considerable fortune. He had married Maria Danville, daughter of the mayor of the city, a young lady who was from her beauty called "the Rose of Marseilles," and who united to every personal charm, dispositions the most amiable, and a mind the most accomplished. He had the happiness of seeing himself beloved by the most charming of her sex; a happiness not always enjoyed in France, where marriages are usually contracted by the parents, with too little regard to the affections of their children, and where the heart, therefore, is but too seldom given with the hand. It is on this account, perhaps, that the marriage state in that country is considered as one of more freedom to both parties than with us, where the affections are left less constrained in the choice of their object. M. Valette was blessed with two sons and two daughters, the fair fruit of a happy union, and he dwelt in a beautiful villa in the vicinity of the city, and commanding an extensive view of its fine bay; a seat which had been the favourite residence of his ancestors.

As his children grew up, however, he was induced to remove to Paris, which both he and Madame Valette conceived to be more favourable to the education of their family, though he was himself fond of rural retirement; a rare taste, amongst a people where all the noble and opulent flock to the capital, the seat of the court, and leave almost deserted one of the most picturesque and beautiful countries in the world. Hence it is that pastoral and descriptive poetry are so little relished or cultivated in France, where the pleasures of rural nature are either not fully appreciated, or connected with low and vulgar associations. The removal of M. Valette to Paris was deplored by his tenantry, to whom he had been as a father, but particularly as Monsieur Le Brun, whom he had left factor on his estate, was, though a just man, of harsh manners, and of a precise and unaccommodating temper.

M. Valette found it necessary in Paris, as all persons of distinction do, to mix with the gay and the fashionable: the time that had been given to the enjoyments of domestic retirement was now consumed in the giddy round of fashion and amusements, and his open and generous temper led him into a mode of life which but ill accorded with the moderation of his fortune. He made frequent demands on his factor for renewed remittances; and this man was forced to use rigorous and oppressive measures, to procure for his master the necessary means of expense. The scanty vintage of the preceding years had made such demands doubly hard to be obeyed; and Le Brun became as odious to the tenantry as Valette himself had been respected and beloved.

These circumstances were but too little known to Valette, or his generous soul would have revolted from a manner of life which wrung from the sweat of the labourer his hard-earned wages. One night, as he slept in Paris, the form of his factor appeared to him, covered with blood, informing him that he had been murdered by the tenantry on M. Valette's estate, for rigour in collecting his revenue, and his body buried under a particular tree, which he minutely described. The ghost of Le Brun, moreover, requested him that he would undertake an immediate journey to Marseilles, and deposit his remains in the tomb of his ancestors; a request the importance of which will be duly estimated by those who know the horror with which the Catholics contemplate the idea of having their remains deposited in ground which has not been consecrated by the church. To this request Valette assented, and the apparition immediately disappeared.

The morning came, to dissipate the gloom which the vision of the night had occasioned; and though he had been for some time astonished at the unusual silence of Le Brun, yet he could not help considering the whole as a mere illusion of the imagination. The stories of ghosts he had always considered as fit only for the nursery, and his manly and enlightened mind was wholly unimbued with the least tincture of credulity or superstition. To have taken so distant a journey, on such a pretence, he knew would be interpreted as the height of superstition; and he concealed an incident, the very relation of which must have subjected him to the ridicule of his acquaintance. "You are more thoughtful than usual, papa!" said one of his daughters to him next morning at breakfast. "I am thinking, my dear," said M. Valette, "why I have been so long in hearing from Le Brun. I need money, and my demands have not been supplied."

Night now came, again to usher in that period of reflection which the dissipation of the day had banished, and about the solemn hour of midnight, Le Brun again appeared, to reproach him for his negligence. There was an evident frown on his countenance; and he besought Valette why he had delayed to fulfil his earnest request? Valette again promised immediate obedience, and the night was no more disturbed by so unwelcome an intruder. Morning came again, the gaiety of which even the voice of sorrow can scarcely resist; and the same train of thoughts occurred to him as on the day preceding. "It must still be a dream," said he to himself, "though a remarkable one certainly. To-day will probably bring me the expected letters from Le Brun, and I must yet delay a journey which must subject me at once to ridicule and inconvenience."

The messengers from the dead seldom petition in vain; and the third night the expected vision appeared, with a terrible frown in his countenance, and reproached Valette for his want of friendship to the man whose blood had been spilt in his cause, and for disregard to the peace of his soul. "If you will grant my request," said the phantom, "I promise to give you twenty-four hours' warning of the time of your own death, to arrange your affairs, and to make your peace with God." M. Valette promised, in the most solemn manner, that he would set off next morning for Marseilles, to execute the awful commission; and, with a look of confidence in his words, the ghost of Le Brun vanished from his sight. Valette rose next day with the light, and alleging to his family that he had business of urgent necessity, which immediately called him to Marseilles, accompanied by a few faithful domestics, he departed to visit the seat of his ancestors, after an absence of ten years. There, alas! he found but too fatally realised the murder of Le Brun. Under the tree that had been so minutely described, and which grew in the solitary corner of an adjoining forest, he found the mangled remains, which, after the manner of his country, he caused to be decently interred in the family vault. He in vain, however, made every search for the murderers. The same cause which had occasioned the death of the unfortunate Le Brun, led the tenants to the most obstinate concealment of the manner of it; and Valette saw, with horror and regret, the miseries which they had suffered, in times of extreme difficulty, merely that he might be furnished with the means of extravagance. "Had I imagined," he exclaimed, "that my unsatisfactory pleasures would have cost so dear, I would long since have retired from fashionable life, and sought that happiness in the peaceful seclusion of a beautiful country, which was always most congenial to the wishes of my soul. I shall return to my estate," continued he, "that my children may learn to relish its beauties, and acquire an attachment to its tranquil pleasures, and to its simple inhabitants. May the blood which has been shed prove a memorable lesson to my sons of the misery of extravagance, and the guilt of oppression." Impressed with such reflections, M. Valette no sooner returned to Paris, than he communicated to his accomplished partner, the once "peerless Rose of Marseilles," and the still lovely mother of a virtuous offspring, the matured and unalterable purpose of his soul. Madame Valette, having accomplished the principal object of her residence in Paris—the education of her family—assented with pleasure to a return to those tranquil enjoyments which were ever dearest to her heart. In little more than a year, they found themselves again in the chateau of their ancestors, and their return was hailed by a delighted tenantry—by the widow and the fatherless—by the indigent and the afflicted. To relieve the distresses of the poor was neither the least important nor pleasant employments of this benevolent family, and on them descended the blessings of those who were ready to perish.

About eight years after their return from Paris, the family mansion demanding repairs, they found it necessary, for some time, to remove to Marseilles, where they resided in the house of M. Danville, the father of Madame Valette. Time, which wears away even the rocks of the earth, had weakened the impression of his dream from the mind of Valette, and cares of a more tender and domestic nature chiefly occupied his thoughts.

Sitting one night, after supper, in the midst of his happy family, a loud and sudden knocking was heard at the gate; but when the servant went to open it, he found nobody without. After a short interval, the same loud knocking was again heard, and one of Valette's sons accompanied the servant to the gate, to see who demanded admittance at so unseasonable an hour; but, to their astonishment, no one was to be seen there

neither. A third time the knocking was repeated still louder and louder, and a sudden thought darted across the mind of Valette, that this was the ghost of Le Brun, come to fulfil his awful promise. "I will go to the gate myself," said he; "I believe I know who it is that knocks." This presentiment was too truly realised. As he opened the gate, the factor appeared, whispered to him, that next night, at the same time, for it was now the twelfth hour, he must prepare himself to leave the world!—then, waving his hand, as if to bid adieu, the ghost of Le Brun disappeared, to return no more.

M. Valette returned, pale and ghastly as the phantom he had seen, to his happy domestic circle; and, upon their anxious and urgent inquiries as to the cause of his uneasiness, related, for the first time, the incident of the dream, and the promised warning which he had just received. A sudden gloom and melancholy was spread over the faces of all present. Madame Valette threw her arms round the neck of her husband, and embraced him with tears; while his lovely daughters clung round his knees, exclaiming, "that they never could outlive so good a father!" M. Danville, however, obstinately declared his incredulity, and considered the whole as one of those unaccountable illusions to which even the strongest minds are sometimes liable. He viewed it like the apparition which appeared to Brutus before the battle of Philippi, while that great but unfortunate patriot was sitting lone and melancholy in his tent. No sooner had M. Valette retired to his apartment, than M. Danville endeavoured to impress the same opinion on the family of his son-in-law. Apprehensive lest the very imagination of the event might occasion it, or at least be attended by disagreeable consequences, he thought upon a device, which, as mayor of the city, it was in his power easily to accomplish. This was to cause all the clocks of Marseilles to be put forward one hour, that they might strike the predicted hour of twelve next night, when it should only be eleven; so that, if there really were any thing in the warning of the ghost, when the time should be believed by Valette to have passed over without any event supervening, he might be persuaded to dissipate the imagination with which he was so deeply impressed.

Next day the unhappy Valette made every effort to arrange his worldly affairs according to his wishes, procured his will to be executed in legal form, received the sacrament, and prepared himself with all decency and solemnity for the awful event which he anticipated. The evening approached. From a large open window, which looked into a beautiful garden, and commanded an extensive view into the surrounding country, he saw the sun go down, as he believed, for the last time. For the last time he beheld its blessed light irradiate the blue heavens, and gladden the green earth. He thought the myrtles and acacias, as they bowed their limber heads to the breeze, waved him a last adieu. He imagined that the fountains, that threw their drizzling spray on high, fell back into their basins with a more plaintive murmur. The shadows of night now came down upon the world, which he believed were to usher him in to the darkness of the grave. He beheld the stars twinkle in the azure heaven with a milder radiance than usual. He viewed with tears of affection the wife of his bosom, and his beloved children, sitting around him, with looks of concealed thoughtfulness and sorrow. "To leave you, the dearest objects of my affection," said he within himself, "gives to death all its anguish. It were not heaven to be without you. But we part to meet again."

He considered himself like a criminal doomed to death, waiting the hour of his execution, and counting the few remaining moments he had to live. The lamps were now lighted in the hall; and he sat in the midst of his family, and partook of the last supper which he believed he was ever to eat upon earth. The clocks of Marseilles tolled the eleventh hour. "My dearest Maria," said he to Madame Valette, "I have now only one hour to live. There is to me but one hour betwixt time and eternity." It approached. There was an unusual silence in the company. The twelfth hour struck, when, rising up, he exclaimed, "Jesu! Maria! have mercy on my soul! my hour is come!" He heard the hour distinctly ring out through all the bells in Marseilles. "The Angel of Death," said he, "delays his coming. Could all have been an illusion? No, it is impossible!" Here M. Danville interposed. "The ghost," said he, with a tone of irony, "has deceived you. He is one of the lying prophets of Ahab. Are you not yet safe? Consider the whole as a powerful illusion of the imagination, and banish, my friend, a thought which so completely overwhelms you." "Well," rejoined Valette, "God's will be done: I shall retire to my chamber, and spend the night in prayer for so signal a deliverance; for so I must always consider it." M. Danville secretly congratulated himself on the success of his device: they parted—never to meet again!

After having been nearly an hour in his bed-chamber, M. Valette recollected that he had left, by mistake, in his library, a document of importance to his family, unsigned, to which it was necessary his name should be affixed. In passing from his bed-chamber to his library, he had to cross by the head of a flight of stairs, which led immediately down to the cellar where M. Danville kept his choicest wines. At this spot he heard a confused noise of voices underneath, and instantly ran down to the bottom of the stairs to ascertain the cause. But no sooner had he descended, than an unseen arm stabbed him to the heart. At this fatal moment, all the clocks in Marseilles, which are mentioned to have been put forward one hour, now struck one in the morning, or, as it should have been, twelve at night, the exact time predicted by the ghost of Le Brun.

The fact was, the cellar of M. Danville had at that period been broken into by robbers, who, perceiving themselves discovered, saw no other means of escape, than by murdering the ill-fated Valette, by whom they had been surprised. But these men were the unconscious instruments in the hands of fate. The dagger that stabbed Valette to the heart proved that the decrees of Heaven are irresistible, and that there is an hour appointed for all the posterity of Adam.

Such is the reason, according to the tradition in Marseilles, why, on one particular night, all the clocks in that city had been put forward one hour.—*Edinburgh Magazine*, 1822.

THE SOURCES OF THE DEE.

MATTERS have changed since we sent our readers, some weeks ago, on a mental trip to the banks of the Dee; and now a hot sun basks on the green leaves, and the choicest flowers of spring exultingly raise their gay heads, to suck in its light and heat; but *we* can only peer at these things from beneath a heap of nightcaps and flannel, for the influenza has laid his ugly hands upon us; when we are rid of it, we intend to rush to some unknown quarter of the country, and loll for a week among green leaves, heather, and cold wild-flowers, till our blood recovers its equilibrium; for meanwhile, although fully as weak as water, we are not nearly so cool as a zephyr. But it will be some time ere this consummation can arrive; so, meanwhile, we shall try to enjoy, in the company of our kind reader, a continuation of the mental expedition to the sources of the Dee.

We left our reader sound asleep at Braemar. He has got up early in the morning, and ate a good breakfast, consisting of six cups of tea, some beefsteaks, ham, cold beef, trout (red and white), kipper salmon, oat and wheaten bread, marmalade, and honey. Some wise people are in the habit, when they wish to penetrate into these remote regions, of hiring a guide; and so some ragged Highland blackguard, whose day's labour might at a stretch be worth 6d., hires himself out, to devour their sandwiches, and bread and cheese, and drink their spirits, at some twenty times the amount. We never employed one of these vagabonds, to tell us—"Ay, ta pretty hill, but no ken her name; na, na, sir, nae name; there are nae hill has a name here but ta Cairngorm and ta Benmuichdhui." And—"the water, sir—oh, jist the water—nae ither name—nane o' the waters has names." We never at any period we can recollect managed to lose ourself, or, in other words, to be unable to say to ourself on an inquiry, "here, sir." As to the circumstance of being unable to state (like the Highlander we have depicted) the name of the spot of ground we may happen to be upon, that is a matter of very little consequence, and fully as likely to happen, as we have shown, *with* a guide as without one. Let the traveller recollect he does not live in unhappy Ireland, where a man may be fifteen miles from "innay whare," and to be in any somewhere among these mountains is always to be in an interesting spot. We have sometimes wandered a county or two astray among them, but always found our way back; and, indeed, we do not advise any one to think himself of so much consequence that it will trouble any body whether he comes back or not. The road winds itself by degrees out of the village of Braemar, till it again buries itself among majestic trees, over whose heads the tops of the stony mountains only are to be seen. Sometimes, indeed, there is a large break, or the road winds round a terrace some hundred feet above the diminished Dee, and then the full glory of a Highland strath bursts on the view—the great expansive valley, with its fair winding stream, the grass, the cattle, the cultivated fields, the abodes of men, the thousands of trees, the rocks protruding themselves here and there into the space, not bare and craggy, but green with moss and birch trees; and then round the quiet, smiling glen, the great brown hills, showing here and there the gaps which lead to their own dark vallies, where there is no grass, or culture, or human habitation, and where storm only breaks the eternal silence which reigns among them. The farther you proceed, recollect you are gradually leaving mankind behind you. The hamlets, if any clump of houses above Braemar is entitled to that cumulative denomination, become more scattered and savage; the human beings assume more the appearance of dwellers in the wilderness; their look is no longer the passing glance of idle curiosity, but the deep, wild, profound stare of those whose thoughts are seldom interrupted by the sight of man. There is an appearance of wild indolence and pristine dependence on self for all the necessaries of life, which show that the laborious efforts of the Highland Society have hardly fulfilled their aim here. It is a striking instance of the repulsiveness human beings frequently feel towards improvement—a repulsiveness we shall not join some philosophers in adopting as a peculiarity of the Celtic race, that, in a country which we suppose has reached a more artificial state than any other—where the division of labour is carried farther than in any other—where the nice commercial speculations of political economists are more nearly followed up in practice—where a more complicated system of police keeps the vast body of society in health and motion than is, perhaps, used in any other country—here should be a district where the inhabitants live with almost the simplicity of the hunters of the desert—where they are, at most, not above the pastoral state—and where their living within the corner of the laws which have deprived them of the means, seems alone to have prevented them from using the soil as common property, and living by barter. Here the people seem to refuse the hand which leads. By far the most comfortable, respectable, and active-looking part of the population, appears to be the dogs. They may here be numbered at about one-third more than the human beings, and the interminable noise with which they assail a foot-passenger has made us often tremble at the very idea of what a man on horseback would have to suffer. Having moralized about half a dozen times for each house which occurs within the ten miles betwixt Braemar and the Lin of Dee, we cannot avoid requesting you to look at the last miserable clump of hovels, as it surrounds a rather peculiar object. A bit of bare wall raises itself about thirty feet high, with here and there a slit or narrow window; that ruin is the remains of Inverey, the seat of that Farquharson known to the lovers of our ancient ballads as the slayer of the worthy Baron of Bracklay: he was a Highland freebooter, or, more properly, thief; probably one of those whom a false taste in the age has appreciated as a man of high moral honour, according to a particular code, and acting the part of a marauder, merely from a principle of wild independence. Presuming us, however, to have had the honour of his acquaintance, we rather think that, notwithstanding his alleged penchant for cows and sheep (the most attractive moveables likely to come in his way), we should have felt diffident in trusting him with a watch or a silver spoon. We cannot, in passing, avoid casting a glance at the views which some people in this civilized age direct towards the vices of savages, and feel convinced that the feeling considerably obstructs the improvement of our Highlands. We have now brought you, in the midst of our sensible conversation, to one of the lions of this neighbourhood—the Lin of Dee: you will hardly find it to be what you probably expected—a lofty waterfall: the fall is indeed very insignificant, and it is over a sloping bank, from which there is no leap; but in no waterfall, not even in the princely Foyers, do we behold such a terrible specimen of the imprisoned power of the watery element. Here it has got itself entangled in a complete nest of impenetrable granite rocks, which alternately confine and enlarge the noble stream, sometimes allowing its waters to sweep indignantly round and round some large black basin, then again compelling them to exhaust their rage in cleaving their way betwixt two ledges, so near each other, that it is very easy, and a very common practice with those who have sound clear heads, to step across. Here the dead white of the foam contrasts strongly with the blackness of the turbulent cauldrons, and the still blacker recesses of the caverns under the rocks, which an occasional commotion of the surface more violent than usual sometimes exhibits. It is said by the people in the neighbourhood, that the body of any living being which finds its way into the lin, can never be recovered, and, making allowance for generalities, we can easily imagine that in most cases they find their way into these abhorred caverns. We recollect, in the time of a flood, thinking the Lin of Dee would be a fine sight: we went, and were rather disappointed: the water had risen above the narrow broken part of the rocks, and its surface had a wider channel: it darted betwixt the banks with the velocity of the lightning, smooth and unruffled. But of what description must have been the working beneath! Come along, you will gaze into those black surgey depths till your eyes are fascinated and your head giddy: you will have opportunity for the exercise of fortitude elsewhere, for we are just entering the desert. There are two strange-looking hovels, a mile or so beyond the lin, with each its piece of cultivated land about it, to supply the necessaries of life, unfenced, and unprovided with any thing to distinguish it from the uncultivated hills but the freshness of its colour. Gradually what was something like a road, dies away; and you are now compelled to pick your way among the stones, and through the long heather, occasionally meeting with one of the small tracks worn by the deer, and used by such scanty travellers as may pass through that savage wilderness. There is a peculiar effect of loneliness you may never perhaps have experienced before, on entering this wilderness. The hills are at first distant, and the glen wide and hollow; but a dead stillness reigns on every thing, except on the clattering river, which still flows on in no unstately bulk. Wandering on, mile after mile, the glen gradually narrows, and gets more savage in its aspect; great black rocks, which look like the stone walls of some antediluvian city of the giants, begin to run themselves up on each side; they approach more and more towards each other; and at last the solitary spectator feels as if they impeded his breath, although they are some miles, perhaps, from each other. It is time we should tell him exactly where he is: yonder singular looking peak, with shaggy precipitous sides, towards

the west, is Cairntoul; proceeding from its side, as a wall seems to proceed from the angle of a turret, is a vast black mass of perpendicular rock; that is the Ridge of Braeriach, said, by an eminent calculator of altitudes, to have two thousand feet of sheer precipice; that two thousand feet of precipice is the object which it now almost aches your eyes to look upon—a flat black mass, streaked with snow, and sometimes intruded on by a cloud, which divides the upper regions from the lower. It is probable that now, in mid-day, a hot sun gilds its black front, and mocks its streaks of snow, while a dead unearthly silence pervades the mass. It is not so at all times; for here is the workshop of storms—here the elements, when they prepare themselves to come down with destruction on the fruitful valleys below, exercise their strength and do no harm; then the scene is different from the stillness of the present; but with your leave, reader, it is a change we do not wish to witness. Returning to the description of our glen: right ahead, and almost protruding into it, is the well-known Cairngorm; and towards the east, stretched the loftier Benmuichdhui, now admitted to be the highest hill in Britain; but we shall have, henceforth, to describe some of its numerous appearances. Now, after having heard the names of these mighty objects, let us request you to indulge yourself in the feeling of striking loneliness and disconnection with the world which every thing you view seems to impose on you; and if you may not have perceived it before, you will now feel the full expressiveness of the terms in those lines by Hogg, where he says,

> Beyond the grizzly cliffs which guard
> The infant hills of Highland Dee,
> Where hunter's horn was never heard,
> Nor bugle of the forest bee,
> Mid wastes that dern and dreary lie,
> One mountain rears its mighty form,
> Disturbs the moon in passing bye,
> And smiles above the thunder storm.
>
> *Queen's Wake*, 95-6.

The Dee is still a respectable stream, but we are gradually running it to earth. Ascending its brawling course, where it toils over large stones, and winds round the bases of rocks, we suddenly reach a mound of great round stones, from which it issues, gurgling and boiling at several outlets, seeming with difficulty to force itself through. Ascending the mound of stones, where we hear a deep hollow gurgling beneath our feet, we find on its summit a small, round, deep green lake, whose pure cold surface is here and there slightly disturbed by the bubbling up from the bottom of numberless springs. The water is of a beautiful pale green, so clear that you can see the sand and stones at the bottom, almost as distinctly as through the air, where the water must be some fathoms deep. This pool of water, then, reader, so singularly placed in the midst of the wilderness, is the source of that Dee which carries civilization, fruitfulness, and commerce, through a great district of Scotland, waters many a broad acre of wood and corn, and harbours the shipping of a great commercial city. Here we bid you for a while adieu, leaving you to reflect, and to eat your dinner in peace.

THE DRAMA IN OLD TIMES.

(First Article.)

The Drama, and the acting of plays, originated in Greece during the time of Solon, the famous Athenian law-giver, about 530 years before Christ, and seems to have taken its rise from a very simple institution. Icarius, an inhabitant of Attica, it is said, who had learned from Bacchus the art of cultivating the vine, one day observed a goat destroying his grapes. Having seized the animal, he sacrificed it to Bacchus; and the neighbouring peasants danced around the victim, and joined in a song celebrating the praises of the god. This has given origin to our word Tragedy, which is made up of two Greek words, signifying the *song of the goat*; and, hence, it appears that Tragedy was, at first, with them, only a sacred hymn. The ceremony then grew into a festival, and the festival into an annual solemnity, which, in process of time, assumed all the pomp and splendour of religious ceremonies. Poets were employed by the magistrates to compose hymns or songs for the occasion; and such was the rudeness and simplicity of the age, that their bards contended for a prize, which, as Horace intimates, was scarce worth contending for, being no more than a goat, or a goat-skin of wine, which was given to the successful competitor.

This ceremony was so much suited to the taste of the rude age in which Icarius lived, that it was frequently repeated by those who had witnessed it, and soon became a favourite amusement throughout Attica. The poets appointed to compose the verses sung in honour of the god, finding little room for the display of their genius, while confined to a topic uninteresting in itself, and exhausted by those before them, began gradually to vary the subject of their odes; and, in the days of Solon, Thespis, a famous poet, made the first considerable improvement, by introducing a single person, whose business was to relieve the *chorus*, as the company of singing peasants was called, by the recital of some extraordinary adventure. Thespis's object in introducing this new person appears to have been simply to afford the chorus some time for rest. All that the actor repeated between the songs of the chorus was called an *episode*, or additional part, consisting often of different adventures, which had no connection with each other. Thus the chorus, or song, which was at first the only, and for a long time the principal performance, became gradually a subordinate and inconsiderable, but, at the same time, according to their notions, an indispensable part of the Greek drama. From this time, it is probable that the actor or reciter was more attended to than the chorus, as his part had the charm of narrative to recommend it; and the songs of the chorus, also, began now to wander almost entirely from their original subject in praise of Bacchus, and, in fact, spoke so little of the god of the vintage, that the priests exclaimed against the neglect of him, and their complaint grew into a proverb among the Greeks. Thespis besmeared the faces of his actors with the lees of wine, either for drollery or to disguise them; and he carried his troop from village to village in a waggon, from which they performed their pieces. Alcestis was the name of the first representation, having the appearance of a play, which was performed at Athens: this was 536 years before Christ, and almost four hundred years after the time when epic poetry may be said to have been brought to perfection by Homer. From Thespis it is still common to apply to playactors the appellation of *Thespians*.

Within a few years from this first improvement on the choral songs, arose a poet of great ability, named Æschylus, who improved both the writing and the representation of plays. He was born at Athens, most probably, about 525 years before Christ, and was present at the celebrated victory of Marathon, thirty-five years after, by which the Athenians saved their country from the grasp of the Persians. He is said to have here given proofs of great bravery, as well as at the subsequent victories of Salamis and Platæa.

The grand improvement which Æschylus introduced into the *acting* of the drama consisted in his exchanging the cart of Thespis for a regular and well-constructed theatre. He introduced, also, scenery and decorations; raised his heroes on the cothurnus or buskin, a kind of large boot; invented masks; and brought in splendid habits with sweeping trains, that gave an air of dignity to his performers. He was himself author, actor, and manager, and took upon him the whole conduct of the drama. In the poetical department, he displayed so much merit that he acquired, and still bears, the title of the Father of Tragedy, as if all that had gone before him were unworthy of consideration. He must decidedly be considered the originator of what we now call the drama, for he was the first who introduced more characters than one into the *recitative* part of the plays. In his tragedies there are always various characters who dress and speak in an appropriate manner, and whose united action and dialogue bring out the story which the single character of Thespis only narrated. He is said to have been encouraged by Bacchus in a dream to attempt this description of poetry; but if such were the case, the god of wine must certainly be considered as having dealt a great blow thereby to his own worship, as plays henceforward departed altogether from the original idea of songs in his praise. Yet the tragedy was still a very simple species of composition; and, in order to form any just notion of its primitive structure as introduced by Æschylus, we must first of all dismiss from our minds the idea inculcated by the general mode of printing the Greek plays, that they were divided, like our own, into five acts. The ancient Greek drama was, in fact, undivided. The oldest editions of the Greek tragedies do not so much as mark a separation of the scenes; and the word *act* does not occur in the treatise in which Aristotle gives us a definition of every part of the national drama. They seem to have recognised in their pieces only the general divisions of a beginning, a middle, and an end, under the names of the *prologue*, *episode*, and *exode*. The *prologue* comprehended the whole opening or exposition of the piece, containing all the circumstances necessary to be known, and which might give an insight into the plot. By the *episode* was meant all the part of the play containing the substance of the plot; and the *exode* contained all the unravelling or catastrophe. But the most remarkable feature of difference between these dramas and our own was certainly the chorus, a group of personages not uninterested in the issue of the events that were going on, but acting chiefly as advisers and confidents of the principal characters. As the chief personages of the drama were supposed to be too busy and impassioned in the course of events, the chorus uttered whatever moral reflections the scene suggested; they augmented the pomp of the scene by their parades, and they heightened the delight by their music, vocal and instrumental, as also (though it ill accords with our idea of the serious drama) by their dancing. In fact, the ancient Greek tragedy must have borne a strong resemblance to the modern Italian opera. The number of persons composing the chorus was probably at first indiscriminate. Æschylus, we are told, brought no less than fifty into his play, entitled, "Eumenides," but was obliged, by the civil authority, to reduce them to twelve. Sophocles, the next great dramatist, was afterwards permitted to add three, a limitation which it is generally supposed became a rule to succeeding poets.

The stories of Æschylus's plays are extremely simple; there is little action or plot, and every thing is brought about in the most common and natural manner. Only seven pieces, out of ten times the number which he is said to have written, have descended to our times. All these tragedies betray the infancy of the dramatic art; their beauties are rather epic than tragic; they display a genius of bold and gigantic, but of rude character, reared on the poetry of Homer, and, in fact, doing little more than dramatizing his scenes. Æschylus himself used to say that they were but scraps from the feast of the Iliad. His seven pieces that have reached us, are, *The Prometheus Bound*, *The Persians*, *The Seven Chiefs before Thebes*, *The Suppliants*, *Agamemnon*, *The Furies*, and *The Chæphoræ*. The plot of *The Prometheus* is perhaps as meagre and uninteresting as could well be conceived to form the groundwork of a tragedy. The story is that of Prometheus being sentenced by Jupiter to be fastened with chains to a rock on Mount Caucasus, with an eagle set to eat his liver everlastingly, as a punishment for his having presumed to steal fire from heaven, wherewith to animate a man which he had *formed*, and to communicate the use of it to mortals. The whole persons of the drama consist of the following individuals, viz. *Strength* and *Violence*, *Vulcan*, *Prometheus*, *Chorus of Ocean Nymphs*, *Oceanus*, *Io* or *Inakou*, *Mercury*.—*Scene*, *A desert in Scythia*. Such a programme would scarcely be considered interesting enough to attract the attention of a modern audience, and certainly stands much in need of great sublimity of language and loftiness of ideas to set it off. The subject is, indeed, too mythological to be interesting; as we have only Vulcan, accompanied by Strength and Violence, chaining Prometheus to the rock—the Ocean, and the Ocean Nymphs, and Io, coming to listen to the complaints of Prometheus, whom Mercury summons to tell the secret of which he boasts, namely, the means which Jupiter may employ to save himself from being one day hurled from the throne of heaven. Prometheus haughtily persists in refusing to tell the secret—the thunder descends, and the sufferer is left to his rock and tormenting vulture for ever. In all this, it is difficult to discover any thing moral or affecting.

Æschylus seems to have chiefly desired to excite sentiments of terror and admiration; and, to do him justice, it must be acknowledged that few dramatic writers have surpassed him in exciting these passions. His style is exceedingly forcible, abounding in bold and unusual metaphors, generally pompous, and frequently sublime, but often, also, so very obscure, that it is no easy matter to find out his meaning. The speech of Cassandra the prophetess, in his tragedy of Agamemnon, is said to have been considered by the ancients as his masterpiece; and modern critics have declared, that there is hardly any more striking instance of the united moral and physical sublime, than the concluding lines of his Prometheus Bound.

In order to give our readers an idea of the style in which these pieces are written, we shall give a short extract of a literal prose translation of the "Prometheus," and a specimen of one in verse of the "Agamemnon."

Strength and Violence, Prometheus, Vulcan.

STRENGTH.

"We have now come into a far-distant region of the earth, into a Scythian tract, into a pathless desert: and it is now necessary, O Vulcan, that you be careful of the orders which Father (Jupiter) committed to you, to bind this miscreant to these lofty precipitous rocks, with firm fetters of adamantine chains: for, having stolen the bright radiance of fire, present in every art, and your glory,* he bestowed it upon mortals; for which offence he must suffer punishment from the gods, that he may learn to submit to the sovereignty of Jupiter, and cease from his philanthropic disposition.

VULCAN.

Strength and Violence, as far as regards you, indeed, the command of Jupiter is accomplished, and there is no further impediment. But I am unwilling to bind a god, my relation, to this precipice, exposed to the weather. But yet it is necessary for me to make the attempt; for it is dangerous to temporise with the words of Father Jupiter. O ingenious son of upright Themis (Prometheus), I am going unwillingly to fasten you reluctant with indissoluble bonds, and in a desolate region, where you shall neither hear the voice nor see the appearance of mortals; but, stat onary under the bright rays of the sun, you will lose the bloom of your colour, and the variegated night will conceal the light from you desirous of it, and the sun will again dissipate the hoar-frost of the morning; and the burden of your misfortune being

* Vulcan, as is well known, was considered by the ancients as the God of Fire.

always present, will torment you: for there is no where in existence any one who will relieve you. Such is the reward of your philanthropic disposition. For, yourself a god, and not regarding the anger of the gods, contrary to justice you conferred their honours upon mortals: wherefore, you shall keep watch at this dismal rock, standing upright, sleepless, not bending a knee. And you will utter many complaints and unavailing lamentations; for the mind of Jupiter is inexorable, and every one who is newly in power is harsh.

STRENGTH.

Be it so: why do you hesitate and delay to no purpose? Why should you not hate a deity very odious to the gods, who has conferred your honour on mortals?

VULCAN.

Kindred and intimacy is strong.

STRENGTH.

I confess it is; but how should you disobey the commands of Jupiter? Are you not afraid of this rather?

VULCAN.

You are, indeed, always cruel, and full of audacity.

STRENGTH.

(Yes, I am.) For it is no remedy to bewail him; and do not you labour in vain upon what will do no good.

VULCAN.

O, dexterity of hand, much to be hated!

STRENGTH.

Why do you hate it? for, in truth, your art is not at all the cause of his present distresses.

VULCAN.

I wish, however, the lot had fallen to some other person."

Such is a specimen of the dialogue in the "Prometheus," which presents, in fact, the first regular attempt at the dramatic art which has come down to modern times.

Æschylus's tragedy on the death of Agamemnon has beauties of a higher cast. There is, it is true, too much exposition of the catastrophe before it happens, and the atrocity of Clytemnestra, the Lady Macbeth of the story, is frigid, and unexplained by sufficient motives. The tragedy, however, has traits of sublime and impressive terror in the part of Cassandra, the Trojan prophetess, who is brought home a captive to Argos by Agamemnon, and foresees, though she cannot communicate her prediction, so as to be intelligible to those whom she warns of the impending murder of Agamemnon, by his wife Clytemnestra. The passage is peculiarly fine, when the chorus thus address her:—

"Thy own woes thou wailest,
In mournful melody, like the sweet bird
That darkling pours her never-ceasing plaint,
——— And wastes,
In sweetest woe, her melancholy life."

She replies—

"Ah, me! the fortune of the nightingale
Is to be envied; on her light-poised plumes
She wings at will her easy way, nor knows
The anguish of a tear; whilst on my head
The impending sword threatens a fatal wound."

There is great energy in one of the subsequent bursts of her agony:

"I burn, I burn, Apollo! oh, Apollo!
This lioness, that in a sensual sty
Rolled with the wolf (the generous lion absent),
Will kill me! and the sorceress, as she brews
Her filtered cup, will drug it with my blood.
She glories as against her husband's life
She whets the axe—her vengeance falls on him;
For that he came accompanied by me.
Why do I longer wear these useless honours,
This laurel wand, and these prophetic wreaths?
Away!—Before I die, I cast you from me.
* * * * * * *
Thou sun, whose rising beams shall bless no more
These closing eyes! you, whose vindictive rage
Hangs o'er my hated murderers, avenge me!
* * * * * * *
This is the state of man; a passing shadow
Throws down the baseless fabric of his joy;
And when the tablet of his fleeting state
Is character'd with all felicity,
Comes malice with a sponge moistened in gall,
And wipes the beauteous images away."*

Of all Æschylus's dramas, the one entitled "Chœphoræ," or the female worshippers, is perhaps the first piece deserving the name of a regular tragedy, as his other pieces can hardly be pronounced more than terrific theatrical pageants. The modesty of this poet seems to have been equal to his merit, since he entitled his tragedies "Fragments from the Splendid Banquet of Homer;" and if his epitaph was really written by himself, as is commonly asserted, he considered it as more glorious to have contributed to the victory at Marathon than to have excelled others by his genius. Towards the close of his life, he withdrew himself from Athens, and retired to the court of Hiero, king of Syracuse, in the island of Sicily, where he died in the 69th year of his age. Various reasons have been assigned for his retirement from his native country; but the most general opinion is, that he was unable to bear the preference given to his rival, Sophocles, the next great dramatic writer, who at this time began to rise in fame, and of whom some account will be given in the next article.

* See Edinburgh Encyclopædia, article Drama.

PRIVATE LIFE OF JAMES THE FIFTH OF SCOTLAND.

James the Fifth of Scotland was contemporary with Henry the Eighth of England, to whom he stood in the relation of nephew. He began his reign in 1513, when only about a year old, his father James the Fourth having then died in battle. In general, he is allowed to have been a gallant and generous prince, notwithstanding some instances of severity against certain of his subjects, particularly the reformers of religion, and also a rashness of temper, which led him into too many collisions with the superior power of England.

Many traditionary anecdotes are preserved of the adventures of this prince, when travelling in lowly disguise among his subjects; a practice which he seems to have assumed, partly for the prosecution of vagrant amours, and partly that, like the Caliph Haroun, he might detect any thing that was amiss in the administration of his inferior officers. Some humorous poems, descriptive of these adventures, are also preserved, and are generally thought to have been his own composition. Upon the whole, James may be described as an ingenious and interesting person. At the time when he lived, those controversies in church and state which have since rent mankind in twain, were just beginning to be heard of. Kings had then an easy time of it. Their word was generally law. Their lives were one uninterrupted scene of sport and amusement. Their people, gratified by the personal familiarity and condescension of the sovereign, forgot the arbitrary power which he could, if he chose, exercise over them. Withal, there was then a general homeliness of manners, and a simplicity in the whole system of society, which rendered the king less like a being exalted over his subjects than their companion and friend. James the Fifth, in particular, from his so systematically taking part with the poor against the noble, was honoured with the epithet of "The Commons' King."

Some years ago, the Earl of Aberdeen introduced a paper into the Antiquarian Society (London) respecting the Household Book of this prince, from which it appeared that the whole annual sum then spent by a Scottish king was about two thousand pounds of our present money, or less than a half of the salary of the American president. His Household Book is speedily to be published by the Bannatyne Club, and will, of course, speak for itself. In the mean time, we propose to arrange a few particulars from the books of the royal treasurer, in such a manner as to afford some view of the domestic life and habits of the monarch; following up, in fact, the article formerly given in the Journal respecting the private life of James the Fourth.*

The feature which strikes us most forcibly in contemplating the domestic establishments of the ancient Scottish princes, is the air of barbarous magnificence and rude grandeur which they exhibit—a character which they derive from the want of harmony or keeping, as a painter would call it, between their component parts. Thus we find their tables themselves huge clumsy masses of oak, with thick square legs, covered with costly and richly wrought gold plate and silver work—the walls hung with magnificent tapestry, which, by the way, was removed from one residence to another with the removal of the household—the floors uncarpeted—the fire-place exhibiting a grate such as a Cowgate broker of the present day would refrain from placing at his door, from pure despair of its obtaining a customer—the frame-work of their beds such as no country cartwright now-a-days would put out of his hands; though, to compensate for this, the clumsy mis-shapen posts and rude workmanship throughout were concealed with coverings of the richest and most showy velvets, and the curtains were of splendid damask, fringed and tasselled with gold. One remarkable characteristic of this universal article of household plenishing, as exhibited in ancient relics, is worthy of notice, as it adds another to the many instances of the capriciousness of taste and fashion—we allude to the extreme lowness of the beds of former days: they seldom rose above eight or ten inches from the floor. In modern times, they have been known to rise nearly as many feet, or at least to such a height as required the aid of a ladder. They are, however, we incline to think, again subsiding to their original level, and it is not improbable but they may, in the course of time, sink even below it.

* We are enabled to do this by the recent publication of a liberal series of extracts from the Treasurer's books, in the tenth and concluding *part* of Mr Pitcairn's invaluable work—the Criminal Trials.

The first appearance of the young king, in my lord treasurer's accounts, is sufficiently appropriate. It is for a present of 24 "elnis of rowane russat, to mak gownis to the kingis nurrises and rokkaris" (nurses and rockers of his cradle), of whom there appear to have been, altogether, no fewer than six. Of the cradle itself, there is no mention made; but we find, twenty-four years afterwards, when the young monarch had lived to have children of his own, his sons thus spoken of—"sent to St Androis to be ane cover to my lord prince's cradle, 4½ elnis crammessy velvet;" and immediately after, another cover, consisting of "7 elnis of reid velvet," with abundance of fringes of red silk, and blankets of "quhite fustane." Thus, supposing the infant king's cradle not to differ much from that furnished to his own offspring at an after period, the receptacle of the embryo monarch must have been a very splendid and costly one, with its velvet covers, silk fringes, and fustian blankets.

In these very curious and highly interesting accounts, we trace the king almost from his cradle to his grave. He soon advances, and we next find him (1518), under the tuition of Maister Gawin Dunbar—a circumstance intimated by the following entry:—"To Maister Gawin Dunbar, the kingis maister, for expensis made be him in reparating of the chalmer in the quhilk the king leris (learns—the school-room), in the casteil (of Edinburgh), four pounds." The king would now be between six and seven years of age. For exercise, he seems to have been provided with a mule to ride upon; the sum of twenty shillings and sevenpence being entered as paid to "Robene Purvese for schoyne, howsis, briddil, and helteris, for the kingis mule"

His majesty goes on gradually, making a greater and a greater figure in the honest treasurer's accounts, with bolder and bolder inroads on the public purse, until the former becomes at length almost entirely and exclusively devoted to him, and the latter is wholly within his own grasp. He is still, however, in boyhood; and amongst his other amusements, we find him diverting himself with "bikkirin" mock castles with "eggis." This, it seems, was a pastime invented for him by his domestics, in which one party played the part of besiegers, and the other that of the besieged; and thus situated, they pelted away with the frail missiles just named, to the great adornment, no doubt, of the persons of the actors. The ammunition for this warfare is thus gravely entered—"Item, gevin for eggis to bikkrin the castell, fifteen shillings and sevenpence;" but it would seem that those who joined the king in this amusement either did not think the legitimate supplies of "eggis" sufficient for carrying on the war, or were willing to save the king the expense of buying them; for we find his majesty ultimately ordering payment of twenty shillings, "till puir wivis that come gretand upon his grace, for eggis takin fra thame be his seruandis."

In 1530, the king had arrived at the period of life (18 years) which entitled him to assume the reins of government. He now, therefore, makes preparation to come before the world in all the splendour becoming his elevated rank. He provides himself with the most costly clothes and arms, and flings money around him with princely munificence. In the department of wearing apparel, the shirt engrossed a share of expense and care altogether unknown in our times. This in some measure arose from the circumstance of the doublet's being worn so low cut on the breast as to expose a large portion of the shirt, and there being no neckcloth worn to assist in concealing it. The king's shirts were, therefore, richly and elaborately wrought about the collar and breast with gold and embroidery. Many entries similar to the following occur in the treasurer's account—"To David Bonar, for 13 double hankis of gold, quhilk war deleurit to David Lindesayis wife, to sew the kingis sarkis; the price of ilk hank ten shillings." The whole dress of the monarch was exceedingly picturesque and splendid. It was composed of the richest velvets, silks, and satins, and nothing could be more gallant or more elegant than his appearance. His short russet boots, his short surtout of fine cloth or velvet, richly embroidered with gold, his bare neck, and low black velvet bonnet, looped up with a diamond or ruby, and exhibiting a light and graceful feather, while massive chains of pure gold traversed his chest, suspending his hunting horn, sword, &c., must have altogether made up a figure such as no subject could look upon without an admiration independent of the homage due to a king. The half boots, however, were sometimes exchanged for shoes of velvet, the former being probably worn only when the king went abroad, and the latter, when he kept at home. The shoes are thus noticed in the treasurer's accounts—"Item, to be schone to the kingis grace, five quarteris of quhite welvot, price of the elne three pounds;" and again, for the same purpose, "five quarteris blak welvot, three pounds five shillings." The place of his velvet bonnet, too, was occasionally supplied by a brown beaver hat, an entry to this effect appearing in the accounts—"Item, to ane tanny baver hat, to the kingis grace, five shillings." His loose wrappers, or dress gowns, for wearing in the palace, were of the most magnificent description, being of various coloured satins, richly lined and embroidered: a sumptuous gown of this description is thus noted—"Item, given John Young brodistar (embroiderer), for stufe and

broidering of sixty-four pece of Crownis, James, and Thressilis, set upon twa tynnakilis of tanny veluet quhilk was ye lyning of ane gowne of claith of gold of ye kingis, price of the pece, ten shillings. Item, for six ellnis bukrem to lyne ye saidis tynnakilis with, price of the ellne, eleven shillings and eightpence. Item, for twenty-six elnis rubbennis (ribbons) to thame, price of the elne, eightpence;" and, again, for "broudering of ane vestment of tanny veluet, with fourteen James, Crownis, and Thrissilis, seven pounds." The coins alluded to in the entries were given to the embroiderer, to be converted into gold-work to be put on the gowns.

Some glimpses are also afforded us in these curious accounts of the king's domestic conveniences and luxuries. Amongst these, we find seven "fyne drinking glassis for the kingis grace, ten pounds eleven shillings;" and, "to be schaving claithis to the kingis grace, three elnis small Holande claith, price of the elne, fourteen shillings." In this particular, the king must have advanced a step farther in civilization than his father James the Fourth, who was content to have his beard clipped with scissors. The king's study, in Stirling castle, was provided with desks, covered with "sad grene," 4¾ ells of which, at thirteen and fourpence the ell, are charged in the treasurer's account for this purpose. Nor was his majesty a stranger to the cares of the toilet. Amongst the knick-knacks which go to furnish forth that important studium, we find charged for "garnising of ane buist (box) for onctmentis (ointments) to the kingis grace, siluer and fassoune (making), thirty-one shillings." A silver clam-shell, for holding the king's tooth-powder, is likewise spoken of; and also "ane pennose of siluer, to keip pyke-teith in to ye kingis grace." It seems that his majesty was in the regular practice of bathing his head, there being many entries for towels for rubbing and drying the royal head: one of these runs thus—"To be drying-curchissis to the kingis grace hed, nine quarters of Holande claith." But perhaps the most curious personal details relating to the Scottish king are to be found in his preparations for a sea voyage. It was on the occasion of his visiting the western isles (May 1540), with the view of putting down the lawlessness which then prevailed there, and of exhibiting some examples of wholesome severity amongst the wild inhabitants and ferocious chieftains of these districts.

His majesty very judiciously begins with getting "ane cote and ane pair of brekis, for the see," for the making of which there is "deluerit to Thomas Arthure ten elnis reid crammessye veluet, price of the ellne, seven pounds. Item, for five unces pasmentis of gold to it, eight pounds fifteen shillings. Item, for pointtis to the cote and brekis, and ane tulat to the cote, three shillings."

The king also took on board with him three cases of silver-work. The preparations for his accommodation in the vessel are thus enumerated:—"To the tapesar, to hing the kingis chalmer in the schip, seventeen and a half elnis Franche grene, fifteen pounds fifteen shillings. To be curtingis, and ane couer to ye kingis bed in the schip, 25¾ ellnis blak dames, forty-three pounds fifteen shillings and sevenpence. To be stremaris to the kingis schippis, nine score elnis reid and yellow sey, and till complete the samyn, fifteen ellnis serge;" and again, "to be ansenzeis (ensigns) to the schippis, 17 ellnis reid and yellow taffitese of cord, and to be croces thairof, 4½ elnes quhyte taffitese of Janis."

Great quantities of bed-clothing, and a number of pavilions, to be erected on occasion of the king and royal suite landing any where in the isles, are besides brought down to Leith from Holyrood by a cart, and put on board the ships. The king would appear to have had two different beds in the ship, and two different apartments: one has been already spoken of, and shortly after we find another alluded to, thus—"To be ane couer and curtingis to the kingis bed in the *nether chalmer* in ye schip, 17½ elnes grene dames." It is not easy to conceive what could be the reason for this apparently superabundant accommodation.

The expenditure of the king in gold and silver-work, for trinkets, ornaments, vessels, utensils, &c., was exceedingly great, and is altogether at variance with the general preconceived notions of the poverty of the Scottish kings; but probably, after all, it only shows us that it is not necessary that "he who slays fat oxen should himself be fat"—that he who reigns over a poor people should himself be poor. However this may be, his majesty's outlay in such matters was sufficiently princely, as my lord treasurer's accounts bear witness. The entries of this kind are endless, but we shall select a few of the most remarkable. "Deluerit to Johne Mosman, to mak ane croce of gold, to set diamint stanes in eight angels rubillis, six licht Franch crownis, fifteen pounds four shillings. Item, to Johne Mosman, for making the great basin of gold, weyand 10 pund wecht ane unce and ane half unce, and making of ane schip, chenzies, &c., seventy-five pounds ten shillings.* Item, given for ane chenzie, delieurit to John Mosman, to melt with uther gold to be the kingis grete chenze, one hundred and ten pounds." The crown, however, on which one would have thought a good deal of justifiable expense might have been laid out, does not appear to have been very costly, though it certainly still seems to have been rather a handsome article. It consisted of "3 pund wecht 10 unces, and thairof gold of ye mynde (the mine, ore) 12½ unce." The making and fashion cost thirty pounds. "Item, for 24 stanes thairto, of the quhilkis thair was 3 grete garnettis, and ane grete ammerot (emerald), price of the three, six pounds; and price of the pece of the uther 19 stanes, fourteen shillings."

The king's expenses in jewellery, however, were by no means always on his own account: he gave away freely and liberally, and with a munificence becoming a prince. His new year's gifts, in particular, were numerous and valuable. In the December of 1538, they amounted to two hundred and thirty-nine pounds nineteen shillings, for "chenzeis of gold, gold ryngis, tabellatis, and uther golden work, deleurit to ye kingis grace again new zeiris mess, and gieuen in new zeiris giftis." His gallantry, also, led him into rather serious expenses in this way; and if such things make any impression on fair bosoms, James must have stood well with the ladies; for we find, that, in one month, his expenses for ringis, goldin work, dyamentis, chalfferonis, and chenzies of gold, small chenzies and tabellatis, "to gif away amang the gentille wemene," amount to four hundred and eleven pounds nineteen shillings and threepence.

James was particularly curious in his arms and armour, many entries occurring regarding these warlike items, such as, "to scabbartis to ye kingis raperis, five quarteris blak veluet." "Item, to mak frenzeis to his grace swerd handis, three unces black sewing silk, fifteen shillings, and warkmanship, three shillings." And, again, "to Williame Sinebeird, for dychting of swerdis, rapperis, harnessing, steill sadillis, Jedburcht stavis, and utheris wappines to the kingis grace, twenty-three pounds five shillings." The most splendid article, however, noticed amongst the king's defensive armour, is "ane target of gold, with ane marmadyne in it of dyamentis, of ye kingis awin gold;" that is, the gold raised from his own mines, which lay in the upper parts of Lanarkshire.

If his majesty's example would have gone any length in making his subjects archers—a thing always much desired by the Scottish kings, but never attained—they would have made some progress during his reign, for he was passionately devoted to the bow, and spent much of his time in practising with that weapon. Entries for bows and arrows for the king's use occur on almost every page of the accounts; and he seems to have procured them from a great variety of quarters, purchasing them from celebrated makers, and getting choice ones sent him in presents. But some of these entries afford us another proof of the backwardness of the Scots in every thing relating to this once celebrated weapon, as they show us that the king principally employed an "Inglis bower" to furnish him with bows and arrows. The quantities which he procured of these for his own use is astonishing; and it is not very easy conceiving what he did with them all, unless we suppose that they broke with him very frequently. The feathering of three dozen arrows is on one occasion charged thirty shillings, and a bow for the "kingis grace" twenty shillings, both apparently very high prices. Canvass targets, probably not very dissimilar to those used by the Edinburgh archers of the present day, were erected at the butts at Stirling, for the king's practice.

The amusements of the king were various, for, on the whole, rude and wild as the times were, he seems to have had a merry time of it, his whole life consisting of little else than one continued round of pleasure and pastime; any interruptions which occurred were generally of very short duration; and as to public duties, he seems to have had wonderfully little to perform. In short, the kingly office was apparently a most decided sinecure, or something very closely approaching it. The most prominent and most important of the royal pastimes was hunting. The king's favourite place of resort for this amusement was Megotland, a wild district in the southern border of Peeblesshire, and adjoining to Ettrick Forest—although he occasionally went to other quarters besides; but the former, and it is often elsewhere alluded to, appears from the following entry to have been preserved for the especial sport of the monarch:—"To Williame Mure, to pass with ane lettre to be proclaimit at Selkirk, Peblis, and Mofat, that na man hunt in Megotland, Askdale Mure, Twedd Mure, unto the kingis cuming, twenty shillings." The preparations for the king's going a-hunting were generally very extensive and multifarious. He did not by any means set out simply on horseback with a few attendants to spend a day or so in the fields. The affair created a great stir in the country, and was long premeditated. Messengers were dispatched in all directions to summon the nobles and gentlemen of various parts of the kingdom to the "kingis hunting;" the royal pavilions and bed furniture were previously dispatched to the scene of action, and erected there on a convenient spot; and that these were sometimes in no small quantity, appears by the following entry:—"To Malcolme Gourlaw, delieurit for ten carage horsis tursand (conveying) the kingis palzeonis (pavilions) to the hunting, ye space of nine days, and ane horse quhilk brocht the bed forth of Striuiling, nineteen pound two shillings." Similar entries to this occur in every instance of his majesty's going out to enjoy the sports of the field, which he sometimes did during the space of eighteen or twenty consecutive days at a time. His hunting gear altogether seems to have been rich and costly, as the following entry will evince:—"To Will. Forrest, for the pair of grete dog irnis for deir doggis, ouergilt with gold, with a pair collaris of purpure veluet stuthit with gilting stuthis (studded with gilt studs), and for arow hedis furnesit be him to ye kingis grace, four pounds seven shillings." Nor were his majesty's hawks worse off. They, as became the hawks of a prince, dined off silver plate. "Item, given to John Mosman for 6¼ unces of siluer, to be ane clam schelle to kepe ye kingis grace halk mete, four pounds eighteen shillings and eleven pence;" and, again, "Ressauit frae Alexander Qutelaw ane clamme schell of siluer, weyand seven unce half, grote uecht, to mak ane new schell to keip ye kingis halk meit (with other charges), twenty shillings." Thus "with hound and hawk the *monarch* took his way," accompanied by a numerous and gallant band of nobles, knights, and gentlemen, all in high spirits and gaily caparisoned for the field; and, considering the various, rich, showy, and picturesque dresses of the times, the scene must have been altogether one of great animation and interest.

Amidst the various entries connected with the king's field sports, there occurs one which reflects much credit on his majesty, as it shows that, in the midst of his pastime, he did not overlook the claims for redress of those who happened to sustain any injury by it. The entry is as follows:—"Gieuen to Williame Lyell be ye kingis precept, for lynt, cale, and corne, distroyit be his seruandis at the hunting, five pounds."

Next to hunting, and probably archery, music seems to have formed the most prominent of the royal recreations, and the lute to have been the favourite instrument: indeed, he seems to have carried one or these about with him wherever he went, when his stay was likely to be of any duration. This is intimated by several notices similar to the following:—"For ane lute, with the caise, and ane dosane of stringis by (besides) coft in Glasgow, and send with Troilus to ye kingis grace in Inuerrera." His majesty's consumption of strings for his lute seems very great, and would intimate that he had been very persevering in his practice. In the latter end of October, we find that there has been "send to the kingis grace, with George Steill, 12 dosane luyt stringis, price of ilk dosane five shillings;" and in less than two months afterwards, there is "send with Weddail, futeman to ye kingis grace in Striueling, ane dosane luyt stringis and 12 hankis of small wyre, price thairof tuenty shillings;" and in eight days more we find other "seven dosane of luyte stringis to the kingis grace, deluerit to Maister Johne Coldoun."

Though the lute, from its more frequent occurrence in the treasurer's accounts, seems to have been the favourite musical instrument of the monarch, it does not yet appear to have been the only one on which he performed, as the following entry implies:—"Be ye kingis grace command to Richart Hume, Inglis manne, quhilk suld mak violis to the kingis grace, to be stufe for ye samin, twenty pounds." The wandering minstrels of the time also met with a favourable reception from the musical monarch: an instance occurs of his rewarding them with his own hand—"Deleurit to ye kingis grace, quhilk his hienes gaif to ane Irland clairschochar (Irish harper), ten pounds."

The occasional amusements of the king seem to have been masks, mummeries, and cards. To the latter, however, he does not seem to have been much addicted, as, during several years, there occurs only the following instance of allusion to them:—"Deleuirit to ye kingis grace in Streuiling, to play at the cartis, fourteen pounds;" and, unlike his father, he does not seem to have been at all given to betting, no single instance of such propensity occurring throughout all the extracts from the treasurer's accounts which are here under notice. He seems, however, to have relished occasional exhibitions of the "light fantastic toe," as appears by the following entry:—"To the Egyptians that dansit before the king in Halyrudhouse, ten pounds." His majesty is said himself to have danced with great grace and elegance. In the masks he took an active part, and was at the expense of clothing a great many of the maskers. His own share in these exhibitions is thus indicated:—"Item, to certain play gownis to the kingis grace to pass in maskine, 24 elnis Scottis quhite, price thairof five pounds eighteen shillings and sevenpence. Item, to be the uthir half of ye saidis gownis, 14½ elnis Scottis blak, price thairof eleven pounds sixteen shillings;" and, "Item, to Robert Spittall, for makyng of ye saidis gownis, three pounds." Thus we learn that the king's dress on this occasion consisted of black and white; but, judging from the number of yards employed of each colour, the latter seems to have prevailed. Of the shape of the gown, unfortunately we have no trace. On another occasion we find him appearing in a gown of red and yellow. "Item, deluerit to Thomas Arthure (master tailor), to be three play cotes agane uphalyday, 7½ elnis reid and 7½ elnis yellow taffitise of cord, price of the elne 18 shillings." The new year in particular was generally ushered in with plays and masks, for the divertisement of his majesty. The preparations for one occasion of this kind are thus noted:—"Item, ye last day of December deluerit to Schir Michell Dysart and his marrowis (companions), be ye kingis precept, to be thaime play coittis agane new zeir day, 15 elnis bukraim reid and zallow, price of the elne thirty pence."

* The minute and pains-taking editor, Mr Pitcairn, informs us that he learnt, by inquiring of his Majesty's goldsmith, that such a piece of plate as that spoken of in the text would now cost L.788, 13s., and it of course bore this relative value at that time, L.74, 10s. being then equal to the former sum.

The Scottish monarch then had also what yet always forms a part of a royal establishment, viz. a menagerie, or place appropriated for keeping strange birds, beasts, &c. The apartment devoted to this purpose in Stirling castle is yet pointed out; and that there was a similar appropriation at Falkland, appears from the following entry:—"To Thomas Melvillis wiffe in Falkland, at the kingis command, for keping of certane pettis (pets), and nurising of ye samyn, 7 elnis fyne Franche blak, to be hir ane gowne, and ane kirtyll, price of ye elne thirty-three shillings."

Besides the usual accompaniment of the Scottish court, the fool or jester, of whom there are many notices in these accounts, James also entertained several dwarfs, whom he clothed, fed, and paid. With unintentional humour, one of them is called, *par excellence* we suppose, the "Droich." There are many entries for payments and liveries to this little gentleman; but he does not appear to have been in good credit with the court tailor, if we may be permitted such a conclusion from the following entry:—"To the Droich, be my lord thesauraris command, to *lowse* his claithis fra the tailzeuris, twenty shillings."

The entries for the court buffoons are numerous:—"Item, to a fule callit Gille-Mowband, at ye kingis command, twenty shillings;" and to "Malcolme the fule, be ane precept of the kingis, three elnis russate, price thirty-seven shillings." The dresses of both the fools and dwarfs were showy and fantastic.

If additional evidence to that of which we were before in possession, were wanting to establish James's reputation for devotion to the fair sex, that evidence would be found in great abundance in these accounts of my lord treasurer. Thus, while he was as yet little more than nineteen years of age, we find ten pounds given "to ye gentile womane yat fostirrit ye kingis sone." The next is certainly of a more equivocal character, but still in the last degree suspicious. "Item, to Williame Udwart, be ye kingis precept be Dauid Bonar, for claise tane fra him (bought) be ye kingis command, to ane gentill woman." The next entry is quite positive. "Item, to ane goune to the kingis grace dochter, 3 elnis veluet, price thairof ye elne, three shillings;" then follow, "kirtills of satin, sarkis, and heid claithis," of Hollande cloth, &c. &c. Again, "to —— Mackeaw, nurris, be ye kingis gracis command, to hir reward for fostering of ye kingis gracis dochter;" again, "to be ane schort coit to Lord James (afterwards Earl of Murray, and regent of the kingdom), 6 quarteris blak satyne, price of ye elne, thirty shillings." Once more, to "ye L. L., be ye kingis command, one hundred pounds." This L. L. is supposed to have been either the Lady Lochleven or Lady Lennox, both of whom were mistresses to the king—a circumstance which was not then considered, in the slightest degree, either dishonourable or unbecoming.

Amidst all the noisy merriment, however, and profligacy which prevailed at this primitive northern court, literary men seem to have found there a ready and liberal patronage, many traces of the king's bounty to that class occurring throughout the treasurer's accounts, and amongst these the following:—"To Maister Johnne Belentine, be ye kingis precept, for translating of the Cronykill, thirty pounds." "To Maister John Belentine, in part of payment of ye translatioune of ye secund buke of Titus Leuius, eight pounds."* The books themselves, at least the "Mating Buke," seems to have engrossed a good deal of his majesty's care and attention in their adornment, as appears from the following series of entries:—"Item, of 6 quarteris of grene veluet, to be ane cover to ane grete Mating Buke of ye kingis grace, clespit with gold, quhilk he gat fra my lord secretaire, and to be ane polk (bag) till keip ye samin in, price of ye elne, three pounds. Item, for three quarteris of reid dammese to lyne ye said polk, and ye breddis (boards) of ye buke, price thairof, twenty-seven shillings. Item, for twa dowbill hankis of sewing gold, to be knoppis to ye said polk, and bordour ye mouthe of it, price of the hank, 20s. Item, to Helene Ross, for making of ye knoppis and stringis to ye said polk, and making of ye polk and covering thairto, ten shillings." The queen's "Mating Buke" was equally splendid, the entries regarding it being similarly prolix.

Every page of these curious accounts gives testimony to the liberality and generosity of the Scottish monarch. He was, indeed, a munificent prince, and scattered his bounties around him with a truly kingly hand. "Penniless lasses wi' lang pedigrees," and sometimes without any pedigree at all, are often *tochered* by the generous monarch. Thus, "be ye kingis precept to Johne, pipar of Sanct Johnestoune, in toquher with Catherine Sinclair;" and, again, "gevin to the Lord Fleming at the kingis command, in manner of tocher to his sistir." The royal bounty did not stop with the money bestowed; purses of "crammesy satin," or other material, were always given besides to put it in.

The officers that constituted the royal household are much too numerous to be recapitulated: a few of them, however, we may enumerate. There were the usher of the inner chalmer dur, yeman of the wyne sellar, squyar of the kingis stabile, ushers of the outer chalmer dur, yeman of the wardrop, yeman of the gretc lairdner, ditto of the petty lairdner, sumpturman, uscher of the hall dur, maister baxter, courte maister cuke, grome in the spicehouse, ditto in the wyne sellar, ditto in the ail sellar, grome for the silver veschell, gromes in the wardrop, under gromes in the kingis kicheing.

* Baleantyne, or Bellenden, dean of Ross, was employed to translate Boece's Chronicle of Scotland, and also the History of Livy, for the use of the king, who had not been over attentive to his Latin. A new edition of these works appeared, in three volumes, about twelve years ago, under the superintendence of Mr Thomas Maitland, advocate; published by Messrs Tait, Edinburgh.

LETTER FROM CANADA.

(Concluded.)

In our patent deeds, government retains the precious metals, and the white pine and oak; but the two latter they do not prohibit us from cutting, and, if they cut them, they pay us for them at the customary rates. Our taxes are small, being, I think, 3d. for a cow, 4d. for an ox, 1d. for a cleared acre, and 1s. 6d. per 100 acres of the land you hold. In clearing land here, and getting on with operations, they have chopping bees, logging bees, and raising bees, &c. A man generally chops his own timber, that is, cuts it down into such lengths as a yoke of oxen can pull, and what from four to five men can pile up—(all underbrush and small timber, such as he and his family can manage, they pile up and burn); and when this is done, he fixes upon a day, and acquaints his neighbours around him, according to the extent of the land he has to log, five men being necessary to a yoke of oxen, and these are able to do about an acre a-day; so that, if he has four or five to log, he requires as many yokes of cattle and men accordingly, and on these occasions they are usually very punctual in attendance. He entertains them well at these times, having killed a sheep, or a cow, or ox, or perhaps pork or venison, with always tea and grog. At a raising, again, they muster in the same manner, about a dozen of men being necessary to put up a house, with a yoke or two of oxen to drive in the timber, after it is cut and ready. The person we resided with, and one of his sons, assisted me in cutting the timber for my house, which occupied us for about a week; and when this was done, I acquainted my nearest neighbours of the day I had fixed on to get it put up, the whole of whom attended, to the number of thirteen, and put it up the same day. A log-house makes a very comfortable dwelling, being even warmer than a stone house, when properly finished. Mine is built of white pine, and covered with barwood and ash scoops, and is 30 feet by 18 over the walls. The trees selected for a house are generally about a foot in diameter, and as the trees, from their growing thickly together, are straight, and without branches to within a short way of their top, you can get a cut of 30 feet off such a tree of nearly the same diameter at both ends, and these they very neatly dovetail at the corners, which makes a very strong building, and lasts a great many years. A number of the newly erected houses are covered with shingles, that is, the wood of the white pine cut exactly like the slates with you, and look as well, and are very durable. For this sort of assistance on the part of your neighbours, you just pay them back in the same way, by assisting them when they call upon you. I have been at several of these bees, and a great deal of work is generally got through with. At the loggings, I was much struck with the docility and great usefulness of the oxen, which are generally yoked in pairs, and will scramble through among logs with a very heavy draught, with the greatest ease and patience, where you could scarce believe they could escape without broken legs, and where horses would be useless, and are equally, if not more, obedient to the call of their driver than the horse. They are equally useful in the sleigh, the plough, and the harrow. In the lower province they yoke them by the horns, but here they place the yoke over the back part of the neck and front of the shoulder. A yoke of good oxen, six years old, when they become fit for all work, cost about L.20. By the bye, the horses of this country astonished me. I saw some at Montreal equal to any I have ever seen in my life; even the carters about the wharfs drive horses that your gentlemen would be proud to see in their carriages.

The Grand River at this season is a most interesting scene. It is while the river is frozen that the principal part of the traffic between the different parts of the country takes place, and sleighs are seen moving in all directions on the ice; those drawn by horses always at a trot, and frequently at a gallop, even with a load; one of the horses having a string of small bells round his neck to announce their approach. This is the season, too, when our land roads are best, and land travelling is now also excellent. The climate of this country is not so terrific as is frequently supposed with you; we have, no doubt, very keen frost, perhaps keener than with you, and it is more constant and continued; but we have also fine thaws, when the weather is mild and pleasant; and even during our keenest frosts, we have through the day generally fine clear sunshine, the sun being much more powerful at this season here than with you; and our day is about two hours longer in winter, and two hours shorter in summer, than yours; and it is principally in the night that the severity of the frost is felt. This is generally our severest month, and some of the folks here say, that, during seven years, they have not seen such severe frost as we have had some days lately; yet, on these days, I went about what I had to do out of doors as usual, and have never put on any additional dress to what I wore at home, except deer-skin gloves, with woollen ones under them, for my hands, with mocassins, and a couple of pairs of stockings, for my feet. But you will, no doubt, think it a dreadful thing to live in this thinly-peopled country, and so far from neighbours! I thought so, too, before I experienced it, but now, I assure you, I find myself more at ease than ever I felt in a town, and we are scarce ever a day without seeing some of our neighbours, or without invitations to go to see some of them; but these we seldom accept, having always so much to do at home; and we are always welcome guests at the chief's (he is always called the Chief, or M'Nab—to call him Mr M'Nab would be thought highly derogatory), and I am never down that way but I am invited to dine with him. Indeed, there is a spirit of hospitality here which is quite unknown at home, and in travelling through the country there is scarce a house you enter where you are not invited to partake of their bed and board, without money and without price. We have just now invitations from two of the settlers that I formerly alluded to, who are storekeepers, one of whom is also an extensive lumber-merchant, and who at first worked as a lumberer himself—from the one, to a ball he is to give in a few days; and from the other, to take a drive in his sleigh on the river, and to visit some of the settlers on the opposite shore.

The wild animals of this part of the country are the bear, the wolf, the fox, the marten, the minx, the skink, the musk-rat, the porcupine, and squirrel. The first of these seldom or never acts but on the defensive; the wolves are seldom seen, but sometimes heard at night, and rarely molest any of our domestic animals, as the woods are swarming with deer, upon which they principally prey. The lesser animals I have named now and then carry off the poultry; but the most of the settlers allow them to roost in the open places, and breed in the fields, and they are of course quite exposed to attack. The chief told me that, in one season, he had seventy turkeys carried off, and he at length discovered that the culprit was a huge old wolf, that sheltered himself a little way from his house. He watched him one night, and put two balls through him. He pointed out to me where these were lodged in the wall of his house after passing through the body of the animal, and even after this it took several dogs to kill him. Deer are so numerous that you seldom pass through the woods without seeing them, except at this time of the year, when the cold forces them into the swamps for shelter. Some of the settlers have killed from twenty to thirty of these animals this season. Their flesh is, I am told, much superior to that of the deer in Scotland. I never tasted venison at home, but here I think I never tasted any thing finer, being as fat and juicy as veal or mutton. We have hares, which at this season become white, but only about half the size of yours; one of these I shot a few days ago, which weighed about 4 lbs., and made excellent soup. We have also partridges, nearly approaching in size to your pheasants, of which a great many are killed. When you come upon them, they generally take to the nearest tree, and are easily shot. We can pass through the woods here at all times with perfect safety; and the settlers think no more of passing from one part of the township to another in the night than they do in the day; and boys of six or seven will go in search of their cows for a good many miles round their clearance, where they are acquainted, without the least danger; the greatest hazard is in going into a part of the wood where one is not well acquainted, especially if the sun is not seen, for then you are just as apt to go in the wrong as in the right direction.

The whole surface of the land here is covered with wood, except the meadows formed by the beavers. These are, in extent, from a few acres up to 50 or more, and are spread here and there throughout the whole township, and furnish the settlers with excellent winter feeding for their stock. Some of these meadows are as lovely spots as I ever saw, their margins being generally fringed with the beautiful dark green foliage of the evergreen, balm of gilead, and spruce fir, whose tops tower above the surrounding wood. The beavers are now entirely extirpated, the Indians considering them as their peculiar property, and always destroy the whole of them so soon as a township is surveyed. These meadows are every year losing their beauty, as the dams and canals of the beavers are being choked up with alder willows and other plants; but many of the stumps of the trees, cut down by these wonderful creatures to form their dams and embankments, are still to be seen; and it is worthy of remark, that in chopping down a tree we exactly follow their mode of doing it.

I subjoin a rough draught of the township, from which you will be able to form a pretty correct idea of our situation. I have not put into it a river called the Lochy, and have laid down only so much of the Dochart as shows how it affects me. This stream is something like the Westburn, or perhaps a little larger, and at some after time may be turned to account as a mill power. Between each concession there is a road of 66 feet in breadth, and the same between every fifth lot. These roads are not yet cut, but each settler is bound to clear the half opposite his own lot. The township is laid down in 200 acre lots, and contains nearly 80,000 acres.

The sowing season commences about the middle of May; and those settlers who have not oxen of their own, and cannot obtain the use of them, just hoe and rake in their seeds in a very tedious and insufficient

manner. Seeds are continued to be put in till the end of June and beginning of July, potatoes being the last, and by this time the full crops of wheat and rye are becoming ready for the sickle. On our best land we will sometimes have a return of 30 bushels of wheat for each bushel sown, but generally not more than 20. Farm-servants get from L.24 to L.30 a-year, and their board. Women get L.12. Sheep are a very profitable stock, and thrive well. Wool sells readily at 2s. 6d. per stone. My land, from its lying high and dry, is well adapted for this sort of stock; and I may have, in two or three years, 40 to 50 acres in grass, besides 20 or 30 for other crops, having at least this much land upon which there is not a living tree; and although, in many parts of this land, dead stumps and withered trees are standing, these would be no impediment to harrowing in the timothy and white clover, which would cut for hay, or be made pasture, as might be thought expedient; but if I am not able to overtake this, the land will of course again become every year wilder.

This is a very healthy part of Canada, sickness of any kind being very rare; and fever and ague, which are very common over about the great lakes, are here quite unknown. But we have neither church nor school in this township; many of the young people are growing up without even learning to read; and, in return for the attention and kindness which have been shown to us by our neighbours, I have undertaken to give their children lessons in reading and writing, during an hour of the day, along with my own. I have about a dozen sometimes in attendance; and although some of them have nearly two miles to walk, they are seldom a day absent.

We have very few mechanics here: indeed, I know of none, except two smiths, who have also land; one shoemaker, and a tailor employed by the storekeepers, who receives twelve dollars a-month, and board, but this man is generally half the week drunk. In my opinion, no man can do wrong in coming to this country who is industrious and sober, and who is not amply remunerated for his labour at home; for it is beyond all doubt that the Canadas have as great natural advantages as the United States, and are running the same race in prosperity, and to greatness.

I am, &c. &c.

TREATMENT OF SPRAINS.

No accident occurs perhaps more frequently than that of sprain, wherefore we have thought some information concerning the nature of this accident, and the manner in which it should be treated, will not be unacceptable to our readers. We find in Mr Liston's Elements of Surgery the following observations:—"Sprain is generally occasioned by a fall, the foot or hand coming awkwardly to the ground, the muscles being at the same time relaxed and unprepared; by over-exertion in lifting heavy weights; by entanglement and twisting of the limb, &c. The ankle is often sprained by what is called 'a false step;' the fore part of the foot comes into contact with an obstacle unexpectedly; the foot is twisted under the limb; the weight of the body is thrown on the apparatus of one side of the joint, and this is in consequence immoderately and unnaturally stretched." Such is one of the most frequent ways in which this accident occurs. Then follows violent pain, and the patient feels sick and faint: the part injured becomes discoloured, and a rapid swelling takes place, owing to the escape of blood from the torn vessels. Afterwards, from the excited action of the vessels, the fluid which lubricates the joint is increased in quantity, and the joint permanently deformed. "Attentive examination (says this surgeon) is required to guard against mistakes, the existence or non existence either of displacement or of fracture, must be at once ascertained by determined and perfect manipulation; the parts must be pressed and moved to such an extent as is necessary, notwithstanding the pain thereby occasioned, and notwithstanding the resistance afforded by the patient." This caution is necessary, because one or more of the small bones of the wrist are often displaced; and fracture of the fore arm, and even separation of one bone of the fore arm from the other, are accidents of by no means rare occurrence. "Perhaps," says Mr Liston, "no injury is more frequently mismanaged by those both out and in the profession. Every old woman thinks she can manage a sprain; most absurd and hurtful measures are resorted to; cold lotions and cold effusions are employed, and at the same time stimulating frictions; probably attempts are made, either by leeching or by puncturing, to extract the effused blood; and many similar follies are committed. The proper treatment appears certainly to consist in absolute rest. If there is any displacement, it must be rectified immediately. If there is any fracture, or if there is a tendency to redisplacement after reduction, or if the patient is restless either from folly or insensibility, * * * * a splint or splints must be applied, to secure the immobility of the part, at the same time without such compression as may interfere with swelling from effusion (or escape of the watery part of the blood underneath the skin), which is a salutary process, and ought to be encouraged. By absolute rest, the extent of the swelling is limited, and inflammation warded off. Fomentations properly employed afford much relief. * * * The integuments soon become relaxed during the regular use of fomentation. * * * The swelling then abates, and is no longer hard; it pits on pressure, and the skin has a puckered appearance. Then gentle friction becomes advantageous, and uniform support should be afforded by the application of a flannel roller. The longer the limb is disused, the more perfect and rapid is the recovery, provided the rest of the cure is properly conducted. In general, nothing more than what has been stated is required. But if the limb be moved in any way early, then necessity will arise perhaps for bleeding; certainly copious and repeated abstraction of blood by leeches, accompanied with fomentations, and the internal exhibition of antimonials, purgatives, &c. When such is the case, the cure is tedious; the joint long remains swelled and stiff; the patient is lame, and incapable of exertion. Leeching or puncturing at an early period, with the view of allowing extravasated blood to escape, is useless and hurtful. * * * Friction, with stimulating liniments, or even simple friction at an early period, is also hurtful, tending to excite the action of the vessels, and to convert simple swelling into inflammatory. The application of cold at any period is of little use, and ought certainly to be avoided immediately after the injury, as adding to the sufferings of the patient, and interfering with the natural processes that have commenced for the reparation of that injury. In limbs that have remained stiff after severe and mismanaged sprain, the dashing of water, either cold or tepid, has been strongly recommended: the practice is not ineffectual; the vessels of the surface are excited, perhaps, as by other friction, and perhaps by the reaction which follows the chill. But the limb is apt to become rheumatic, and, on this account, the state of matters will not be improved by this proceeding, unless it be resorted to with proper precautions." Such are the recommendations of this skilful surgeon for the general management of sprains, which are often very troublesome, and require the treatment of a judicious medical practitioner.

ODDS AND ENDS.

EFFECTS OF KINDNESS TO THE SICK.

"Under all circumstances," says Dr Armstrong, "man is a poor and pitiable being, when stricken down by disease. Sickened and subdued, his very lineaments have a voice which calls for commiseration and assistance. Celsus says, that, knowing two physicians equally intelligent, he should prefer the one who was his friend, for the obvious reason that he would feel a deeper interest in his welfare. Kindness composes, and harshness disturbs the mind, and each produces correspondent effects upon the body. A tone, a look, may save or destroy life in extremely delicate cases. Whatever may be the prognosis given to friends, in all cases of fever the most confident and consoling language about the ultimate recovery should be used to the sick, as prophecies not unfrequently contribute to bring about the event foretold, by making people feel or think, or act differently from what they otherwise would have done. Again, in chronic cases, as time is required for their cure, by explaining to the patient this fact, we maintain his confidence, we keep his mind easy, and thus gain a fair opportunity for the operation of regimen or remedies; in short, the judicious physician, like the Roman general Fabius, conquers through delay, by cutting off the supplies, and wearing out the strength of the enemy. In large cities, where the mind is so much over-wrought in the various schemes of private ambition, or of public business, anxiety is very frequently the grand opposing circumstance to recovery; so that, while the causes which produced it are allowed to operate, mere medical prescription is of no avail. The effects of this anxiety are visible in the pallid face or wasted body. But if the patient be possessed of philosophy enough to forego his harassing pursuits; if he has not, from the contact and cares of the world, lost his relish for the simple and sublime scenes of nature, a removal into the country is of the utmost efficacy. The deformity and conflict of the moral world are exchanged for the beauty and calm of the physical world; and, surrounded by all the poetry of earth and heaven, the mind regains its peace, and the health, as if by magic, is perfectly restored."

THE GUELPHS AND GHIBELLINES.

It was about the middle of the twelfth century that these two names resounded as a war-cry at the battle of Reinsberg, in Germany. Henry Welfe Este united to the duchy of Tuscany, and to the other possessions of the house of Este, in Lombardy, the duchies of Saxony and Bavaria. He entered into intrigues to obtain the imperial crown; but Conrad Duke of Franconia, his competitor, was preferred to him. Henry Welfe Este refused to acknowledge his authority, and was despoiled of his German possessions. After his death, which happened in 1120, his brother, Welfe the Sixth, made war upon Conrad, to recover his rights in Bavaria. The imperialists were commanded by Frederick, the emperor's nephew, who had been educated at *Wuiblingen:* their war-cry was *Wuiblingen*—that of the Bavarians was *Welfe.* The use of these words passed from Germany into Italy; and being metamorphosed into Ghibellines and Guelphs, designated, up to the fifteenth century—the former, that party which upheld the emperor's pretensions—the latter, the party which opposed them.

The royal family of England is sprung from the former of these renowned houses.

PRINTER'S DEVIL.

This is an appellation which most of our readers must have frequently heard; but as many of them may not be aware of its origin, we copy the following explanation from Mr M'Creery's Poems of the Press, &c.:—

"In the adventure of Dr Faustus and the Sorbonne at Paris, we seem to have the origin of the opinion that the printers have occasion for the assistance of a supernatural personage in the progress of their labours, with whom all the rest of the world is most anxious to avoid any very intimate acquaintance. Had we no other complaints against his Satanic majesty than that of assisting John Faust to bring to perfection the art of printing, we certainly should have no right to stigmatise him as being of so malignant a disposition as he is commonly represented. The printer's devil is a character almost identified with the origin of the art, and we may consider ourselves peculiarly fortunate in having a guardian exclusively assigned to us, from whom, notwithstanding his general bad conduct to other people, we have so little to apprehend, and who is commonly our faithful assistant, both in our labours and our pleasures. From hence also the legend of the *Devil and Doctor Faustus.* In further elucidation, we may inform our readers that the youngest apprentice of a printer is called the devil, and he generally runs all the messages, and conveys the proofs of works in the press, between the printer and the author."

THE SPEECH OF ANIMALS.

Sibscota observes, that although articulate speech is peculiar to man, it is often imitated by different animals, but not accompanied by that reason or intellect which regulates it in the human race. Thus the speech in parrots, crows, and other birds that are taught by art, is nothing else but a certain articulate voice, without any mental understanding, to which they are trained up by custom, not knowing what is signified by the words; so that the parrot which rehearsed the Apostles' creed did not understand the things signified by those words; and, therefore, this sort of speech is not a representation of reason, and, consequently, not true speech. But it sometimes happens that they seem to appropriate the names of things to the things themselves, or retain the signification of them; that is the work of memory, by which they accommodate those words, which they, by their docility, have gained to particular things, as they have been accustomed to them, and according to their often-repeated appellations. And as the parrot which fell into the river called for help, and promised a reward, it must necessarily be that she had by practice learned these words, being oftentimes before in the like danger. And since it is undeniable that not only elephants, but some other creatures, do in some manner understand the speech of man to which they are accustomed, and know what is meant by such and such words as they are taught (and as they, by the motion or gesture of their masters, know what they would have), though some more exactly than others, is it a greater wonder for these brutes, if they have organs fit for speech, to be able, by outward expressions, as they have learned by custom, to signify the single conceptions of their estimative faculty to others which they frame within themselves, according to the common speech which they are accustomed to, than that they should, by the usual gestures of the body, and other various ways (which is also the speech of mutes), be able to adumbrate their inward conceptions to others? Or what wonder is it for a parrot, magpie, crow, starling, to express what they inwardly feel or desire by an articulate voice, or such as they have learned by custom? And those creatures that have been used to speak, can count numbers, and yet they have no formal conception of those numbers.—*Curtis on the Deaf and Dumb.*

TO OUR READERS.

Every article in this paper, not marked with a quotation at the end, or otherwise, is original, and written with an express reference to the character and objects of Chambers's Journal. In the present number, overlooking the anecdotes on the last page, the tale entitled "Legend of Marseilles," is the only article not *original; that is to say, for two columns of selected matter, there are upwards of twenty perfectly new. Notices to this effect will be repeated from time to time, to obviate the injustice done to us by various illiberal newspapers, which have falsely asserted that the greater part of our matter is borrowed—a tale the more readily believed on account of the low price of the Journal. The fact is, that, while those very newspapers exist upon matter which may be said to be common to them all, our own little sheet contains, in every one of its numbers, a mass of literary composition quite independent of all its contemporaries, and which requires, for its preparation, an association of writers much more numerous than what is concerned in almost any political journal in the empire.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER." AND "INFORMATION FOR THE PEOPLE."

No. 74. SATURDAY, JUNE 29, 1833. PRICE THREE HALFPENCE.

THE TWO BROTHERS.

Of the divided affections too often observable among brothers, a most remarkable instance happened a few years ago in the family of a gentleman of the north of Scotland. George and William Stirling were the only sons of the gentleman alluded to, and they had grown to manhood in the exercise of that mutual kindness which it is so delightful to observe in relations of that degree of consanguinity. I am not aware that there was any thing remarkable in their characters: they were, simply, two respectable young men, of good education; and while the elder was reared to the enjoyment of a competent fortune, the younger soon attained such a degree of distinction at the bar, as rendered his fate little less enviable. On the death of their mother, which took place when they were between twenty and thirty years of age, some dispute arose respecting a legacy, the destination of which had not been expressed in terms sufficiently clear, and which, after a brief suit at law, was determined in favour of the elder brother. At first, it was resolved by the two brothers that this plea should be amicably conducted, merely for the purpose of deciding an uncertain matter; but some circumstances unexpectedly occurred, which acting upon the inflammable nature of the elder, and not being met with a proper spirit by the younger brother, speedily produced a decided alienation between them. Each retired sullenly into the fortress of his own pride; nor were their father's entreaties and good offices, or their common recollection of twenty affectionate and happy years, of the least avail in bringing them once more together. They did not again meet for ten years: it was at their father's funeral. The old gentleman had died in presence of his eldest son only, reiterating with his latest breath those injunctions, so often before employed in vain, that his two sons might be restored to brotherly friendship; an object, he said, which engrossed his thoughts so much in life, that he felt as if he could not rest at peace in his grave unless it were accomplished. The two brothers met, but without taking the least notice of each other, when respectively mounting their carriages, in order to follow the corpse of their parent to the family burying-place in Aberdeen. Their hearts were still filled with fierce and indignant feelings towards each other, though it is not improbable that the elder had been somewhat touched, almost imperceptibly to himself, by the dying entreaties of his father. The procession, consisting of a hearse and the carriages of the two brothers, set out on its long and dreary journey, which was rendered additionally melancholy by the gloom of a December day. It was originally designed that there should be no stoppage, except to exchange horses, till they reached their destination; but this arrangement was destined to be strangely disconcerted. A fall of snow, which had begun only that morning in the low country, was found, when they reached the hilly region, to have been of two days' continuance; and it was with the greatest difficulty that they reached a lonely inn, about half way towards the capital, beyond which it was declared by the postilions there was no possibility of proceeding that day. This humble place of entertainment was accustomed to lodge only such guests as carriers, and as it was partly occupied on the present occasion by various wayfarers, the host, with all anxiety to accommodate such distinguished guests as those who had just arrived, found he could not by any means offer them more than two rooms. It was his expectation, that, while one of these was devoted, as decency required, to the reception of the corpse, the other would serve for the two mourners, and he accordingly proposed to make up an additional bed in the room which he had marked as that which should receive his living guests. What was his astonishment, and what was the astonishment of all the inmates of the house, when he was informed by a servant that one of the gentlemen would sleep in one of these rooms, while the other had no objection to that in which he had placed the corpse! It was not, however, for him to make any resistance to such an arrangement, and he accordingly caused the rooms to be prepared as befitted the taste of his guests.

It must communicate a strange feeling to know that two brothers—men of cultivated understanding, and each respected in his sphere for public and private worth—actually carried this dreadful arrangement into effect, in order to avoid what they must have contemplated as a more painful thing—the spending of a single night in each other's company. It was the younger who proposed, as a solution of the dilemma in which he found they were placed, to take up his quarters in the same chamber with the corpse: unpardonable as the elder was for his share of the dissension, it is but justice to him to state, that he could not, after the dying request of his father, have encountered the sensations which might be expected to arise in so dreadful a situation. During the evening, as the storm prevented them from going out of doors, each kept his own room, and was severally served with the refreshments which he required. Night came, and each went to rest. Morning returned, and still the storm was unabated. It was therefore necessary to spend another day in the same extraordinary circumstances. Slowly, slowly waned the hours of the twilight day; and still the snow continued to fall in its broad and lazy flakes, seeming, to the two brothers, as each surveyed it listlessly from his window, the very personification of monotony. As the rooms were close to each other, and only divided by a thin partition, through which there was a door of communication, each of the unhappy gentlemen could overhear every thing that his neighbour did, almost to his very breathing. It at length became the amusement of each, unknown to his fellow, to watch the proceedings of the other—to note every footfall, to register every sigh. George, in particular, became interested, in spite of himself, in the situation of his brother, which, in consideration of what he had heard from the lips of his dying father, bore to him an aspect more repulsive and painful than it perhaps did to the actual sufferer. At length, when, after a weary day, the time of rest again drew nigh, and the house became more than usually still, he heard a groan—a groan partly suppressed, but still bearing distinctly the impress of unutterable anguish—proceed from his brother's room. He listened more intently, and in a few minutes he could make out that the living tenant of the death-chamber was prostrated beside the coffin—weeping—bitterly weeping—but still making every effort to bury the expression of his grief in his own bosom. It may easily be imagined that such sounds, coming upon a heart which had been insensibly undergoing a softening process during the whole day, must have had the best effect. Still the rancour of ten years was not to be got over by tears shed under such circumstances. He softly stole, however, to the door, and watched with the most intense anxiety every respiration and movement of his afflicted brother. After waiting a few minutes, he distinctly heard William breathe forth the words, "Oh, mother!" and that in a tone which referred so pointedly to the source of their unhappy quarrel, that he could no longer entertain a doubt as to the nature of his brother's present reflections. A thousand tender associations were awakened by that endeared word: he reverted to the early days when they had no contention but for her affections, no rivalry but for the kind bounty which she was always ready to bestow upon each alike. Human nature could hold out no longer, and he gently tapped at the door which had hitherto kept them apart. "William," he said, "may I come in?" The voice of affection could not be mistaken. William opened the door in an instant, and, as if he had guessed intuitively the disposition of his brother, rushed into his arms.

The next day saw the two brothers amicably proceeding in one vehicle to the family burial-place, where, in the grave of their father, they inhumed every bitter feeling they had ever entertained against each other; and at present, taught by the sufferings which they endured in their period of alienation, there is no pair of friends who take such pains to cherish each other's affections, or to avoid all means of converting them into gall.

NATURAL HISTORY.

THE STOAT.

THERE is little difference in the shape of the stoat from that of the weasel, and they have consequently been frequently confounded.

The length of the stoat is about ten inches, exclusive of the tail, which is five inches and a half; it is very hairy, tipped with black; the edges of the ears, and ends of the toes, are yellowish-white; in other respects, it resembles the weasel both in colour and form. In the northern parts of Europe, during winter, the fur changes to a pure white, except the tip of the tail which retains its blackness through all seasons, and in every climate. In winter, it is called the *ermine*; and in this condition is much sought for, on account of the high value placed upon its fur, which has been that worn by royalty from very remote times.

The stoat abounds in Norway, Lapland, Russia, and other northern climates, and forms a valuable article of commerce in these states. It is found even so far north as Kamschatka and Siberia, where the hunters take it with traps, baited with flesh.

In Norway, it is their practice either to shoot the stoats with blunt arrows, or they are taken by traps, made by two flat stones, one being propped up with a stick, to which is attached a baited string; and as soon as the animal begins to nibble, the stone falls down, and crushes it to death. In Britain, they also sometimes change to white in winter; but their skin is of little value, compared to those in northern Europe, having neither the closeness nor whiteness of fur. The skins are sold, in the districts where they are caught, at from two to three pounds sterling the hundred.

A singular circumstance was observed by a friend of the present vicar of Liskeard, in Cornwall, in August 1829. A stoat was in hot pursuit of a water rat, which latter took the water, where he doubtless expected to be safe from his enemy; the stoat, however, took the water, and followed his prey across the narrow pond, but lost it at last from the rat getting into a hole.

The following incident was narrated by a gentleman, as having come under his own observation:—"A slight snow covered the ground," says the narrator; "and he, having walked out to an adjoining hill to meet with one of his shepherds, fell in with the track of one of these stoats, which is easily to be distinguished from that of the smaller species by the larger foot-print, and length of the spring, among the snow. He followed the track for some time for his amusement, along the side of the hill, until he came to the marks

where a pair of grouse had been sitting, when he lost all traces of the stoat, and could follow it no farther. As there was no appearance of a hole, he was much surprised; and paying close attention to the track of the animal, he came to be convinced that it had sprung upon one of the birds, which had flown away with it. As he is a person of uncommonly acute observation, sound judgment, and strong sense, I have the utmost confidence in the correctness of his mode of accounting for this singular circumstance. The conclusion is, that the stoat knew quite well what it was about, and would keep its hold until it came to the ground again. The matchless agility and comparative strength of this bold little creature would enable it to save itself during the fall; before which took place, it had probably destroyed the life of its harmless prey."

The following well-authenticated instance surpasses any idea which we could have formed of the extensive depredations of these animals:—About the middle of July 1827, a gentleman at Cathcart shot at and wounded a stoat. The animal escaped into a hole in an old stone wall. He was induced to explore the place of its retreat, when the first victims he met with were a couple of leverets immutilated; a little farther on two young partridges, also entire, and a pheasant's egg unbroken. Beyond these were found the heads of two other leverets, in a state of putrifaction; and at the extremity of the hole, lay the little mischievous marauder himself, dead. We would have thought this extraordinary accumulation of plunder was the consequence of a provident disposition in the animal, but, from the appearance of the leveret's head, &c., it seems to bear out what has been so often stated by naturalists of this tribe of animals, that they seldom devour any of their prey till it begins to putrify.

THE FERRET.

The ferret is somewhat smaller than the polecat, to which it bears a close resemblance; the fur is yellowish, and the eyes are red. The ferret is a native of Africa, and is only known to us in a domesticated state. It was first introduced from thence to Spain, and was used to reduce the number of rabbits which abounded in that continent. It has subsequently been employed for the same purpose in Britain, as well as in other European states. Its constitution, however, has never been completely brought to bear the cold of a northern climate, and requires much warmth and attention to preserve it alive. The ordinary method of keeping the ferret is in a box amongst wool, of which it forms for itself a comfortable bed. It is a nocturnal animal, and generally sleeps during the day, and feeds at night. In a domesticated condition, ferrets are usually fed on bread and milk, flesh being considered improper for the indolent lives they are taught to lead.

In a domesticated state, the ferret breeds twice a-year. The female goes with young six weeks, and brings forth from five to eight at a birth.

Warreners sometimes cross the breed with the polecat, the produce of which, in some instances, prove superior, in point of ferocity, to the ferret. The ferret has such an instinctive antipathy to the rabbit, that, it is said, if a dead one be presented to a young ferret which has never seen one before, it seizes upon it, and maintains its hold with great pertinacity, and will not quit its hold, but continues to suck the blood till completely satiated. While using the ferret to drive rabbits from their burrows, they must be muzzled, otherwise they would fix on them, gorge themselves with their blood, and then fall asleep. Instances have been known of their disengaging themselves of their muzzles; in which case they remained in the holes, and could not be recovered but by digging for them, or, if too deep, smoking them out. Both these methods have been resorted to without effect, and the ferret has kept his retreat good for the summer, and lived by preying on the rabbits; but when winter sets in, they either perish from cold, or leave the hole, and are then easily retaken.

The ferret is also a great enemy to rats, and will not suffer one to remain alive where it is allowed to go in search of them. Although easily tamed, they seldom evince any attachment, and are of a very irascible disposition. They emit a very fetid odour, like the whole of their congeners.

The following is a remarkable instance of ferocity in the ferret:—"A man of the name of Iles, a bargeman, finding himself much incommoded by the repeated mischief done in his barge by rats, procured a ferret to destroy them. The ferret remaining away a considerable time, he thought it was devouring some rats that it had killed, and he went to sleep, but was awakened early next morning by the ferret, who was commencing a regular attack upon him. The animal had seized him near his eyebrow, and after endeavouring in vain to shake him off, he at length severed the body from the head with a knife, the head still sticking so fast as to be with difficulty removed."

THE SABLE.

The sable is about eighteen inches in length, and resembles the marten in form, being somewhat longer than the polecat in proportion to the thickness of its body. It is a native of Siberia, Kamschatka, and various islands which lie between that country and Japan, as also in Lapland. It burrows in holes, by the banks of rivers, and under the roots of trees. Its nest consists of moss, small twigs, and grass.

This animal does not appear to be so destructive as others of the tribe, its chief food in winter consisting of berries of different kinds: in summer, however, before these ripen, its necessities force it to prey upon hares, weasels, ermines, and other small animals.

The female brings forth in the spring, and produces from three to four at a birth.

M. Gmelin mentions two of these which he had in some measure domesticated. He says, that, whenever they perceived a cat, they would raise themselves on their hind feet, and with their fore paws prepare to defend themselves. During day, more particularly after eating, they always slept, and frequently so soundly after a meal, that they required to be pricked, pinched, and shaken, before they would awaken; but that at night they were extremely active and lively.

The fur of the sable is dark brown, whitish on the head, and gray on the throat. Its chief quality consists in the hair turning with equal ease to either side: the darker the colour, it is the more valuable; and few skins are in higher estimation than that of this animal: one of these, although only about four inches in breadth, has been sometimes valued as high as fifteen pounds. The general price, however, is from one pound to ten, according to the quality. The bellies of sables, about two fingers in breadth, are sold separately from the upper parts, and generally in pairs, which are tied together in bundles of forty pieces, and bring from one to two pounds each bundle. The tails are also a separate article of commerce, and sell at from four to eight pounds a hundred.

The time of hunting the sable in Siberia, and other countries, is from November to February, during which period the skins are in the highest perfection: those taken at any other time of the year are far inferior, on account of the irregularity of the length in the hair, and, consequently, bring lower prices.

Instances have occurred where the skins were of a snowy whiteness, but these are exceedingly rare, and sell high as curiosities.

The principal hunting of the sable is carried on by criminals banished to the snowy confines of Siberia; and in this employment they are frequently exposed to great privations. They are obliged to furnish each a certain number of skins, and, for their encouragement, are permitted to share among themselves whatever skins they procure above the allotted number. In the pursuit of sables, the hunters form themselves into small troops, under a leader of their own choosing: they penetrate far into the bosom of the mighty woods which cover this desert region, from whence they can only find their way back by marking the trees as they advance, and by missing which, on their return, they frequently perish, from their stock of provisions being exhausted before they can reach the confines of the forest. The pursuit of the sable is an arduous one; for, after they have traced the animal from its track on the snow to its retreat, they place their net over its hole, and are sometimes obliged to remain for days watching it, till hunger forces the creature out. Such are the hardships our fellow-men are often exposed to, for the gratification of vain show among the luxuriant and opulent.

A RATCLIFFE HEROINE IN REAL LIFE.

In the year 1746, a short time before the battle of Culloden, the Castle of ——, in the north of Scotland, was inhabited by its then proprietor, Captain D—, a young officer of the royal army, and zealously attached to the house of Brunswick; by his sister, a young lady of a timid disposition and delicate health; and by her particular friend, Miss M—, a daughter of Lord R—, a woman of superior understanding and great resolution, and as much attached to the throne as the proprietor of the castle. This castle (now destroyed) was of great extent, and, from the superstition of the natives of the country, had for many years acquired the reputation of being haunted. Captain D—, who had lately quitted the Duke of Cumberland's army, to which he was shortly to return, appeared for some time extremely thoughtful; and one day when his sister was confined to her room, he told Miss M— he wished to have some private conversation with her, and to entrust her with a secret which had hitherto been carefully preserved in his family, and never disclosed but from father to son, so that never more than two persons had been in possession of it at the same time: that he would have revealed it to his sister, but that he did not think she possessed strength of mind and resolution enough to make the proper use of it; and as the time was now come when it was necessary for this important secret to be confided to some person besides himself, he entreated her, as a friend to his family, to become the depository of it, and to undertake the necessary engagements attached to the possession of it. Miss M—, unwilling to bind herself to an undertaking of which she did not know the extent, and in which she found that fortitude was a necessary qualification, which necessarily implied it might be attended with dangerous consequences, begged to be excused from a trust of such magnitude as this appeared to be, and wished to decline any farther communication on the subject. But Captain D— was not easily deterred from his purpose, and conjured her, not only by the friendship she professed, and which he knew she had for the family, but if this motive was not sufficiently powerful, by the still more important consideration that the safety, and even the existence, of the English army under the Duke of Cumberland must depend on her resolution and exertion, as he knew no one else at this critical moment in whom he could confide this important secret. Staggered by these forcible arguments, and relying on the well-known honour and integrity of Captain D—, Miss M— was at length persuaded to give a reluctant consent to her friend's entreaty, and agreed, that, after all the inhabitants of the castle were gone to rest, he should call upon her for the fulfilment of her promise. Accordingly, about one o'clock in the morning she heard a gentle tap at the door. She was in trembling expectation of the signal, and leaving the chamber, accompanied by Captain D— to the library, where he had provided two cloaks, in one of which he wrapped Miss M—, and throwing the other over his own shoulder, took a dark lantern which he had prepared, and called on her to summon all her resolution, to recollect the vast importance of the duty she had engaged in, and to follow him without fear, as he would lead her into no danger. He then conducted her up several flights of stairs to a part of the castle she had never been in, and which had never been inhabited in the memory of man. They then descended into the vaults of the castle, and, mounting another flight of steps, found themselves in a court, which they traversed. Miss M—'s courage so completely failed her in the course of their progress, that she stopped, and once more entreated Captain D— to be relieved from her promise, and permitted to return to her apartment; but he urged her to proceed by every argument in his power, and assured her they were almost arrived at the place of their destination, and had no cause for alarm. Ashamed at her own want of resolution, she once more agreed to proceed if the distance was not great. They reached the opposite corner of the court, and arrived at a low door, at the bottom of a turret, which opened with a key with which he was provided. As soon as Miss M— had entered this door, he locked it in the inside, took the key with him, and desired her to observe exactly what he did. He then took her up a narrow winding staircase, at the top of which he unlocked a door, and closed it after them, when they found themselves in a small square stone chamber, which had only one small window, closed by a shutter opposite the door. In the middle of the floor was a large trap-door, to which Captain D— applied a key, unlocked it, and lifted up the trap, beneath which a sort of ladder staircase led to a chamber below. He went first with his lantern, and assisted Miss M— to descend; and when she reached the bottom, he informed her they were now arrived at the place concerning which so much secrecy was necessary; that in this room, unknown to any one but himself, were concealed all the title-deeds, papers, and other effects of value belonging to his family; and that this chamber had, in all the troublesome times of which Scotland had unfortunately seen so many, been considered as a secure asylum for any of the family, who, from the distraction of the times, had required such a place of concealment. But this room now contained what was of still more importance; for the fate of the English army depended upon the security of that chamber. The Duke of Cumberland, on his arrival in Scotland, expressed great anxiety for the security of the large sums he had brought with him for the payment of his troops, and other purposes attending so important a crisis. Captain D—, aware of the security of this place of concealment, offered the use of it, which had stood undiscovered for ages, to his royal highness, who, well aware of his unshaken loyalty, had willingly accepted it, and entrusted Captain D— with the concealment of his treasure, from which he would receive weekly supplies without danger or suspicion. Captain D—'s situation in the English army required his presence there; and it was to be the guardian of this secret, and the keeper of this treasure, for which he wanted a person of honour and resolution, which induced him to repose his confidence in Miss M—, who, from her residence with his sister, would excite no suspicion, as the reception of a stranger in the absence of Captain D— might have done. Miss M—, aware of the importance of the confidence reposed in her, promised to fulfil her engagement, by descending alone every Thursday night to take out such sums and papers as might be necessary, and to deliver them next morning to a servant whom Captain D— was to dispatch from the army to convey them to him. This arrangement being made to Captain D—'s satisfaction, and to Miss M—'s great anxiety, they returned in the same manner they came, to the habitable part of the castle, Captain D— entreating her to observe exactly what he did in their progress, that she might be sure to proceed in safety. He re-conducted her to the chamber, delivered to her the key, and after the most fervent thanks, took his leave, and the next morning early departed for the army. Many were the anxious moments to Miss M— between the morning of his departure, and the fatal night in which she felt bound by every tie of honour and duty to fulfil the engagement she had entered into. Though a woman of great spirit and resolution, she was not totally free from that superstition for which her countrymen, notwithstanding their

strong sense and informed minds, are so remarkable; and the idea of her solitary expedition at night through the uninhabited parts of this remarkable castle, added to the high importance of the charge with which she was entrusted, weighed heavily on her mind, and rendered her less equal to the task. When the eventful night arrived, no fears nor sufferings of the mind could deter her from fulfilling, to the best of her power, the engagements she had entered into; and in the dead of the night, at the time appointed, she left the chamber with the keys, the cloak, and the dark lantern, with which Captain D— had furnished her; with hurried steps, and a palpitating breast, she traversed the long passages, mounted and descended the long flights of stairs, passed through the vaults, and at length found herself in the court in which formerly her courage had failed her. She proceeded without a moment's hesitation to the foot of the turret, unlocked the door, and, according to Captain D—'s particular injunctions, locked it in the inside, and taking the key with her, went up the winding staircase. She unlocked the door, and entered the square stone room; but impatient to complete her task, that she might meet with as few impediments as possible in her return, she did not close and lock the door after her, but left it a little ajar. Finding something particularly close and gloomy in this chamber, she unfastened and opened the window, not considering that her light might possibly betray her. She unlocked and lifted up the trap-door, congratulating herself that her task was nearly completed. She descended with her lantern in her hand, and had already proceeded above half the way down, when she was alarmed on a sudden by a tremendous noise from the chamber above. The trap-door at the same moment was closed with a thundering clap, and terror so completely overwhelmed her, that the lantern fell from her hand, and she sunk lifeless at the bottom of the steps. She was not hurt by the fall, and when she began to recover, she listened attentively if she could hear any footsteps or voices that might in any way account for the cause of her alarm; but all was still and silent. After waiting for a considerable time, she began to flatter herself that some accidental cause had created those tremendous sounds. She ventured up the ladder, intending, by lifting up the trap-door, to re-enter the stone chamber, and, by waiting till day-break, endeavour to regain the apartment before the family were stirring. But how great was her dismay, how unutterable her anguish, when she found that the trap-door was secured in a firm and immoveable manner from above, that no power or force she could use—and her exertions were the last efforts of despair—could move it in the least degree! As the lock was not a spring-lock, there was no way of accounting for what had happened, but by the idea that some rebel or enemy of the family had discovered the fatal secret, and had condemned her to the most painful and lingering of all deaths. Finding all attempts at escape hopeless, and exhausted by her fruitless endeavours, she resigned herself to her fate, and, submitting unrepining to the will of providence, all earthly hope was past. She felt that she must die, but lost her life in a good cause, and had a conscience free of offence towards God or man. She descended the ladder, wrapped her cloak round her, and feeling herself growing faint, sunk on the ground, where her senses forsook her, and she lay motionless at the bottom of the steps. How long she remained in that state is not known, but when, after a lapse of some hours, her senses began to return, she imagined she had already passed from this world to a better, and that she was then in heaven: as her senses grew less confused, she began to distinguish a form bending over her, and concluded it must be an angel come to comfort her. At length she found herself lifted up and carried up the ladder; and the first breeze of outward air reviving her, she at length began to distinguish surrounding objects. She again found herself in the square stone chamber, and perceived that she was supported by Captain D—. The whole of her sufferings appeared like a dream: and it was some time before she could comprehend the cause of the danger, or the means of her deliverance. When she was quite recovered, Captain D— explained to her that the cause of her alarm arose from her having left the door of the stone chamber ajar, and having opened the opposite window, a sudden gust of wind had blown open the door with violence, so as not only to knock down the trap-door, but to open beyond it, and cover the hinges in such a manner as rendered it impossible to open it by any effort from below, and it was with considerable difficulty that Captain D— himself was able to close it so as to enable him to lift up the trap-door. The occasion of his arrival, at so critical a moment, to her deliverance, was, that, after he had dispatched the servant to fetch the necessary supply, he recollected some papers which were immediately necessary to be provided, and which he had not pointed out to her. He went to her apartment on his arrival, and was alarmed to find her absent, and that no one knew what was become of her. It immediately occurred to him that some accident must have befallen her in the secret expedition, and he set out in quest of her. He arrived at the door of the turret, which she had locked from within, but he was fortunately provided with a key. The confusion in which he had found the chamber above, and not receiving any answer to his repeated calls, alarmed him extremely: he forced back the door, fastened it, lifted up the trap-door, and at the foot of the steps perceived her lying to all appearance dead, as she had lain in a fainting fit for some hours. The air, however, soon revived her, and the open window explained the cause of what had nearly proved a fatal accident to an amiable and deserving woman.

This wonderful escape was related by the heroine, many years after it had happened, to a party of young people, who were relating many alarms they had met with; and she with great truth observed, that few people could relate a tale of more terror than what had happened to herself in the memorable year 1746.

DISCOVERIES IN AFRICA.

The northern part of Africa lies in the form of an oblong, which, from east to west, is about 3000 miles in length, while its breadth, from north to south, is nearly 2000. This large section of the earth's surface is not, on the side towards Europe, penetrated by any of those rivers, bays, or arms of the sea, which, in the other continents, give admission to ships and commerce, and facilitate the intercourse of foreign nations with their inhabitants: it presents, on the contrary, along the greater part of its sea-coast, an unbroken barrier of deserts or mountains, which approach too near the sea to allow existence to rivers; and it is hardly furnished in any quarter even with good harbours. The country on the north coast is in some places fertile and inviting to a certain distance inward; but beyond that begins the region of deserts, which prevent all regular communication with the countries beyond. These barren and sandy tracts extend from east to west, the whole length of the continent, in a straight line betwixt Cairo and Cape Nun, and are from 400 to 1000 miles in breadth: they are totally destitute of water, and of every green thing; while, from the nature of the sands, which are continually shifting their places, no road or beaten track can be made through them. The only travellers who make any attempt to pass are the caravans of native merchants; and even these, accustomed as they are to the climate, and acquainted with the precautions necessary for meeting the dangers of the journey, often fall victims to fatigue and want of water; the slaves whom they purchase in the interior, to bring for sale to the coast, frequently die by the way in hundreds, till the whole road is strewed with their skeletons. From these causes, the countries lying behind the deserts, have, both in ancient and modern times, remained unknown to Europeans; and though reports were always circulated magnifying their extent and fertility, these only served to whet curiosity, without pointing out any channel by which more satisfactory information could be attained.

Among other accounts which were received in this way, it was mentioned that the interior of Africa was traversed by a large river called the Niger, whose course lay east and west, reaching almost from one extremity of the continent to the other. Access to this magnificent stream was naturally sought with great eagerness by the trading nations, because it was evident that its navigation would command the whole commerce of Africa, opening up a means of intercourse with populous and fertile countries, which, from the earliest times, have been said to lie in its interior. Nothing, however, was precisely known of this imaginary river (as it was sometimes believed to be). Several of the ancients who were supposed to mention it, spoke of it as flowing eastward, from which it was believed to be a branch of the Nile, and to fall into that river before it reached Egypt; by others it was said to have a westward course; and this, when the river Senegal was discovered on the south-west coast, led to the supposition that here at last was the celebrated river of interior Africa. It was still felt, however, that neither the Senegal nor the Nile, though both large rivers, approached to the magnitude and importance which was looked for in the "Nile of the Negroes;" and there were many of the best authenticated facts, relating to that celebrated stream, with which the appearances observed concerning these did not correspond. Its situation and course still continued, therefore, as mysterious as ever; and many travellers, in the hope of reaching it, and of discovering the celebrated cities said to flourish on its banks, went out to sacrifice their lives in the sands of Northern Africa, or in the marshy shores, equally fatal to Europeans, which lie at the mouths of its southern rivers. The fates of these brave men, who almost all perished, contributed to give farther interest to a question which seemed to defy solution. In the year 1795, our countryman Park was at length successful, having, after many dangers and hardships,* reached the banks of the magnificent Niger, which he found flowing to the east, through countries fertile, populous, and extensively cultivated, but as little known to Europeans as if they had existed in the moon. He travelled along its banks for about 100 miles, in the hope of being able to reach the city of Timbuctoo, long celebrated as a great trading emporium among the African nations: he found it impossible to proceed so far; but, in a second journey (1805), he embarked on the stream with several Europeans and natives, in the hopes of examining its whole course, and reaching its termination in the sea. Unhappily he lost his life, through the violence of some of the native chiefs, after he had passed the most dangerous part of the navigation; and no certain accounts of his fate were received for nearly twenty years after.*

The discoveries of Park only served to whet curiosity, and to show more clearly the magnitude and importance of the Niger, while its termination, or the means of obtaining access to it by ships, remained as little known as ever. Some believed that it fell into the sea on the coast of Congo; some, that it would still turn out to be the Nile; and others, that, like the Heermund or Etymandee of Persia, it was lost, after a prolonged course, in a salt marsh in the interior. After many unsuccessful efforts by individual travellers, an exploratory mission was at length sent across the desert from Tripoli on the north, to the interior southern countries, by the British government. The gentlemen composing this expedition made many most interesting discoveries concerning the populousness and fertility of the unknown African countries in the interior; they visited also a large fresh-water lake called the Tchad, into which two considerable rivers discharged their waters, and on whose banks they saw extensive cities, Loggun, Bornou, &c., well advanced in civilization. They heard, at the same time, of the great river which was the principal object of their inquiry, but were unable to reach its banks, though one of the gentlemen approached it within a distance

* Mr Park, of whose amiable feelings the reader is already aware, gives the following touching account of his situation at a particular part of his first journey.—"Whatever way I turned, nothing appeared but danger and difficulty. I saw myself in the midst of a vast wilderness, in the depth of the rainy season, naked and alone, surrounded by savage animals, and men still more savage. I was five hundred miles from the nearest European settlement. At this moment, painful as my reflections were, the extraordinary beauty of a small moss in fructification irresistibly caught my eye. I mention this, to show from what trifling circumstances the mind will sometimes derive consolation; for, though the whole plant was not larger than the top of one of my fingers, I could not contemplate the delicate conformation of its roots, leaves, and capsula, without admiration. Can that Being, thought I, who planted, watered, and brought to perfection, in this obscure part of the world, a thing which appears of so small importance, look with unconcern upon the situation and sufferings of creatures formed after his own image? Surely not. I started up, and, disregarding both hunger and fatigue, travelled forward, assured that relief was at hand; and I was not disappointed."

Upon this incident, a blind boy, named Alexander Letham, an inmate of the asylum for such unfortunate persons at Edinburgh, composed, about two years ago, the following verses:—

Ah! lovely flower, what care, what power,
In thy fair structure are displayed
By him who reared thee to this hour
Within the forest's lonely shade!

The tender stalk, and fibres fine,
Here find a shelter from the storm;
Perhaps no human eyes but mine
Ere gazed upon thy lovely form.

The dew-drop glistens on thy leaf,
As if thou seem'st to shed a tear—
As if thou knew'st my tale of grief—
Felt all my sufferings severe!

But, ah! thou know'st not my distress,
In danger here from beasts of prey,
And robbed of all I did possess,
By men more fierce by far than they.

Nor canst thou ease my burdened sigh,
Nor cool the fever at my heart,
Though to the zephyrs passing by
Thou dost thy balmy sweets impart.

Yet He that formed thee, little plant,
And bade thee flourish in this place,
Who sees and feels my every want,
Can still support me by His grace.

Oft has His arm, all strong to save,
Protected my defenceless head,
From ills I never could perceive,
Nor could my feeble hand have staved.

Then shall I still pursue my way
O'er this wild desert's sun-burnt soil,
To where the ocean's swelling spray
Washes my longed-for, native isle.

* We owe an apology for here adverting to the discoveries of Park so soon after detailing these more at large in an account of his life. The reader will probably think we sufficiently atone for the repetition, by taking the opportunity of introducing the following interesting document, which has been placed in our hands by one of Mr Park's relations—namely, the last letter ever received from him by his friends in this country. It was written the day before he set forward upon his fatal expedition, and has never before been printed. The gentleman addressed was the traveller's father-in-law.

"Rayee, River Gambia, April 26, 1805.

"That I have not wrote you sooner you may be sure was not from want of attention, but from want of time, and because I knew that you must have received every information respecting our procedure from Alexander. I know that you will rejoice to hear that we both of us keep our health, and that the kind hand of Providence has thus far made our journey prosperous. We set off to-morrow morning for the interior, with the most flattering prospect of finishing our expedition in the course of six months, with honour to ourselves and benefit to mankind. I need not tell you how solicitous I am about the welfare of my dear Allie and children. Though I have no hopes of hearing from her till my return to England, yet I will indulge the hope that all is well. In case it should please the Almighty to take me to himself, I have thought it necessary to give a statement of my money matters in the enclosed letter, that my dear wife and children may reap the reward of my industry. I did not do this from any thing like second sight, but merely to guard against a possible occurrence. I am far from being in the least down-hearted: indeed, I have so much to attend to, that I have but little time to myself. I receive great benefit from Alexander, who is as systematic, cautious, and careful as ever. I sometimes think he has forgot his old maxim, 'Take it easy.' I can easily imagine how little Ibi [Elizabeth, his infant daughter] will be stotting about the house and garden. Tell her, if she can say her questions [the Catechism] well, I will bring her two new frocks. My compliments to Mrs Anderson, George, Thomas, and Bell. I suppose Andrew will be in the army by this time. When we return to the coast, if we are lucky enough to find a vessel coming directly to England, I think we may be in England by the month of December, but if we have to go round by the West Indies, it will take us two months longer.—With best wishes for your health and prosperity, I am your affectionate friend,

MUNGO PARK.

"Mr Thomas Anderson, surgeon, Selkirk,
North Britain."

of 100 miles, and obtained full intelligence concerning the fate of Park. The natives were able to inform them that the river fell into the sea, but at that distance in the interior could say nothing as to the point on the coast where its mouth was to be looked for. In order to ascertain this, a second expedition was sent under Clapperton, the only survivor (save one) of the first mission, which was to land on the south coast, and proceed northward to the countries in the interior, where they had heard of the river formerly; from whence their design was, after some negociations with the chiefs, to embark on the river, and sail down to its mouth.

Clapperton reached the Niger, and had at last the satisfaction of seeing this magnificent stream in the lower part of its course, where its magnitude is much greater than at the place where it was first described by Park. He then passed on to the capital of Bello, the African king by whom he had been first entertained. He found that person, however, now much changed in his disposition towards him, and disposed rather to thwart than forward the object of his voyage. The impediments thus thrown in his way had such an effect upon the mind of this sanguine and enterprising officer, that his health rapidly failed. He died, and was buried by his attendant, Richard Lander, now the only survivor of the whole party.

Lander, thus left alone, made an adventurous effort to complete the objects of the expedition, and to ascertain the course and termination of the Niger, but was baffled from the disturbed state of some parts of the country, and was obliged to return to the coast by his former route. On coming home to England, the intelligence and enterprise which he had shown recommended him to government as a fit person to complete the discoveries which had been begun by Clapperton and his companions. Lander, accordingly, went out with his brother, and landed, as before, in the Bay of Benin (1828). The account of their journey is most interesting: The two brothers, who had been equipped by the government, and furnished with small presents to the native chiefs and princes, were in general well received by all ranks, and were able at last to accomplish the objects for which so many expeditions had been undertaken, and so many travellers had died.

They reached Boussa, a large city on the Niger, and the capital of a considerable kingdom. At this place there occurs a series of interruptions in the bed of the river, which, from some cause not explained, is said to be contracted in one spot to a very small breadth, without increasing either in depth or velocity—a strange phenomenon, if correctly observed. The travellers from Boussa sailed up the stream, for a considerable distance, through a line of navigation broken by shallows and rapids, but amid a country every where fertile and beautifully cultivated. They then returned to Boussa, and engaged canoes to take them downwards to the sea. In this important part of their voyage they encountered much danger, both from stormy weather and from the violence and treachery of some of the slave-dealing Africans whom they encountered on the lower part of the river. Their voyage was mostly through a rich and populous country; and they at last reached the salt water, and saw the Niger enter the sea by a number of mouths in the Bay of Benin. These had been long known to European seamen, but were by them imagined to be separate rivers, leading to different parts of the country; and it was only Reichard, Macqueen, and a few who had been convinced by their arguments, who conjectured that they united at a short distance inland to form the large stream of the Niger.

In descending the river, the Landers made a second discovery, hardly inferior in importance to that which was the principal object of their voyage. It had been conjectured by Macqueen, Bowditch, and others, on the evidence of native merchants and the Arabian geographers, that at some point on its lower course the Niger was joined from the east by a stream not much less than itself in size, and which would, of course, open up a channel for ships and trade, as far to the eastward in Africa as the Niger itself reaches to the west. This river had been heard of by Browne, who penetrated into one of these eastern districts, called Darfoor, and that traveller even names some of the tribes who live on its banks: a stream corresponding to the same localities had also been mentioned to Major Denham, one of the gentlemen who accompanied Clapperton on his first expedition. The existence of the eastern river had therefore been ascertained;* but the Landers now passed its mouth, and actually saw it discharge its waters into the Niger; its magnitude corresponded entirely with the reports which had been received concerning it, and they mention the name of the same tribe (Yem-Yems) living on its banks who had been heard of by Browne on the confines of Abyssinia. The fact, therefore, which had been reported from the earliest periods, that there was a communication by water in the interior of Africa from one extremity of the continent to the other, appears to be completely verified. By means of the Niger on the western part, and the Tchadda on the east, there can be no difficulty in passing by boats, from the vicinity of the Egyptian Nile, to the sources of the Senegal—an inland navigation of 40 degrees, or nearly 3000 miles in a straight line. This is an advantage enjoyed by Africa, analogous to that which the rivers Ohio and Missouri, stretching in opposite directions for almost the same extent, and meeting in the Mississippi, offer to central America. The Niger, however, is in one place, as we have seen, broken by rapids and shallows (somewhat like those of the St Lawrence), which injure its navigation for about 100 miles; and the Tchadda may have some similar impediments, though, from the level on which it flows, they are likely to be less considerable.

There is another interesting circumstance connected with the Tchadda. We mentioned that Clapperton and Denham, in their first journey, saw a large freshwater lake in the interior (called the Tchad), which received the waters of two or three considerable rivers. They heard of no outlet by which this lake communicated with the sea; but it is well known that all inland lakes which are *without an outlet* have their waters salt or brackish: the Dead Sea, the lakes Aral, Van, Urumea, Baktegan, Zaweh, are examples of this fact, and others might be named, not one instance being known to the contrary. It seems unavoidable, therefore, that this African lake, "*whose water,*" says Major Denham, "*is sweet and pleasant,*" should also have an outlet to the sea; and as the river Tchadda, in the lower part of its course, is only separated from its basin by a single chain of mountains, and there is no other large stream in its vicinity, the probability is that this river communicates with the lake. Other facts have been mentioned by African geographers which lead to the same conclusion. The bed of the lake is supposed to be about 1000 feet above the level of the sea, which, considering that the course of the river must be above 1500 miles, affords ground to suppose that the current is not broken by rapids, and may be navigable to its head waters. The facts at present known, therefore, favour the conclusion, that navigation may be practicable from the sea to this interior lake, on which the populous states of Bornou, Loggun, &c. are situated. Should this be really the case, the consequences would be of more importance than it is at present possible to anticipate.

The countries to which access has already been gained are sufficiently described in the travels of the Landers, and of Clapperton and Denham, to enable us to judge of their capabilities for commerce. They were previously as little known in Europe as America was before the time of Columbus, and their discovery lays open to enterprise and to observation a field as new as did that of Mexico and Peru. Their civilization is sufficiently far advanced to make commerce an object of importance with them, and property is as secure as in any part of India not directly under the government of Britain. The Landers saw large cities, in which there were regular fairs, and numerous commodities, such as cloths, fine mats for carpeting (a general luxury in warm countries), iron utensils of different kinds, grain, vegetables, nuts and fruits, dye stuffs, muskets, and slaves. In one place they heard the hum of voices on a market day, two miles before they approached the city where it was held. As a proof of the security of property, and the undisturbed peace of some districts, they saw large herds of cattle grazing in the fields under the care of children. They sent out their servant with valuable European goods for sale in the villages, and had no fears except for his own honesty. They saw, in one place, long trains of women going to market, with baskets on their heads filled with vegetables, &c.; and, in others, lines of pack-horses were observed, arriving from remote districts with produce for sale. It is not asserted that the country is in a high state of civilization, or that it is governed by written laws: on the contrary, the governors are frequently changed and assassinated; but the people, in the meantime, take little interest in such matters. They are at peace, they cultivate the soil, and they have many commodities which they would gladly dispose of for the new luxuries which Europeans can afford them. They produce indigo, palm oil, rice, gums and dye stuffs, hides, and the skins of wild animals, while their country is perfectly fitted for the cultivation of sugar, cotton, tobacco, cocoa, pepper, and all the other staples of tropical countries. Were the people savages, or tribes addicted to war, or were they even the subjects of any widespread despotism, which, in its caprice, might declare against all intercourse with foreigners, in such cases all these advantages would be thrown away. But they are a quiet, inoffensive, and even industrious race, resembling, in many respects, the inhabitants of the plains and river countries of India. The commerce of England may, therefore, derive the very highest advantages from the communications now opened with them.

Some enterprising merchants of Liverpool and London, who appreciate the importance of the discoveries which have been made, have sent out two vessels (one of them a steam-boat built of iron) to examine with care the navigation of the two rivers, and their tributaries. Favourable accounts have been received of them up nearly to the period of their entering the Niger.

* This river is mentioned under various names, being called sometimes the Tchadda, sometimes the Quarra, and at others the Quœlla and Quœrra. All these are merely different ways of pronouncing the same word; Tchadda, and Quadda, or Quarra, passing into one another, like our *church, kirk; birch, birk,* &c. Quadda, Quarra, Quolla, are too like each other to be mistaken. The word Quadda, Quadd, or Tchad, is applied to all rivers and lakes in Africa, and seems to mean simply "*water.*"

BEGINNING AT THE WRONG END.

It is justly observed by a modern writer, in alluding to the general ignorance of mankind respecting the wonders of creation, and the manifold objects for instruction and delight with which the Almighty has surrounded him, that the "*neglect of small things* is the rock on which the great majority of the human race have split;" and the aphorism is equally applicable to the domestic and worldly condition of very many individuals. Our readers must all, in the course of their lives, have known one or more persons, upon whose exertions for advancement in life an irremediable ban of misfortune appears to have been laid—who, with every advantage in their favour—natural ability, sober and industrious habits, advantageous situation, good connections—every quality and opportunity, in short, by which people are generally supposed to raise themselves in the world, seem, nevertheless, doomed to a life of unrelieved poverty, hardship, and discomfort. Of these people, it is charitably said by their friends and connections, that "the world goes against them." They are represented as the victims of an unhappy destiny, against which it is in vain for them to strive; as beings, in short, specially excluded by Providence from all the chances of worldly prosperity and success enjoyed by their fellow-creatures. Leaving out of view the somewhat heterodox nature of this doctrine, as well as the pernicious and disheartening influence which the propounding of it must have on the minds of youth just preparing for the struggle of life, we will venture to say that nothing, generally speaking, can be more utterly hollow and fallacious than the conclusion here come to. That there are many really unfortunate people in the world, we are far from being inclined to dispute; nay, if the evil did not far outbalance the good fortune of life, it would not be what the Almighty decreed it—one of trial, disappointment, and suffering. But where men are driven back, or prevented from getting forward in the world by a downright series of misfortunes, these are generally so evident and palpable, as to be seen, understood, and sympathised with, by their fellow-creatures. With regard to the individuals above spoken of, on the other hand—those whom the world is said to "go against," and whose lagging behind their fellows in the career of life can be traced to no particular cause—we are convinced that in nine cases out of ten their "unhappy destiny" is attributable solely to some flaw or imperfection in their own conduct or character. In short, we have great faith in the aphorism of the poet in these matters, that

> "We make ourselves our own distress,
> We are ourselves our happiness."

This fatal bar to advancement in life consists sometimes in a natural inaptitude for the business of it; but much more frequently from some mismanagement in the finance department—a miscalculation of the expenditure to the "ways and means;" and, in short, a general want of attention to those little matters of economy by which (to use a homely phrase) the two ends are made to meet. We pointed out in a late number how imperceptibly, but fatally, the giving way to a habit of laying out small sums on unnecessary matters, eats up a man's means, and we daily see instances of families, who, with very limited incomes, by dint of sheer domestic management, not only make a more respectable figure out of doors, but appear even more comfortable and contented within, than others with double or triple their income. As one fact, however, is worth a thousand arguments in what concerns the practical matters of life, we will narrate an anecdote illustrative of the present subject, which was lately brought under our observation, and for the truth of which we can with safety vouch:—

In a certain burgh, which it is needless to particularise, wonned a worthy couple, who, by dint of persevering industry, had realised a handsome competency literally out of nothing. Their family consisted of one son, whose proper settlement in a respectable way of doing, as they themselves had retired from the cares of business, was now almost their only earthly concern; and as they had proved, in their own persons, both the misery of poverty and the blessings of independence, they thought they could not do better than rear him to the same line of business in which they had themselves succeeded so well. In process of time, accordingly, Mr Thomas was installed in suitable premises in an excellent locality of the burgh, and an ample and valuable stock of goods was laid in; he was well connected, and still better recommended

through his father's influence; on the latter account, too, his credit stood high in the trading world. In short, no young man in his way of business could possibly start in life with fairer prospects of success. On his own part, nothing seemed wanting to fulfil the expectations entertained by his friends. He was a sober, industrious young man, regular and correct in his private habits, assiduous in attending to his business, and as his goods were both excellent and cheap, his customers every day increased, and every one thought he was rapidly and deservedly realising a fortune. Guess the astonishment, then, of all and sundry, when, in about a year and a half after his opening shop, Mr Thomas ———, or rather his worthy sire, found it prudent to close it again; and the friends of the parties learned, that the paternal funds were minus a good many hundred pounds by the speculation? Here was a poser for the trading quidnuncs of the place! The matter was to them perfectly incomprehensible. It seemed like that which had hitherto been supposed an impossibility in nature—an effect without a cause. Mr Thomas had been universally reckoned a perfect pattern of what a man ought to be who wished to thrive in the world. In fact, he had been held up to all the young men in the neighbourhood as a model whereby to fashion their own conduct. Neither was he of an adventurous turn of mind, nor had he met with any serious losses in trade to account for his "misfortune." As there was no feasible way, therefore, of explaining the matter, the usual verdict was, of course, passed upon the occasion—that, in spite of all Mr Thomas ———'s efforts and industry, "*the world had gone against him.*" He was the victim of *ill-luck*, or, to speak out plainly the meaning of their words, he was one "doomed by Providence not to thrive in the world;" and all, therefore, agreed in the propriety of his parents withdrawing him, as they did, from the concerns of business to their little rural abode, as they said that "doing *nothing* was still better than doing *ill*." Shortly after the event took place, a kind-hearted lady, who had been a steady customer and warm patron of Mr Thomas ever since he "set up," and had all along admired his exemplary conduct, had occasion to call at his parents' abode about a servant's character, or some such matter, when she took the opportunity of expressing the surprise and regret of herself and friends at what had happened. "'Deed, Mrs ———," replied the sorrowing dame, "I'm sure we're a' much obleeged to yersel', and other weel-wushers, for your concern about Tam; but, ye see, the world just gaed against him, and we thocht it better to keep what we had left than rin the risk of losing a'." As the visitor did not appear altogether satisfied with this explanation, and seemed anxious to learn in *what way* the world had gone against him, the other continued—"Aweel, ye see, though Tam's a weel-behaved industrious lad, he just had na a way of managing things; and though he could *mak* siller easy enough, he wants the knack to keep it. I never could get him to understand the value o' siller, or to see that it was pence that made pounds—and the long and the short o't is, that Tam, like mony a ane, just *began the world at the wrang end!*" As this was a mode of proceeding through life which the lady had never heard of before, she begged a more particular explanation, and received the following, to which we would beg the particular attention of all young people in Mr Thomas's situation. "Ye see, Mem, when the guidman and me began the world thegither, we were just as bare as we weel could be—hardly ae sixpence to rub against anither, and no a friend to gie us a helping hand. So, Mem, we just suited our way o' living to our circumstances, and contented ourselves wi' a drap parritch and milk i' the morning, a herring and a potato, or sae, to our dinner, and our parritch at nicht again. By and by, as we began to *mak* a little, we had some guid broth and meat at dinner time, and after that a wee, we ventured on a drap tea in the morning. As things got better wi' us, the gudeman wad whiles send hame a lamb-leg for our Sunday's dinner; and od, Mem, before a' was dune, we used sometimes to treat ourselves to a *chuckie*. Now, ye see, Mem, our Tam took the clean contrair way o' going about things—*he began wi' the chuckie!*"

We now never hear of young men, placed in an advantageous situation for getting forward in the world, but who nevertheless, and without any apparent cause for their bad success, are unable to "get their head above water," but we are apt to suspect that they have "*begun with the chuckie.*"

TURKISH OPIUM-EATERS.

Rigid Mussulmans condemn the use of opium, and their preachers declaim against it from the pulpit, as our clergy do drunkenness. One day a very holy and zealous preacher, in holding forth with more than ordinary warmth against this vile drug, by great and bad luck let fall his own opium pouch among his auditory. Without being in the least abashed, he, with the greatest presence of mind, affected to have premeditated what had happened so much against his will, and exclaimed, "Behold the enemy, the demon, the fiend I have been speaking of! Be upon your guard, lest it spring upon some of you, and gain possession of your souls!" By this delicate turn he effected his escape from public ridicule or execration

AN OLD MINISTER'S TALE.

By the Ettrick Shepherd.

The Rev. Mr M'Donald of Kilmore, whom I once met at Oban on a visit, related to me a great number of Highland stories, for the purpose, as he expressed it, that I should make something of them. One of them was about John Campbell of Kilcagar, who went out one day to hunt on the lands of Glen-Orn, which then belonged to M'Culloch of Gresharvish. Mr Campbell not returning in the evening, his lady became very much alarmed, especially as his favourite pointer dog Eachen came home alone, and apparently very disconsolate, and his dam Oich did not come at all. Mrs Campbell did not know in the least where to send in search of her husband, but she raised the men-servants before daylight, some of whom went for the fox-hunter, who knew all the shooting ground in the vicinity, and they went searching and calling the whole day, but found nothing.

In the meantime, a shepherd of Glen-Orn arrived at Kilcagar, and told Mrs Campbell that he had found her husband, lying shot through the heart in Correi-Balloch, a wild wooded ravine on the lands of Glen-Orn, and his pointer bitch lying at his side moaning, but refusing to leave him. The man told his story so abruptly, that Mrs Campbell fainted, and was long unable to give orders about any thing. The body, however, was brought home, poor Oich following it, and finally buried in the island of Lismore, the burial place of the family; but Oich followed it there, and though brought home many times, and greatly caressed, she always went back again, until at last she died on the grave.

A strict investigation was immediately set on foot regarding the mysterious murder of Mr Campbell, for, as his gun was found loaded, it was certain he could not have shot himself, and, after some inquiry, Mr M'Culloch was arrested, and taken to the prison of Inverary, examined by the sheriff, and committed for trial. And here is the trial on a single leaf, which I believe is nearly the truth.

Mr M'Culloch acknowledged, both before the sheriff and the lords of the justiciary court at the circuit, that he had heard the report of a gun on his lands, had gone to the place, and, on seeing the pointers, went to the spot, where he found his friend Mr Campbell lying at the point of death; that he turned him over, when he vomited some blood, and then expired.

Mrs Campbell, on being examined, said she did not believe Mr M'Culloch would have shot her husband, although the latter should have shot all the game on the other's estate; for that they were particular friends, and always shot together, visiting each other in the most friendly and amicable way very frequently. The paper then proceeds to detail the examination of William Bawn M'Nichol.

"Where were you that morning when Mr Campbell was murdered?"

"I was in Clash-ne-shalloch."

"How far is that from Correi-Balloch?"

"Hersel does not know; she never measured it."

"How far do you think it may be?"

"Why, hersel tinks it will never be much farther than it is at present."

"In what time could you go from the one to the other?"

"She could take a tay to go it, or half a tay, or an hour if hersel was to rhun it."

"And you heard the shot fired from the one place to the other?"

"Nho, she did not hear it fired, but she heard it gho out with a great plow-off."

"And what made you leave the one glen to go to the other? Did you suspect any thing?"

"Hoo, yes, hersel did suspect something."

"What did you suspect?"

"She suspected that she would get a trham of te whisky, or te rhoom, or te prhandy at lheast; and may pe a shilling into her sporran."

"And what did you see when you arrived?"

"Hersel saw Mr Campbell's two dhogs sitting with their tails upon te ground, and one of them was poohooing; and then when she came dhown, there was Mr Campbell himself lhying, and grheat strheam of plood running down from his pody."

"And was he quite dead then?"

"Hoo, yes, him was very dhead."

"And did you see any other person in the Correi that day?"

"Nho; she saw'd no other pody but Mr M'Culloch, who was rhunning very strong up the Balloch."

"Was it towards his own house that he was running?"

"Nho!—such a question! It would pe lhong pefore rhunning up to Balloch would take him to his own house. His own house lies down there, and he was rhunning here."

"And what did he do when you came to the corpse?"

"He turned back again, and came to me, and desired me to go with all haste to Kilcagar, and tell Mrs Campbell that her husband was lying in te Correi shot and dhead, and mhoordered, which I did with a heavy heart; for Mr Campbell was a good and kind man."

"Did you never hear of a great beauty, named Anne Gillespie, who did not bear the best character in the country?"

"Hoo! hersel will be telling you whatever she has seen with her own eyes, but she will swear to no reports."

"Was she not lost about the time of Mr Campbell's death, and was it not suspected that she likewise had been made away with?"

"Hersel has never saw'd her dhead nor alhive since that day, so that she may pe mhoordered, and dhead, and bhuried, or trown into te sea, and eahten up with te creat fushes, or she may pe living, and as peautiful as ever, for any ting tat hersel does know."

"You say you have never seen her since that day—did you see her on that day?"

"Hersel saw—saw—saw oich ailidh rhunning down Corrie-Deach."

"What is oich ailidh, if you please?"

"Hersel not have it in te tongue."

A gentleman here explained to the judges that M'Nichol meant a comely well-dressed young woman.

"And was that handsome young woman Mrs Anne Gillespie?"

"It might pe her and it might not pe her; she could not say. Tere were words aproad."

"How far were you from her?"

"Hoo, hersel was very near: not above two or tree miles from her."

"That is a great distance."

"Oh, it pe no distance in te Highland. If we had been any nhearer, we would have peen together."

"Did you know Mrs Anne Gillespie personally?"

"Hoo, yes, she knowed her very well."

"And what sort of a woman was she?"

"She was a very ghood, and a very peautiful, and a very plessed lhady; but she loved te shentlemans like other womans."

"Did you hear two shots from the Balloch, or only one, that morning?"

"Hersel was hearing two shots, one pefore and another afther."

A great many more witnesses were examined, but their evidences were greatly at variance, and nothing more could be elicited, save that it was certain Mrs Anne Gillespie was a person of doubtful character, and that she was lost, and that many suspected she had got foul play for her life. Finally, the counsel for the crown demanded a verdict of guilty against Mr M'Culloch; but one of the judges, in summing up the evidence, expressed his doubts. He acknowledged that the circumstantial evidence was very strong against Mr M'Culloch, yet still, taking his character, temper, and disposition altogether into view, he could hardly conceive that evidence to be thoroughly conclusive. It was true he was the only man observed in the Balloch, and was discovered running away; and when he saw that discovery was made, he turned again. His hands were bloody, and his gun was discharged. Mr Campbell had been killed by a species of shot which was found to be the very same kind as that contained in Mr M'Culloch's lead-bag. All these circumstances, taken together, formed a mass of strong evidence. But whence could spring the motive for the one friend murdering the other?—and how was Anne Gillespie concerned in the matter? He confessed he could not see his way through such a mesh. He therefore had some faint hopes that the prisoner really was not guilty. He was far from exculpating him, for it was a dark and mysterious affair, and the evidence was grievously against him; but if the honourable jury viewed the matter with the same doubts as he did, he begged they would give the prisoner the advantage of them. There was one thing he was bound to remind them of—that it was quite manifest the person who shot Mr Campbell had been close at him. Now, if the thing had taken place by accident, which was the most likely thing in the world, the prisoner would have acknowledged it, and then no blame would have attached to him; but as he peremptorily denies it, you are obliged either to return a verdict of *not proven*, or of *wilful murder*. I must, therefore, leave him in the hands of his countrymen, and may God influence their hearts to return a just and true verdict.

Mr M'Culloch appearing at that time very much affected, and like to faint, he was removed, and had something to drink. He asked the guards how they thought the verdict would go, and was answered that there was every probability it would go against him. He said he thought so too; for had he been a juryman on any other criminal, he thought he should have given it against him. The jury were enclosed, and continued in fierce and angry discussion for five hours and twenty minutes, and then returned a verdict of GUILTY, by a majority of two. M'Culloch was again brought into court, and the Justice-Clerk asked him if he had any thing to say why judgment of death should not be pronounced against him. He said he had only one very simple reason, which was, that he was as innocent of his friend's death as his own child that sat on her mother's knee. He neither blamed the judges nor the jury, for every word of the evidence was true. There was not a false word advanced against him, and it was singular how strongly they all tended to corroborate an innocent man's guilt. Had he been a juryman on the same trial, he would have voted with the majority. Therefore, he had no rea-

sons to urge why sentence of death should not be pronounced upon him; only he begged for a distant day, as he was certain the Almighty would not suffer an innocent man to die an ignominious death, and his family to be disgraced and ruined, without bringing to light something relating to that horrid transaction. He was sentenced to be executed that day six months, on the 27th of October.

Mr M'Culloch received all the admonitions of the several divines towards confession with the greatest indignation, remaining obstinate to the last, and still no light was thrown on the mysterious murder of Mr Campbell, save that, on the day after the trial, a great burly Highlander demanded a word of the Lord Justice-Clerk, who, being a proud man, received him churlishly, saying, "What do you want with me, you ruffian-looking dog?"

"Hersel just pe wanting to tell your judgeship tat you must reverse te sentence on honest Mr M'Culloch instantly, for it is not a fair one, and cannot pe a fair one."

"What do you mean, sir?"

"What do I mean? Hubabub! Did you not see tat tere was six Campbells on te jury? Te judge hersel was a Campbell, te man who was shot was a Campbell, and how could ony man get justice? If you had not been what you are, a Campbell, you could easily have seen trough tat tere could pe no shustice. And hersel can tell you, had it peen a Gillespie, a Stuart, or a M'Donald, that had peen shot, and a Campbell who had shot him, with te same judge and jury, tere would have peen no word of guilty. Now, I tell you tat you, and your jury of Campbells, are both knaves and fools, else you might have seen with your mouths, suppose you had had no eyes in te heads of yourselves, tat Mr M'Culloch was no more guilty of shooting his friend, John Campbell, than you were."

"Then I tell you that *you* are a knave, a ruffian, and a madman. Take him out, and give him into custody."

"Just stop, if you plaise, till I tell your honour's glorious majesty, tat I can give my porn oath tat when te shot was fired tat killed John Campbell, Duncan M'Culloch was half a mile off, and out of sight too."

"And how do you know that?"

"Pecause I saw it with my own eyes at a great distance."

"Who else could it be, then, that shot him?"

"Hoo, but let you and your Campbells, with your wise heads, find out tat! Tat pe your business, and none of mine. Only I'll swear tat it was not Duncan M'Culloch. Hersel will swear tat py all te oaths tat ever was made in hefen or earth. So you have no ting to do with all your wisdom, but send word over to te prison to let him forth."

"Oh, the man is mad! stark staring mad. What flummery is this? Seize him, force him out, and see that he be properly secured."

The attendants then seized the fellow, and forced him out, while he continued calling over his shoulder, "Oh you creat pig plunder of a shudge! I tell you, if you do not take tent of what I say, and let Mr M'Culloch go free, tat Cot's creat shoogement will come over you, and you will ——"

Here his anathemas were lost in the hubbub at the door, and the thing was totally disregarded by the proper authorities. It created, however, a sensation among the bystanders, and a petition was got up for a reprieve to M'Culloch. Who it was signed by, or by whom presented, I do not know; but it had not the desired effect. Reprieves and pardons were not so common in those days as now, and Duncan M'Culloch was left for execution.

Now, it so happened that the day appointed for Mr M'Culloch's execution, the 27th of October, was the very one preceding the opening of the autumn western circuit; and on that morning, as the Lord Justice Clerk and the Lord Provost of Glasgow were sitting at an early breakfast, the attendants stated to them that there was a very blackguard ruffian-looking fellow at the door, who demanded an audience of their lordships; that they had repulsed him several times, but he would take no refusal, saying that his message was one of life and death, and he must and would speak with them.

"No, no—tell him we have nothing to do with him," said the Justice-Clerk. "I like not such ruffians intruding themselves into our presence. There is danger in it."

"There shall be no danger to you, my lord, I answer for it," said the provost. "And since it is an affair of life and death, I think we had better hear what the fellow has to say. With all these attendants and ourselves, we have nothing to fear from one man; so I think, with your permission, we will admit him."

"Let him be searched, then, that he has no arms about him."

"Yes, my lord."

The fellow was then searched, and admitted, and a frightful-looking figure he was. His form was emaciated; his face the colour of clay; his beard sticking out all around, like a bottle-brush; his tufted hair protruding far beyond the rim of his crabbed Argyleshire bonnet, which he did not even deign to lay aside, but, stepping close up to the Lord Justice Clerk, he addressed him thus—"Does your honour's clorious mhajesty know mhe?"

"No, sir, I know nothing about you, nor do I wish to know any thing; keep your distance."

"Then, sir, if you do not know me, you don't know a man who has ten times more truth and honour than yourself, for all te pride and wisdom tat is pelow tat creat pig mealy wig of yours. Did not I tell you this day six months tat Mr M'Culloch was no more guilty of the death of John Campbell of Kilcagar than you was? And did you tink tat a true Highlander was coming to tell you a porn lie for nothing? And yet you are suffering tat good honest shentleman to pe dragged to the gallows this day, and hanged like a dog, for a crime of which you know he was not guilty; for did not I tell you so, and was not that enough? But here am I, Pheader Gillespie, who will not suffer an innocent shentleman to die for a crime in which he had no hand. I was loth to give up the murderer before; but since it must pe so, it must pe so. I then tell you, shentlemans, that it was I myself that shot John Campbell."

"You who shot John Campbell!" cried the Lord Provost, starting to his feet; "I declare this surpasses all that I ever heard or witnessed in my life! My lord, this is a very serious matter indeed. We must take it upon ourselves to defer the execution of Mr M'Culloch till the truth of the circumstance be ascertained, and a reprieve can be obtained."

"No, no," said the Justice Clerk; "the man is deranged, and knows not what he is saying. Justice must have its way—the sentence must be executed."

"Oh you creat stupid bhaist of a shudge, have you no fear of Cot pefore your eyes!" cried the Highlander, with great vehemence, which rather looked a little like madness from such a figure. "Remember, if you murder an innocent man, you shall have to answer for it. Did I not tell you long ago that Duncan M'Culloch was innocent, and do I not tell you now that it was I who shot John Campbell of Kilcagar. Yes; it was I who shot him trough te pody and te heart; and I was not like you, for I had te fear of Cot pefore mine eyes, and I knowed that his heverlasting tamn would fall upon me if I left an innocent man to suffer in my stead. And here I am, to take te shustice of Cot and man; so if one must suffer according to the mandate of te great Campbells, why, then, come pind my hands pehind my pack, and hang me, for I, and I alone, did the deed for which he is contemned to suffer. But I'll first be tried by a jury of my countrymen, not by you nor by your clan, although we were once the same. No; I'll object to every man whose name is Campbell; but I will not retract one word that I have uttered. I shot John Campbell, and I did it with all my heart and soul; and were it to do now, I would do it still."

"You are a braver, an honester, and a better man than your appearance bespeaks you, Gillespie," said the Lord Provost; "there is something truly noble in this voluntary confession of yours, and whatever may be the issue, you shall not want my best interests. But an innocent man shall not suffer under my jurisdiction. I must go and take measures for the preservation of M'Culloch's life instantly, for his time is nearly run. In the meantime, Gillespie, I must commit you to prison."

"You may, if you please, my lord; but hersel tinks, after what she has done, tere pe little occhession for it. If Duncan M'Culloch is once fairly released and restored to his family, I may run away if I can, but not till then."

"Well, I think I have a right to take your word, for a more gallant immolation I never witnessed, and never read of. Remain in my house, under guard, until I take measures regarding you. In the meantime, I must hasten to the sheriff and the prison, for I have no time to lose."

When the Lord Provost entered the prison, the head keeper opened the door, and announced him. He found the condemned man sitting on his straw pallet, with his wife on one side, and his eldest daughter, a girl about fifteen, on the other, both leaning on his bosom, and crying until their hearts were like to break. "I am quite resigned, and ready to go with you, my lord," said he; "you will just release me from a scene which no husband and father's heart can long sustain. I am quite ready."

"I am very happy to hear it, Mr M'Culloch; but I am happier still to inform you, that a very singular piece of information has been communicated to me this morning. A wild savage-looking fellow, calling himself Peter Gillespie, or some such name, came into my house, and before the Lord Justice Clerk and me declared himself the murderer of Mr John Campbell, and offered himself to be executed in your place, for that he alone was the guilty person, and he says that you were half a mile distant, and out of sight, when the murder was committed; so that the sheriff and I have agreed to defer your execution until a pardon can be obtained from the proper authorities."

Mrs M'Culloch fainted with joy at this intelligence. As for M'Culloch himself, he burst into tears, and exclaimed, "I said the Almighty would not suffer an innocent man to perish by an ignominious death, and a lovely and helpless family to be disgraced and ruined, and he has not disappointed me in the end! Oh, blessed, ever blessed be his name! for now that I am freed from the foul stain of murder, I regard death as nothing. But Pheader Gillespie, Pheader Gillespie to offer himself a sacrifice for me! Ah! that is what I do not deserve at his hand! Do you think the poor fellow will be condemned?"

"I am afraid he will; but he shall not want my best interests, for it was so noble of him to give up his life that an innocent man might be saved to his family."

The ladies now claimed the attention of the two gentlemen. Mrs M'Culloch was lying in a swoon, pale as death, on her husband's bosom: Miss M'Culloch was sitting with uplifted hands, her eyes fixed, and her beautiful lips wide apart, the statue of suspense, uncertain as yet whether or not her father's life was safe. It was a group well worth the chissel of Chantrey, and better worth that of lang Jock Greenshiels. That was a happy morning for the M'Cullochs, happier than if no such danger had ever hung over them. A free pardon was, of course, readily obtained from the Secretary of State's office, and M'Culloch was released.

When Gillespie's trial came on, there was no one witness against him but himself; but he delivered a plain unvarnished tale, which amply sufficed for his own condemnation. He had been prompted to the dreadful deed by a jealousy but too well founded; and it appeared that the Mrs Anne Gillespie alluded to in an earlier part of our tale, was his wife, and the unhappy cause of the murder. When asked by the judge what had become of his wife, he answered, "My wife! what is that to you, or to the present cause? That was my concern, not yours. You may try to find it out; but you never will till the day of doom." In the course of a few weeks, Pheader Gillespie suffered the just penalty of his offence, universally regretted, however, on account of the lofty principles which had urged him to the deed, and actuated him ever since.

Columns for Schoolboys.

PHŒDRUS — EUTROPIUS — NEPOS.

My Dear Little Boys—I dare to say you have often felt more annoyed than pleased when your master put a new Latin book into your hands, understood to be a good deal less easy of translation than the former one, and which seemed, in its bare, hard, dry outline, without an English word about it, one of the most unamiable objects in the world. I have often thought, that, if something were told you about the men who wrote these hard-favoured little books, and about the comparative merits of their style of writing, and the reasons the master has for bringing them under your attention, you would be apt to take to them a great deal more kindly, and learn your lessons so much the better. For this reason, I have resolved to give you all information I can about these books, assuring you, that, if I had known as much when I was a schoolboy like you, I think I would have been a much better scholar than I was.

Now, we need not tell you, schoolboys, that the first Latin book that is put into your hands to study, after the "Rudiments," is entitled, in common language, "The Cordery." We used to wonder why it was called the *Cordery*, or if it had any thing to do with the word *corduroy*. The fact is, that this little book consists of a hundred colloquies, or short dialogues, held between a tutor and some good boys, his pupils, in the Latin language. The book was not written by a Roman, or person who knew the Latin as his mother tongue—as all the rest of your Latin books were—but by a French gentleman, of the name of Mathurin Cordier, who died at Geneva in the year 1565, in the 85th year of his age. The celebrated Calvin was a pupil of his at Paris. After the colloquies, however, a much more important work comes to be taken into consideration, namely, Phœdrus's Fables; and here we have some remarks to make regarding the writing of fables or parables in general, and the probable origin of this species of composition among the ancients.

It has been thought by some learned men that fables were the first pieces of wit that made their appearance in the world; and, indeed, they have continued to be highly valued, not only in times of the greatest simplicity, but also during the most polite ages of mankind. The Jewish doctors say that the ancients were at first accustomed to teach the people with the sound of musical instruments, which rendered their lessons more pleasant; but that custom being discontinued, they next adopted the mode of mingling stories with their instructions, and the concealing of sublime truths under the appearance of fable. It has also been observed, that one of the reasons which obliged the eastern people, with whom most certainly the custom originated, to make use of fables in their instructions and admonitions, was, that the monarchs being for the most part absolute, their subjects were always restrained from freedom of speech; the result of which was, that, being an ingenious people, they found out this way whereby they might be able, without exposing their lives to imminent danger, to inform and advise their princes of what most nearly concerned the welfare both of themselves and their subjects, and instruct them, without giving offence, in the paths of virtue, honour, and true glory. Of this we have a very apposite example in the Bible, where the holy man, Nathan, rebukes David the king, by means of the parable of the poor man and his ewe-lamb. The most ancient example which we have on record, of this way of conveying instruction, is what we have in the sacred Scriptures of the Old

Testament, of the trees choosing themselves a king, as it is recited in the ninth chapter of the Book of Judges; and it was the constant practice afterwards observed by our Saviour among those to whom he spake, for, as the Gospel informs us, he explained himself to the people particularly in parables. Since that time, also, the Jews have so continued this manner of expressing their sense, and unfolding their doctrines, that the esteem they had it in cannot be concealed from those who have perused their writings; where they make the waters, mountains, trees, and even the letters themselves, to speak.

The esteem for this manner of writing was afterwards so great in the world, that the Greeks became imitators of the eastern nations in it. This cannot be doubted by any, since the Greeks themselves acknowledge that they derived this sort of learning from Æsop, who was an oriental.

This famous fabulist, of whom you have often heard, and whose productions are still commonly extant, is said to have been born, in the condition of a slave, at Cotyœum, in Phrygia, about 570 years before the Christian era. The whole history of Æsop, however, is looked upon by many authors as a fiction. The anme, indeed, appears to be taken from that of the wise man Asaph, who is much celebrated by the oriental writers; and any man of distinguished good character is by them honoured with the title of "the Asaf of his day." That the collection of fables, which bears the name of Æsop, was written by him, is an opinion which is now generally exploded; and though we learn from Aristophanes, the Greek dramatic writer, that a collection of his fables then existed, yet we are inclined to believe that he did not commit any of them to writing, but merely recited them upon particular occasions; and that they were for some time preserved by oral tradition.

The great variety of style which is to be found in this collection, leads us also to suspect that they cannot have proceeded from the same author. Yet some of them bear evident marks of antiquity. There is in them a wonderful simplicity of expression, and a delightful blending of the agreeable with the useful, which captivates and instructs the reader. Simplicity of thought, and purity of sentiment, seem to be the characteristics of his fables; and he is allowed on all hands to have been a master in this species of instruction. So famed were these compositions among the ancients, that Socrates is said to have translated them into verse a short time before his death: and Plato said, it were to be wished that children might suck them in with their milk, in order to be trained up to wisdom and virtue

Now, the next thing to be observed is, that there have appeared in the world, amongst many different nations, an immense number of imitators of Æsop's way of conveying instruction by fables. The most celebrated of these in modern times are La Fontaine and Chambaud, among the French, and Gay and Moore, among the English. The person with whom we have to do here more particularly, however, is his famous imitator among the Romans, Phœdrus, who flourished about the sixteenth year of the Christian era. About 500 years before his time, the first specimen of this kind of composition among the Romans, as we have it finely recorded by Livy, was delivered by Menenius Agrippa, one of the wisest and best of the senators of those times. It was on occasion of a sedition among the plebeians, or common people of Rome, who withdrew themselves, in a mutinous manner, to a mountain about three miles from the city, and refused to submit to the authority of the senate; upon which, Menenius Agrippa, who had been originally a plebeian himself, a shrewd man, and who consequently knew what kind of eloquence was most likely to please the people, addressed them with the celebrated fable of "The Belly and the Members," which had an instantaneous effect upon the mutineers, and ultimately led to the entire suppression of discontent among the people.

In regard to Phœdrus, the Latin fabulist, he was a poet of very considerable merit, and is generally supposed to have been a Thracian by birth. It is said that he was carried a captive from his own country to Rome by Octavius, the father of the emperor Augustus; and, from his own writings, it is certain that he was the slave of the latter—which brings him to the same condition as his great master Æsop. He appears to have owed his liberty, as well as the advantages of a good education, to the munificence of the emperor, who was a great patron of literature. The gratitude and high regard for his benefactor which he exhibits, give a favourable idea of the qualities of his heart; nor can his sincerity in this matter be at all questioned, when it is considered that he wrote as strongly in the praise of the emperor after the death of the latter as during his lifetime. At a subsequent period, he was very unjustly subjected to great persecution by Sejanus, the profligate favourite of the emperor Tiberius, which he has taken notice of particularly in his third Prologue, to the infamy of that detested character. The causes, as well as the nature of his sufferings, have not been recorded; but it may be presumed that he could give no offence by his wealth, at least, since he studiously avoided riches, lest he should thereby be exposed to danger. He lived to a great age, and survived Sejanus, whose memory he treats with a severity which would never have been allowed to escape with impunity if he had published the lines while that haughty minister was alive. Phœdrus appears to have confined himself to the writing of fable, and took Æsop for his guide. He has divided his collection into five books, containing altogether ninety-four fables, in the formation of which he has taken the old Phrygian for his director in general; but although he works upon his model, he has introduced a great many new materials of his own. The learned have extolled the purity of his language, and the sentiment frequently merits high commendation; but in many instances that might be mentioned, a greater regard to good taste and mental delicacy would have given an additional value to the writings of this amusing author.

After having got well acquainted with Phœdrus's entertaining colloquies, carried on between wolves and lambs, jackdaws and peacocks, foxes and crows, dogs and crocodiles, mice and weasels, and a great many other animals equally interesting and sagacious, we suppose you will now be inclined to proceed a little farther in your Roman studies; and for that purpose *Eutropius* next offers himself to your attention. His book consists of an abridgement of the Roman history, beginning with the foundation of Rome, and ending about the year 360 of the Christian era. This author is, by some, called *Flavius* Eutropius; but of his native country, parentage, and education, nothing certain is known. He was private secretary to Constantine the Great, and accompanied the emperor Julian in his expedition against the Persians, A.D. 363. Valens, who was a native of Pannonia, in Germany, and knew little about the Roman history when he succeeded to the throne in 364, requested Eutropius to compose his abridgement. It is to be regretted that this author did not pay more attention to accuracy of names and dates, as his work is otherwise commendable for simplicity of style, selection of facts, and agreeableness of narrative. Were it not for the inaccuracies already mentioned, which a judicious editor could easily correct, there is, perhaps, no Latin abridgement of Roman history which the young scholar would pursue with more pleasure and advantage than that of Eutropius. In certain parts of his work a few words occur, such as would not have been used by the writers of the Augustan age, which is reckoned the finest time of Roman literature; but the number of such words is not great, and they give rise to no difficulty, as they are almost all easily understood. In consequence of certain expressions which occur in his epitome, many doubts have been raised as to what the religion of Eutropius might be; but, on a careful perusal, it will at least appear manifest, that there is no evidence for believing that he was a Christian. Had he renounced heathenism, the history of the emperors whom he mentions, and the age in which he lived, would have given rise to such statements and opinions as would have entirely precluded any uncertainty on the subject. The integrity of the man and the author appears in the impartiality of his strictures, as well as in his commendation of virtue and censure of vice, which render his writings a very proper book for being put into the hands of youth; and, therefore, all well-dispositioned tyros will make themselves intimately acquainted with Eutropius.

Our next author is Cornelius Nepos, who has left us a good biographical work, consisting of twenty-two lives of illustrious men among the Greeks and Carthaginians. In the preface to a late edition of this book, it is justly observed, that "the Lives of Eminent Commanders, by Cornelius Nepos, will be a favourite school-book while the Latin language continues to be taught. The admirable models of character which it exhibits, the elevated and truly Roman sentiments which it breathes, the purity, elegance, and chaste simplicity of its style, render it, in every respect, one of the most eligible books that can be put into the hands of ingenuous youth. The lives, too, are so short and comprehensive, that, while they powerfully interest the curiosity, they do not fatigue the attention of the youngest and most volatile readers."

Cornelius Nepos was born at Hostilia, a village belonging to Verona, on the north bank of the river Po. From the place of his birth being in one of the ancient divisions of Gaul, he is called by one Latin writer *Gallus*, a Frenchman; and, from its being included in *Italy*, his countryman and contemporary Catullus, the Roman poet, denominates him *Italus*, an Italian. He died in the year 25 before Christ, and, consequently, flourished in the reign of Augustus, whose favour he enjoyed; and the purity of his style entitles him to rank high among the writers of that age. He composed a history of the world, which he called his chronicle, and which was divided into three periods or ages—the obscure, the fabulous, and the historical. To it, Catullus, who dedicates his works to Cornelius Nepos, makes allusion in his poems. That history, and all his other writings, are now lost, except the twenty-two lives of illustrious generals. These illustrious generals are, Miltiades, Themistocles, Aristides, Pausanias, Cimon, Lysander, Alcibiades, Thrasybulus, Conon, Dion, Iphicrates, Chabrias, Timotheus, Datămes, Epaminondas, Pelopidas, Agesilaus, Eumĕnes, Phocion, Timoleon, all natives of Greece except Datămes, who was a native of Caria, and Eumĕnes, who was a Thracian. After these, he takes Hamilcar and Hannibal, who were Carthaginians. Besides these, he notices, in three short chapters, some of the kings of Persia and Macedonia, and gives also interesting biographical sketches of Marcus Porcius Cato, and, more particularly, of Titus Pomponius Atticus, the familiar friend of Cicero, the orator. His book concludes with the words of Cornelia, the mother of the Gracchi. Nepos enjoyed the friendship of both Cicero and Atticus. Of numerous other works which he is said to have composed, and which time has destroyed, it would perhaps be now impossible to make an accurate list, since grammarians are divided as to their number and titles. His "Lives" form a proper schoolbook, as the style is simple, but neat and appropriate, and his delineation of character deserves approbation from its accuracy and conciseness. The following is his account of the closing scene of the life of his friend, the celebrated Pomponius Atticus, who starved himself to death to escape from the miseries of old age and disease. "Thus," says he, "when he had completed his seventy-eighth year, and had attained to extreme old age, not less with dignity than with favour and with fortune—for he had attained to many possessions through no other medium than that of honesty—and after he had enjoyed such uninterrupted good health, that, for thirty years, he had never needed medicine, he was attacked with a disease, which, at first, both he and the medical men contemned; for they took it to be a sort of stoppage of the bowels, for which several quick and easy remedies were applied. When, in this way, three months had been spent, without any pains, except those which he experienced from the attempt to cure him, all at once the power of the disease came into one part of his bowels with such vehemence, that, in the end, a putrid sore broke out through his loins. Some time before this occurred to him, however, and after he felt his pains increase, and the fever gathering strength daily, he ordered his son-in-law Agrippa to come to him, and along with him Lucius Cornelius Balbus, and Sextus Peducæus. As soon as he saw them approach, he raised himself on his elbow, and thus addressed them:—'How great the attention and diligence is, which, at this time, I have had recourse to for the preservation of my health, ye have seen with your own eyes, and therefore I need not detain you by making farther mention of it; with which, since, as I hope, I have satisfied you, and there is nothing farther to be done which can tend to the curing of my disease, it now remains for me to follow my own counsel. Of that I do not wish you to remain in ignorance; for I am determined to give up supporting this disease. For these some days, indeed, whatever food I have taken with the view of prolonging my life, has just increased my pains without the hope of recovery. Wherefore I request of you, first, to approve of my design, and, then, that you will use no vain endeavours in attempting to dissuade me from it.'"

ANCIENT RELIGIOUS INSTITUTIONS.

A brief account of the religious establishments kept up in this country before the Reformation, and of the officers which belonged to some of the largest of them, as well as of their different buildings and apartments, it is presumed, will not be uninteresting.

Under the general name of religious houses, are comprehended cathedral and collegiate churches, abbeys, priories, colleges, hospitals, preceptories, and friaries.

In *Conventual Cathedrals* the bishop was in the place of an abbot, and had the principal stall on the right hand of the entrance into the choir. Collegiate churches and colleges consisted of a number of secular canons, living together under the government of a dean, warden, provost, or master; and having for the more solemn performance of divine service, chaplains, singing men, and choristers belonging to them.

An *Abbey* was a society of religious people, having an abbot or abbess to preside over them. Some of these were so considerable that their abbots were called to Parliament, and had seats and votes in the House of Lords. They had the power and the authority of bishops within the limits of their several houses, gave the solemn benediction, conferred the lesser orders, wore mitres, sandals, &c., and carried crosses or pastorals in their hands; and some of their houses were exempted from the jurisdiction of the archbishop and bishop, and subject to the pope only. Their mitres differed a little from those of the bishops, who carried their crosiers in their left hands; but the abbots carried them in their right hands.

A *Priory* was a society of religious, where the chief person was termed a prior or prioress, and of these there were two sorts. First, when the prior was chief governor, as fully as any abbot in his abbey, and was chosen by the convent. Secondly, where the priory was a cell (or, as we would now call it, a chapel of ease), subordinate to some great abbey, and the prior was placed and displaced at the will of the abbot. But there was a considerable difference between some of these cells; for some were altogether subject to their respective abbeys, who sent them what officers and monks they pleased, and took their revenues into the common stock of the abbeys. But others consisted of a stated number of monks, who had a prior sent them from the abbey, and paid a pension yearly as an acknowledgment of their subjection, but acted in other matters as an independent body, and had the rest of their revenues for their own use. These priories or cells were always of the same order with the abbeys on whom they depended, though sometimes of a different sex. Some great abbeys built nunneries in some

of their manors, which should be priories to them, and subject to their visitation.

Priories Alien were cells to foreign monasteries; for when manors or tithes were given to foreign monasteries, the monks, either to increase their own rule, or perhaps rather to have faithful stewards of their revenues, built convenient houses for the reception of a small convent, and then sent over such a number as they thought proper, constituting priors over them. And there was the same difference in these cells as in the former; for some of them were conventual, and had priors of their own chusing; these were entire societies within themselves, and received the revenues belonging to their several houses for their own use and benefit, paying only the ancient apport, or what was at first the surplusage, to the foreign house. But others depended wholly upon the foreign houses; their priors were set over them; their monks were often foreigners, and removable at pleasure; and they returned all their revenues to the foreign head houses. These alien priories were most of them made by such as had foreign abbeys of their own, or some of their family's foundation.

Preceptories were manors or estates of the knights templars, where, erecting churches for the service of God, and convenient houses, they placed some of their fraternity under the government of one of those more eminent templars, who had been by the grand master created "præceptores templi," to take care of the lands and rents in that place and neighbourhood, and so were only cells to the principal house at London.

Commandries were the same among the knights hospitalers, as preceptories were among the templars, viz. societies of those knights placed upon some of their estates in the country, under the government of a commander, who were allowed proper maintenance out of the revenues under their care, and accounted for the remainder to the grand prior at London. Hospitals were such houses for the relief of poor and impotent people as were incorporated by royal patents, and made capable of gifts and grants in succession. In these there were generally two or three religious—one to be master or prior, and one or two to be chaplains and confessors. Hospitals were originally designed, in a great measure, for the relief and entertainment of travellers, and particularly of pilgrims.

In every abbey the chief officer was the abbot or abbess, who presided in great pomp; was generally called lord abbot or lady abbess; and had a kitchen and other offices distinct from the common ones of the society. In every priory the chief officer was the prior or prioress, who had the same power in priories as abbots and abbesses had in abbeys, but lived in a less splendid and expensive manner, though in some of the greater houses they were called lord prior and lady prioress. Next under the abbot in every abbey, was the prior, who in the abbot's absence had the chief care of the house; and under him was the subprior, and in great abbeys, the third, fourth, and even fifth prior, who had their respective shares in the government of the monks, &c., and were removable at the will of the abbot, as all the other officers were. In every priory, next under the prior, was the subprior, who assisted the prior whilst present, and acted in his stead when absent.

In rich monasteries there were a variety of officers whose respective duties were most exactly defined. 1. Magister operis, or master of the fabric, who probably looked after the buildings, and took care to keep them in good repair. 2. Eleemosynarius, or the almoner, who superintended the alms of the house (which were every day distributed at the gate to the poor), who divided the alms upon the founder's day, and at other obits and anniversaries, and in some places provided for the maintenance and education of the choristers. 3. Pitantiarius, who had the care of the pittances, which were allowances upon particular occasions over and above the common provisions. 4. Sacrista, or the sexton, who took care of the vessels, books, and vestments belonging to the church, looked after and accounted for the oblations at the great altar, and other altars and images in the church, and such legacies as were given either to the fabric or for utensils: he likewise provided bread and wine for the sacrament, and superintended the funerals. 5. Camerarius, or the chamberlain, who had the chief care of the dormitory, and provided beds, bedding, and clothing for the monks. 6. Cellararius, or the cellarer, who procured provisions for the monks, and for strangers resorting to the convent, viz. all sorts of flesh, fish, fowl, wine, bread-corn, malt for their ale and beer, oatmeal, salt, &c., as likewise wood for firing, and all utensils for the kitchen. 7. Thesaurarius, or the treasurer or bursar, who received all the common rents and revenues of the monastery, and paid all the common expenses. 8. Precentor, or the chaunter, who had the chief care of the choir service, and not only presided over the singing men, organist, and choristers, but provided books for them, paid them their salaries, and repaired the organs: he had also the custody of the seal, and kept the Liber Diurnalis, or Chapter Book, and provided parchment and ink for the writers, and colours for the limners of books for the library. 9. Hostilarius, or hospitilarius, whose business it was to see strangers well entertained, and to provide firing, napkins, towels, and such like necessaries for them. 10. Infirmarius, who had the care of the infirmary, and of the sick monks who were carried thither. 11. Refectionarius, who looked after the hall, provided tablecloths, napkins, towels, dishes, plates, spoons, and all other necessaries for it, even servants to wait there: he likewise kept the cups, salts, ewers, and all the other silver utensils belonging to the house, except the church plate.

These were the principal officers who were monks. There were others of inferior note, beside lay officers and servants.

Among the different buildings and apartments may be reckoned, 1 The gate-house, where the porter resided. 2. The refectorium, or common hall, where the monks dined together, and where, on great solemnities, the abbot honoured them with his presence. 3. The locutorium, or parlour. 4. The oriolium, or the oriol, so called from its bay or projecting window. "The use hereof," says Fuller, "is known for monks, who are in latitudine morbi, rather distempered than diseased, to dine therein, it being cruelty to thrust such into the infirmary, where they might have died with the conceit of the sickness of others." 5. The dormitorium, or dormitory, in which were placed their beds. 6. The lavatorium, or laundry, where their clothes were washed, and where they washed at the conduit. 7. In every great abbey there was a large room called the scriptorium, where several writers made it their whole business to transcribe books for the use of the library. They sometimes, indeed, wrote the leiger books of the house, and the missals, and other books used in divine service; but they were generally employed on other works, viz. the Fathers, Classics, Histories, &c. John Whethamstead, abbot of St Alban's, caused above eighty books to be transcribed during his abbacy. Fifty-eight were transcribed by the care of one abbot of Glastonbury; and so zealous were the monks in general for this work, that they often got lands given, and churches appropriated for carrying it on. 8. The library, which in most of the great monasteries was furnished with a variety of choice manuscripts. 9. "All is marred," says Fuller, "if the kitchin be omitted, so essential a requisite, with the larder and pantry, the necessa y suburbs thereof."

In a conventual, or abbey church, we find, 1. The cloisters, or the place for burial, and in which the monks walked and studied. 2. Navis ecclesiæ, the nave or body of the church. 3. The rood-loft, which contained the crucifix and the music. 4. Gradatorium, a space containing the ascent out of the nave into the choir. 5. Presbyterium, or the choir, on the right side of which was the abbot's stall, and that of the prior on the left: the monks were on each side, and chaunted the service alternately. 6. Vestiarium, the vestry, where their copes, &c. were deposited. 7. Vaulta, or vault, being an arched room over part of the church, which in some abbeys was used to enlarge their dormitory, where the monks had beds for their repose. 8. Concameratio, being an arched room between the east end of the church and the high altar.

The remaining rooms of a monastery stood at a distance from the main structure. Such as, 1, The eleemosynaria, or almonry, where they maintained the poor. 2. The sanctuary, where debtors and malefactors obtained refuge. 3. The infirmary, in which the sick were attended. 4. At a distance from these stood the stables, over which the stallarius, or the master of the horse, presided; and under him the provendarius, who, as his name imports, provided provender for the horses. These were divided into four ranks.—1. Manni, being geldings for the saddle of the larger size. 2. Runcini, runts, small padnags. 3. Summarii, sumpter-horses. 4. Averii, cart or plough-horses. Besides the fore-mentioned buildings, there was a prison for incorrigible monks. The abbot had *tetrum et fortem carcerem*, a strong and hideous prison, where their obstinacy was corrected into reformation.

They were obliged to attend service in the church, or chapel, seven times within the four-and-twenty hours. The services were arranged in the following manner:—1. At cock-crowing, or the *nocturnal*: this service was performed at two o'clock in the morning. 2. The *matins*: these were at the first hour, or, according to our computation, at six o'clock. 3. The *tierce*, at nine o'clock. 4. The *sext*, at twelve o'clock at noon. 5. The *none*, at three in the afternoon. 6. The *vespers*, at six in the afternoon. 7. The *compline*, soon after seven. The monks were always to walk two together; this was to guard their conduct, and furnish them with a witness to defend their behaviour. From Easter to Whitsuntide, they dined at twelve, and supped at six. In this interval they observed no fasts. At other times they were bound to fast till three o'clock, on Wednesdays and Fridays. The twelve days in Christmas were excepted in this canon. Every day in Lent they were enjoined to fast till six in the evening. They were not allowed to talk in the refectory at meals; they were likewise to attend to the Scriptures read to them at that time. The *septimarians* were to dine by themselves after the rest: these *septimarians* were so called because their office continued but a week, such as the reader, waiters, cooks, &c. The superior was never to dine alone: when there were no strangers, he was to invite some of the brothers to his table.

AMBITION WORSE THAN SLAVERY.

The slave has only one master: the ambitious has of them as many as there are persons useful to his fortune.—*La Bruyère.*

MOCK SHAVING AT OXFORD.

At Oxford there formerly prevailed a very curious custom, namely, a mock ceremony of shaving on the night preceding magistration. At a visitation of Oriel College, in 1531, by Longland, Bishop of Lincoln, he ordered one of the fellows, a priest, to abstain, under pain of expulsion, from wearing a beard and pinked (yellow) shoes, like a laic, and not to take the liberty, for the future, of insulting and ridiculing the governor and fellows of the society. About the eleventh century, and long before, beards were looked upon by the clergy as a secular vanity, and, accordingly, were worn by the laity only. Yet in England this distinction seems to have been more rigidly observed than in France. Malmesbury says that King Harold sent spies into Duke William's camp, who reported that most of the French army were priests, because their faces were shaved. This regulation remained among the English clergy at least till the time of Henry the Eighth. Among the religious, the templars were permitted to wear long beards. —There was a species of masquerade celebrated by the ecclesiastics in France, called the Show of Beards, entirely consisting of the most formidable beards. Gregory of Tours says, that the abbess of Poictou was accused of suffering one of these shows, called a Barbatoria, to be performed in her monastery.—Hearne endeavours to explain an injunction in the statutes of New College, against a mock ceremony of shaving on the night preceding the solemn act of magistration, by supposing that it was made in opposition to the Wickliffites, who disregarded the laws of Scripture, and in this particular instance violated the following text in Leviticus xix. 27., where this custom is expressly forbidden: "Neither shalt thou mar the corners of thy beard." Nothing, says Warton, can be more unfortunate than this elucidation of our antiquary. The direct contrary was the case; for the Wickliffites entirely grounded their ideas of reformation, both in morals and doctrine, on Scriptural proofs, and often committed absurdities in too precise and literal an acceptation of texts. It is styled Ludus, a play, and is to be ranked among the other ecclesiastic mummeries of that age; for one of the pieces of humour in the celebration of the *fete des foux*, in which they had a bishop, an abbot, and a precentor, of the fools, was to shave the precentor in public, on a stage erected at the west door of the church.

BEAUTIFUL THOUGHT.

St Monica, drawing near her death, sent most pious thoughts as harbingers to heaven, and her soul saw a glimpse of happiness through the chinks of her sickness-broken body.—*Fuller.*——Waller has versified this in the well-known lines:—

The soul's dark cottage, battered and decayed,
Lets in new light, through chinks which time has made.

A WISH-BURST.*

O, to bound o'er the bonnie blue sea,
With winds and waves for guides;
From all the wants of nature free,
And all her ties besides!
Beyond where footstep ever trode
Would I hold my onward way,
As wild as the waves on which I rode,
And fearless, too, as they.

The angry winds, with lengthened sweep,
Were music to mine ear;
I'd mark the gulfs of the yawning deep,
Close round me, without fear.
When winter storms burst from the cloud,
And trouble the ocean's breast,
I'd joy me in their roaring loud,
And 'mid their war find rest.

By islands fair in the ocean placed,
With waves all murmuring round,
My wayward course should still be traced,
And still no home be found.
When calm and peaceful sleeps the tide,
And men look out to sea,
My bark in silence by should glide,
Their wonder and awe to be.

When sultry summer suns prevail,
And beet† on the parching land,
The cool sea-breeze would I inhale,
O'er the ocean breathing bland.
A restless sprite that like delight
In calm and tempest found,
'Twere joy to me o'er the bonnie blue sea,
For ever and aye to bound!

* We have taken the liberty of thus naming the above spirited little poem, which first appeared uncntitled, and with the signature "R. H." in a periodical work called "The Rainbow," which was commenced at Edinburgh in 1821, and, though conducted with considerable talent, perished at the 12th number.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 75. SATURDAY, JULY 6, 1833. PRICE THREE HALFPENCE.

HINTS TO TALKERS.

"Aye free aff hand your story tell."—BURNS.

IT is of no small importance to one who has to push his way in the world, that he should be able to express himself, on all occasions, in so ready and brief a manner, as to run no risk of tiring the individuals upon whom he may be more or less dependent for the means of his advancement. There is unfortunately some difficulty in attaining a proper medium between a fluency of speech, which is apt to lead to an excessive and tiresome copiousness, and that languor and difficulty of expression, which equally tires, without giving nearly the same quantity of talk. The former fault is more generally an accompaniment of youth than of age, while the latter is most frequently found in old people. All such peculiarities are no doubt in a great measure involuntary, as being intimately dependent on the talents and character of individuals; yet that they are susceptible of correction, and may be partly avoided, if we are on our guard against them, is also very certain.

An undue loquacity most frequently arises from a precipitancy of temper, and from being too full of one's self. If persons afflicted from the former source were to check themselves into a sobriety of ideas, and cast about a little before speaking, for the most straightforward and simply demonstrative phraseology, wherein to express what they had to say, they would soon cure themselves: if those who err from vanity could only contrive, under beneficial advice, to pump a little of themselves *out of themselves*—if they would only be so good as observe that others have ideas to express, and perhaps a little desire of showing them off, as well as they—they would also, we have no doubt, speedily lessen their malady. But, upon the whole, there is less annoyance experienced from this source than from the tedious twaddle, as it is called, of the duller kind of intellects; and a cure in the latter case is much more desperate. Yet there would be much less tiresome talk, and also less tiresome writing, if a few things were guarded against. A great deal, as every adroit talker and every experienced writer knows, lies in fixing an interest at the beginning: only take care not to alarm at the offset by the prospect of a long story, and you may afterwards continue to speak or scribble as long, almost, as you choose. Every one may have remarked how distressing it is in church to hear the preacher lay out his discourse into heads—so much to be said on this point, so much on that—next, an application of the whole, and, finally, a few words (that is, as many as can be spoken in ten minutes) of exhortation. The idea of so many distinct parts in the composition causes it to look wearifully long from the very first, so that many lukewarm persons, who might otherwise have listened and caught some flying edification, think of nothing but how—in what posture—by what every-day subject of reflection within themselves—they may most easily pass the time. Neither preacher nor writer should ever say that he has any thing to say at all: he should begin with the subject itself, and never stop till it is exhausted. Two hours of attention may thus be obtained from many, who, if informed at the beginning that one was to be required for the purpose, would have refused to listen for a minute. So thoroughly does this hold good, that we have found ourselves deterred from proceeding with a story, on a shift taking place in the person of the narrator, or a distinct paper or document being introduced. A reader, indeed, should never know but that the article he is reading may end on the next page: the author is never sure of him till after he has been inveigled half way on.

The slow garrulity of old age, even to those who are most disposed to reverence grey hairs, is sometimes dreadful. For a young and busy man of quick ideas to find himself suddenly arrested by a venerable friend, who has some trifling but intricate piece of business to transact, or some document to read, or some long and personal story to tell, is one of the most striking distresses that can arise in the wide amphitheatre of human misery. The very unpacking of the spectacles is enough to make one sink and die. First, there is the important face, primming itself for the developement of some superficial, but to it most mysterious and important circumstance. Then the hand is put into the pocket, and—not the spectacles, but the spectacle-*case*, drawn forth. The clasp is deliberately undone; the spectacles pulled out. You think the optical instrument is to be immediately put on. Not at all. It is laid down on the table, till the clasp is done again, and the case returned to the pocket. Then the spectacles are taken up—then a handkerchief is taken out to wipe them—then the process of wiping is carefully and slowly gone through—then the handkerchief is returned—and, finally—Oh protracted misery!—they are raised to the nose, where they are, perhaps, fully adjusted, about ten minutes after being drawn from the pocket; that is to say, if they have not been delayed much longer in consequence of a fresh burst of preliminary explanation and preparatory fiddle-faddle. Oh, if these respectable old gentlemen would but consider how much unfledged youth has to do before he be equally well feathered with themselves—how fast his intellect naturally runs—how irksome to be thus chained to the dray, when he would like to bound forward with the chariot—they would be heart-smitten with their cruelty, and from pity correct a fault to which every other kind of cure might be applied in vain.

I was once walking along one of the long and empty streets in the west end of London, along with a young friend, who, like myself, generally resided in Edinburgh, but was now just returned from an extensive tour in the United States of America. Suddenly, my companion started, and seemed greatly alarmed, saying, hurriedly, "For God's sake, let us go down this side street!" I accompanied him in the direction he indicated, though I could see nothing in front to alarm him, nor indeed any object at all, except a well-dressed middle-aged looking man, who was advancing from the opposite direction, and was still at a considerable distance. When we had reached a place of safety, as my friend called it, he gave the explanation, which he saw from my looks was required. "That gentleman," said he, "whom we were just now about to meet, is a valetudinarian whom I had the misfortune to encounter in a coffee-house when I was last in London. I do not think he is really very ill: only, like the most of Englishmen, he has perhaps been all his life in the habit of every now and then taking what they call a little medicine, and may have thus, perhaps, made himself ill in spite of himself. However, having fallen into conversation with the old gentleman one evening in the public room at our hotel, he began to give me such a recital of his many and complicated disorders, and of his various attempts to get quit of them, as made me almost as ill as he represented himself to be. I tried many expedients to cut him short, but was at length fairly obliged to take refuge in my bed-room. Nothing else would do. Now, the man would not perhaps be so very tiresome as he is, if it depended solely on what he has to say. But besides the tedium of his endless recital of clinical miseries, there is an unhappy dullness in his very voice, which proves by far the severest part of the affliction. If a sloth, for instance, were a beast of prey, which fastened upon you as a spider does upon a fly, and if it emitted a humming self-satisfied sound while sucking your blood, like a schoolboy at his bread and butter, your circumstances and sensations would, I dare say, exactly resemble mine when this man was pouring his prosey stream into my ears. I positively had to go to the opera next night, in order to restore my nerves to their wonted tone. Before that time, however, you may be sure I had taken care to shift my quarters, to prevent the possibility of falling in with the same man again. I did not see him any more, sir, till about a twelvemonth after, when, in turning the corner of a street in New York, I met him full in the face, and, of course, fell plump into his toils. After the slightest possible recognition, 'Oh, by the way,' said he, laying, at the same time, a finger like a grappling-iron aboard of my button-hole, 'as I was saying when I saw you last, I got no good of Lignum's scorbutic drops. All stuff, sir. The irritation continued as bad as ever'—and so on he went, with his monotonous gummy voice, as if the time and space that intervened since our last rencounter had been as nothing in his estimation. Why, sir, there is a particular jest in Joe Miller, which I always used to think highly improbable, though certainly very droll. A gentleman, riding along a bridge one day, turned about to his servant, and asked if he liked eggs, to which, saith the chronicler, John answered 'Yes.' 'How?' said the gentleman exactly that day twelvemonth, at the same hour, when passing along the same bridge. 'Poached, sir,' replied the man, without a moment's hesitation. I always used to think this a mere fiction; but now, I saw that such an incident might be quite real. There is nothing, sir, on earth like the perseverance of a regular twaddler in the line of his vocation. You may break him off if you will, or if you can; but till you have fairly heard him out, he will never think himself quits with you—he still holds himself in readiness, at whatever part of the world or whatever period of future life he meets you again, to resume the thread of his discourse.

"I listened, sir, for half an hour to the leaden narrative, which still seemed as far from the conclusion as ever. Many an effort I made to give the affair a turn—to throw in a jest, and escape under its cover—but no: every struggle I made served but to fix his finger the more nervously in my cloth. I had no consolation but the apathy of despair, and that I could not resign myself to. However, as good luck would have it, a procession came suddenly upon us, preceded by a band of music, and followed by a sweeping crowd of boys. We were for half a minute drifted along together, he still clinging furiously to the breast of my coat; but at length he parted from me, and, to my infinite satisfaction, I saw him borne away in a contrary direction from myself—still turning, however, towards me an eager and anxious look, as if he were like to burst with suppressed information respecting the efficacy of Morrison's universal medicines.

"Sir, I met my tormentor once more; but it was on the tops of different stage-coaches, which were passing each other upon the road. He recognised me just as we shot athwart each other: his dull eye kindled, he threw forward his heavy head as if to speak, and instinctively put forth his finger to catch hold of my button. I was safe, however, for this time. We were rapidly taken out of each other's sight. I could only guess, by his look, as he loomed away into the distance, how distressed he was at being still obliged to postpone what he had to say about the medical preparations which he was beginning to discuss in New York. Since then, I have not once

met him till this day; and you may conceive, from what I have told you, how much reason I had to be alarmed at his approach, how much reason to be delighted at my good fortune in eluding him. This pleasure, however, is only temporary. I am destined, I see, to hear out his story: go where I like, it will come upon me somewhere. All I can do is to put off the evil day as long as I can."

If there be any spark of humane feeling in the twaddlers, they will surely be impressed by this striking anecdote of the misery inflicted by one of their fraternity, and will exert themselves as much as possible to correct their fault. Just let every man make a resolution never to speak above fifteen seconds at a time about himself, or any thing that is his, and he will never be otherwise than an agreeable member of the community. There is a respectability in suffering which disposes every man to listen for a while, with decent attention, to the narratives which sick people are always so ready to give to their friends. But this good and kind feeling should not be abused: there is a limit to our sympathies, beyond which all is hypocrisy; and it would be well if the afflicted would join a just calculation of this extent of general compassion, with their own sense of the importance of their distresses, when they begin to talk upon the subject. If there be this limit to our interest in the sick, how much narrower are the bounds of that which we are naturally inclined to take in the personal affairs and little vanities of able-bodied men! We should, if we really esteem ourselves, be far above all miserable attempts to set ourselves off before a neighbour, by boring him, as he will call it, with our concerns, when he has enough to attend to of his own.

POPULAR INFORMATION ON SCIENCE.

LUMINOUS METEORS.

In the articles which we have already published in the Journal, under the title of "Popular Information on Science," we have considered at some length the aqueous meteors which are observable in nature. Clouds, hail, rain, snow, mist, dew, &c. have successively claimed our attention, and perhaps we have succeeded in showing, that, while each of these agents is in itself an interesting subject of contemplation, each in its turn tends to promote the well-being of the animate creation. Another class of meteors now invites our inquiry, which we apprehend will be equally attractive to those who love to survey the beauties of the surrounding world. We allude to luminous meteors, among which are included the rainbow, the aurora borealis, halos, falling stars, St Elme's fire, mock suns, and images reflected upon the clouds, making a species of phantasmagoria, which cannot fail to excite wonder and admiration. The aqueous meteors we necessarily viewed principally in their relations to the earth; the luminous meteors may be viewed more in connection with the heavens; and who will not pause to behold with a feeling of reverential awe the "eternal lights that live on the sky?"

THE RAINBOW.

This beautiful arch of many colours attracted the attention of mankind in the earliest ages. In the mythology of the ancients it was deified in the person of Iris, who was represented with wings variegated with all its lovely hues, and supposed to be the favourite messenger of the gods.

> "On equal wings she poised her weight,
> And formed a radiant rainbow in her flight."

This Iris was worshipped both by the Greeks and Romans. We learn, also, that the rainbow was worshipped by the Peruvians when the Spaniards arrived in South America. The Romans assigned to it a very fanciful use: they imagined that it drew up the waters from the earth to the heavens. Hence Ovid observes—

> 'Nuncia Junonis varios induta colores
> Concipit Iris aquas, alimentaque nubibus adfert."

The cause of the variety of colours exhibited by the rainbow, was not understood until Sir Isaac Newton had demonstrated the composition of light. In the Scripture, after that God had spoken of the rainbow as a covenant between heaven and earth, we read that he said, "It shall come to pass that when I bring a cloud over the earth, that the bow shall be seen in the cloud." It is now known that a single white solar beam consists of several different coloured rays, which, combined together, produce the white light. According to Sir Isaac Newton's discovery, there are seven primary rays, of the following colours: red, orange, yellow, green, blue, indigo, violet. But recently Sir David Brewster—whose name is an honour to his country—has shown that four of these seven coloured rays are compounded of the three others. Thus the intermixture of the red and yellow rays produces the orange-coloured ray—the combination of the yellow and blue produces the intermediate green—and the combination of the red with the blue produces the indigo and violet rays. Properly speaking, therefore, there are only three primary rays in a sunbeam—the red, yellow, and blue; and these, by certain degrees of intermixture, produce the seven distinct colours referred to by Sir Isaac Newton. We have elsewhere shown that a cloud consists of a vast number of watery globules, which float together in the regions of the atmosphere. When such a cloud opposite the sun is falling in rain, the spectator, having his back turned to the sun, beholds a reflected arch of light of many hues; for the white rays of light, having been decomposed by the watery globules, exhibit these varied colours. Sometimes, instead of forming a complete semicircle, spanning the azure vault, only a part, or segment, of the arch appears. Not unfrequently two rainbows are seen at the same time, and as many as six, seven, and even eight, have been simultaneously observed. A magnificent phenomenon of this description was seen by the Rev. William Scoresby, at Bridlington Quay, at 5 P. M., on the 12th August 1826, during a brilliant sunshine, and a heavy partial shower that passed across from the north to the south-eastern part of the town. Both the first and second bows were complete arches, descending to the ground on the left, and to the surface of the sea on the right hand. The colours were of extraordinary brilliancy. Within the arch of the first bow were no less than three, if not four supernumerary bows, in close and regular order, progressively diminishing in intensity, so that the last was scarcely discernible. The first bow consisted of the ordinary colours reckoned from the outside, viz. red, orange, yellow, green, blue, indigo, and violet. Immediately in contact with the interior violet succeeded the supernumerary stripes of different colours, consisting most obviously of green and purple, or violet, in regular succession, and the whole gave the impression of one continuous and splendid canopy receding from the effects of distance into indistinctness. Occasionally from the reflection of the rays from the surface of the sea, rainbows have appeared in an inverted position, or, as it were, turned upside down; but such a phenomenon as this is of very rare occurrence. The reflection of the sun's light on the watery particles constituting a fog, has likewise been known to produce a rainbow, or, as it might with greater propriety be termed, a fogbow. The academicians, Bouguer, Godin, and La Condamine, when standing on the very elevated mountain of Pambamarca, in Quito, saw their own images reflected in a very light fog, and surrounded by several concentric circles, ornamented with the colours of the rainbow. The intense fogs which prevail in the polar regions at certain seasons, occasionally rest upon the surface of the water, and reach only to an inconsiderable height. At such times, although objects situated on the water can scarcely be observed at the distance of one hundred yards, yet the sun will be visible and effulgent. "Under such circumstances (says Captain Scoresby), on the 19th July 1813, being at the topmast-head, I observed a beautiful circle of about 30° in diameter, with bands of vivid colours depicted on the fog. The centre of the circle was in a line drawn from the sun, through the point of vision, until it met the visible vapour in a situation exactly opposite the sun. The lower part of the circle descended beneath my feet to the side of the ship; and although it could not be a hundred feet from the eye, it was perfect, and the colours were distinct. The centre of the coloured circle was distinguished by my own shadow, the head of which, enveloped by a halo, was most conspicuously pourtrayed. The halo, or glory, was evidently impressed on the fog; but the figure appeared to be a shadow on the water, the different parts of which became obscure in proportion to their remoteness from the head, so that the lower extremities were not perceptible. I remained a long time contemplating the beautiful phenomenon before me. Notwithstanding the sun was brilliant and warm, the fog was uncommonly dense beneath. The sea and ice, within sixty yards of the ship, could scarcely be distinguished. The prospect thus circumscribed served to fix the attention more closely on the only interesting object in sight, whose radiance and harmony of colouring, added to the singular appearance of my own image, were productive of sensations of admiration and delight."†

Rainbows are occasionally produced by the moon's rays being in like manner reflected and refracted from a falling cloud; but such rainbows are not of very frequent occurrence, and the arch they form is generally very pale and indistinct.

The rays of the sun falling on the spray of billows, or on the vapours of vast cataracts, produce frequently the appearance of rainbows. This, amidst all its terrors and sublimity, throws a kind of fearful beauty over the waters of Niagara. It is also often observed over the Alpine torrents; nor can we more appropriately conclude this sketch, than by subjoining the description of the iris or rainbow seen by Lord Byron, who, in contemplating the "roar of waters from the headlong height," and the "flashing mass" foaming amidst the rocks beneath, exclaims—

> "Horribly beautiful! but on the verge,
> From side to side, beneath the glittering morn,
> An Iris, amidst the infernal surge,
> Like Hope upon a deathbed, and unworn;
> Its steady dyes, while all around is torn
> By the distracted waters, bear serene
> Its brilliant hues with all their beams unshorn,
> Resembling, 'mid the torture of the scene,
> Love watching madness with unalterable mien."

† An Account of the Arctic Regions, by W. Scoresby Vol. i., 394.

A PASSAGE IN THE HISTORY OF SOUTH AMERICAN INDEPENDENCE.

The history of the war of independence in the western states of South America is interspersed with numerous instances of remarkable adventure. Desultory in its nature, and unconnected in its details, that war was peculiarly fitted to call into activity the latent energies of those who participated in its perils; and the spirit of bold enterprise to which it gave rise was shared no less by those who fared on the sea, than by the scattered guerilla parties on the continent. The banner of freedom, indeed, had hardly been raised on the towers of Valparaiso, when numerous bands of hardy seamen fitted out their barks for predatory adventure; and privateers, in particular, received both encouragement and assistance from the insurgent government, whose policy it was to weaken, by every possible means, the maritime power of the mother country. Foreigners, as well as Americans, eagerly embarked in the business of legalised plunder, not from any principle of patriotism, it is obvious, but upon mere mercenary speculation. British sailors, more than those of any other country, were enamoured of the exploits which such a field of enterprise presented for their achievement, and many of them left their peaceful London and Liverpool traders to share, if not in the honours, at least in the anticipated profit and pleasure of a course, perhaps a life, of perpetual hostility.

Previous to the arrival of Lord Cochrane's fleet on the coast of Chili, privateering was nearly at its height in the South American seas, and it is to that period, namely, to 1818, that the following isolated passage of history belongs.

Soon after Valparaiso had fallen into the hands of the revolutionary forces, a few British seamen resolved to set up as privateers on the Chilian and Peruvian coasts. With this view, having, in the first instance, procured the governor's licence, they purchased an old West Indian drugger-boat,* as sorry looking a craft as ever ventured a league to sea, but the small stock of dollars which they had succeeded in scraping together, did not enable them to purchase one better fitted for their purpose. Having taken a few additional hands into partnership, they soon put a deck upon her, and otherwise rigged her out in pretty tolerable style. They next collected a quantity of old arms, consisting of muskets, pistols, cutlasses, boarding-pikes, and two small swivels, which they mounted on the boat's timber-heads; but as they were to trust chiefly to boarding, they took on board no cannon—their bark, indeed, was, from its diminutive size, utterly unfit for this grand instrument of war. Altogether, their outfit and the object of it seemed somewhat of a burlesque upon ordinary privateering; but they were good-humoured fellows, fond of a joke, and their own masters, so they did not mind the mirth and harmless ridicule which their armament excited.

Thus equipped, and having stowed on board a few bales of dry jerk beef, with some other necessary articles of provision, they put to sea, determined to make the most of every thing they should meet with. The crew consisted of sixteen hands, commanded by one Mackay, a Scotsman, who had a short time before resigned the office of steward in a South-Sea whaler, and who had originally projected this mad-like scheme. They had only one course to follow; for the trade-wind which blows for a considerable part of the year constantly from the south, carried them briskly up the wide coast of Peru. On their voyage, which was extended to a considerable distance beyond Lima, they had not the good fortune to fall in with a single legitimate prize; but running short of provisions, they were soon forced to put under contribution such trading vessels and boats as they happened to fall in with. Supporting themselves entirely by compulsory levies, it was not long before they lost all proper sense of a distinction between plundering and privateering; but the plea of necessity was always at hand to satisfy their not over-scrupulous consciences, that in employing such means to supply their wants, they did nothing morally wrong—or at least that, circumstanced as they were, their doings amounted, at the utmost, to justifiable marauding. Their acts of depredation became so frequent, however, and in some instances of so aggravated a character, that they soon excited alarm throughout the whole coast. Even at Lima they were heard of. At one period, indeed, it was seriously intended by the authorities there, to dispatch a small force to consign the drugger and her pilfering crew to the bottom of the ocean; but they were saved the trouble of carrying their threat into execution. The offenders soon brought on their own apparent ruin; for, dreaded by friends no less than by foes, they were in a few weeks shunned and run from by every bark that hove in sight. Smugglers, as well as people of their own calling, refused not only

* A drugger, or drogger-boat, is a vessel similar to a lighter in this country.

to relieve their wants, but to hold any intercourse with them; and they were at the same time denied all communication with the peaceable citizens on shore. Thus situated, both their provisions and water were speedily exhausted, and, to add to their distress, their little vessel became leaky to such a degree that she was almost wholly unfit for sea, while they were themselves worn out with the constant exertion which was necessary to keep her afloat.

They were, therefore, compelled to turn towards Valparaiso; but, under the difficulties they had to encounter, the attempt to reach that port was almost a hopeless one. The wind brew right a-head, while they had neither provisions, nor were they in a situation in other respects to venture upwards of a hundred miles from land, in order to fall under the north trade-wind. In these painful circumstances, and not daring to touch at any of the intermediate ports, there was no alternative but to sweep* back to Valparaiso. They were not without some apprehension, too, that Spanish frigates might be cruizing on the coast, into whose hands they knew it would be certain destruction to fall. No wonder, therefore, that their spirits flagged a little, and that they now crept along the coast with a degree of caution that contrasted strikingly with their former reckless disregard of all danger. It was only during the night, indeed, that they coasted along; during the day they skulked in close to the land, concealing themselves in unfrequented creeks and among the rocks, where they employed themselves in fishing, now the only means by which they obtained a subsistence.

While thus fighting their way against fortune and the winds, they chanced to fall in with an Indian fisherman, whom they made prisoner, with the view of procuring from him information respecting the state of the coast; and they had an eye also to his fishing apparatus, as well as to the benefit of his superior skill in the art of using it, for by this time they were sorely pressed by the common wants of our nature. By the Indian they were informed that the coast was clear of king's ships—that an armed merchantman from Old Spain had arrived at Arica (a fortified town still in the hands of the royalists) a few days before, and that she was lying under the protection of the fort, ready to discharge a valuable cargo. Their disappointment at having missed the opportunity of falling in with so rich a prize, in consequence of useless, and in other respects hurtful delays, was extreme, for they entertained no doubt whatever, that, had they been down in time, as they would have been but for these delays, the Minerva would have been the reward of all their privations. Disappointment is not a feeling that arises in the mind, and then instantaneously passes away; it recurs again and again, to vex the spirit, and to rouse its energies to redeem the mistaken or neglected step by which it has been troubled. With the crew of the drugger-boat it operated with instantaneous effect, and they were at the same time stimulated, by the severe pressure of existing necessities, to form the desperate resolution of attempting the capture of the Minerva. But then, on farther interrogation, the Indian added, that besides being armed with five and twenty guns, and lying, as the vessel did, within musket shot of a strong battery, she had received on board, in addition to a numerous crew, upwards of 250 Spanish soldiers, for the especial purpose of protecting her from any piratical or predal attack. These were difficulties which, to the ordinary run of mortals, would have been considered as absolutely insurmountable; but, by the handful of famishing tars, they were viewed in no such light. The crew of the Minerva did not enter into their calculation at all; for, once on board, with cutlass in hand, they would speedily be overcome; and the fort, though strong enough to blow them out of the water in five minutes, would not surely (so they reasoned among themselves) be so regardless of Spanish life and Spanish property, as to sink the Minerva in order to destroy a few impertinent marauders already on board of her. The formidable guard of soldiers could not, however, be so conveniently disposed of. To attempt a fair stand-up fight with a force numerically so far superior, would be to court certain destruction. It therefore appeared to them that the only means by which the difficulty might, by possibility, be obviated, was to board the vessel by surprise at midnight, and to secure her hatches—a plan sufficiently simple in itself, and effectual too, provided it could be promptly accomplished. A council of war, consisting of all hands, having been held, the scheme underwent solemn, but by no means deliberate discussion, and was pronounced *quite practicable!!* This point finally settled to every one's entire satisfaction, and evening coming on, they stole out from among the rocks where they had been concealed during the day, and hove warily down towards the mouth of the semicircular bay, in the innermost verge of which stands the beautiful town of Arica. Before day-break they again betook themselves to a hiding place, close on shore, some eight or ten miles distant from Arica; and, ere the sun had been an hour above the horizon, each in his turn had slipped out in the Indian's canoe to enjoy a stolen peep at the expected prize. Their arms and ammunition were now carefully overhauled. Every pistol received a fresh flint, and its lock a touch of oil. A sufficient quantity of powder was spread out on an old top-sail to dry in the sun; and, while engaged in settling the details of the assault, they employed their hands in giving their rusty cutlasses the keen edge of a razor. All this day a little putrid water was their only refreshment, for they had not had leisure to attempt the capture of a single fish; but their mental anxiety was sufficiently intense to absorb all consciousness of physical wants.

The poor Indian fisherman was kept as much as possible in the dark as to the important part that was to be assigned to him in the affair. He happened to be the only one on board who could speak Spanish with sufficient fluency to escape instant detection; and, in the event of being challenged by the Minerva's sentinels, he was instructed to say that they were the bearers of dispatches for the captain from the commander of the Spanish fleet.

Towards evening the wind died away into a dead calm, and the moon rose with just as much light as sufficed to render objects close at hand sufficiently distinguishable, while there was not enough of it to expose to view those at a distance. Thus favoured, the sixteen lion-hearted British seamen left their lurking place, and stole into the bay towards the Minerva. About midnight the dull light of a lantern on board became visible, and in a few minutes afterwards the dim outline of the vessel's hull was discovered. For a moment the drugger's oars were suspended to allow her crew to draw one deep breath before striking the desperate blow. During this pause, each man ascertained that his brace of pistols was in his belt, and his cutlass and boarding-pike at hand. Their courage required no "screwing up," for in one and all of them it naturally remained, at all times, above the "sticking point;" but at this moment of suspense, it may easily be conceived that their breasts were swelled with a tumult of distracting emotion, and with that burning solicitude which is produced, even in the breasts of the bravest, by the consciousness that the moment has arrived when nought remains but to do or die. Agitated but not confused by these feelings, the drugger's crew rowed fearlessly forward upon the Minerva's larboard side. All was quiet, until they reached within musket shot of the ship; it was then that the night-watch sung out a challenge. "Dispatches from the fleet for the captain," was the fisherman's answer. "Keep off—the captain is on shore," replied the sentry. "Pull on pull on, ye devils," whispered Mackay. "Stand off, you there, or I'll sink you, by Saint Maria," reiterated the sentry; and the threat having been disregarded, he fired his musket into the boat, but without effect. "Slap alongside, my lads," cried Tom Martin; "keep clear o' her *stinsails*." But Tom's warning was too late; for at this most critical moment the drugger's mast and cordage ran foul of the Minerva's swinging-boom, which, as is usual in large ships, had been rigged out for the purpose of mooring the boats, and a considerable swell causing the Minerva to roll heavily, the difficulty of boarding even without resistance was, in the situation in which they were now placed, rendered almost insurmountable. Not a moment, however, was lost. Martin, firing a pistol among a knot of Spaniards, who had suddenly collected on the gangway, seized hold of the Minerva's "quis work," and mounting the swinging-boom, was instantly on board. He was speedily followed by several of his shipmates, who, without uttering a word, commenced an almost unresisted attack on the astonished Spaniards. Meanwhile the drugger had been swung round by the swell, till she came right alongside of the Minerva, and the remainder of the assailants easily scrambled on deck. The conflict was bloody, but of brief duration, for so instantaneous had been the assault, and panic-struck as the Spaniards were by its temerity, they made little or no resistance; and their unexpected visitors experienced little difficulty in driving those who had escaped with life down the hatchway. The only man amongst them, indeed, who defended himself with true courage, was the Minerva's boatswain. This brave fellow, who encountered Mackay, placed his back against the bulwarks, and defended himself nobly, but having refused to ask for quarter, his antagonist was reluctantly compelled to cut him down.

The hatches were now secured upon the multitude below, the captives of the sixteen dare-devils above; and the closing of the hatches was accompanied by an information, that the slightest attempt to alarm the fort or to recapture the ship would be followed by an immediate discharge of grape-shot through the decks.

Here, then, was the Minerva, and her guards and crew, fairly in the hands of our heroes, but they had yet much to do before being absolutely secure of their prize. On looking around them, they discovered that not only were her topmasts struck, but that all her sails were unbent, and her foreyard lying across the forecastle—her deck being, at the same time, "lumbered up" with goods intended for disembarkation next morning. In this state it was impossible that the vessel could sail an inch, and there was no time to be lost, for an entire quarter of an hour had elapsed since they got on board, and at day-dawn the fort would at once discover what had happened—so the Indian was dispatched to the *cuddy*, where a number of the defeated seamen had taken refuge, to learn where the sails had been stowed—they were below, and the rolling of several guns from the ship's side to the middle of the deck, with a few intimations, "upon oath," that they were ready for the work of destruction, soon induced the Spaniards to hand the sails upon deck. These got, all hands were immediately at work. The topmasts were swayed away, as also the foreyard and topsail yards. In any other than the most desperate circumstances, they would have been altogether unequal to the fatigue which, exhausted as they were by previous labour and want, they sustained in putting the vessel in such trim as to enable her to sail out of the harbour. At length the sails were bent, but then there was hardly enough of wind to make them flap against the masts. It was, in fact, and had been during the whole night, a perfect calm. The situation of the captors became every moment more perilous. Should morning dawn upon them where they lay, they were lost; for what defence could they make against a combined attack from the fort and from all the boats of Arica? Already voices were heard on the shore, and they dreaded that an early visit to the ship would be the first duty of the custom-house officers. They were in an agony of hope, fear, and anxiety. Daniel in the den of lions was not more awkward or uncomfortably situated; and yet what could they do? Why, without wind they could do nothing. To escape now in their own drugger appeared utterly impossible, for the lighter sailing boats of the Aricans would soon overtake and capture her. At this most critical moment—not half an hour before day-break—a slight breeze *did* spring up, and in an instant their hearts were as much elated as the instant before they had been cast down. The cables were immediately cut, the sails set, and the Minerva stood out to sea. The breeze was light, however, and before she was beyond the range of the fort, the Aricans, to their utter astonishment, for they could not conjecture what had happened, as no other vessel was in sight, saw the Minerva bearing briskly down towards Moro-Blanco, a promontory on the south side of the bay, several miles distant from Arica. With the strong military force on board, they could not persuade themselves that there existed a possibility of her having been taken by an enemy. The most natural conclusion was, that the soldiers themselves had made a joint speculation of her. The alarm was immediately given in the fort, and throughout Arica; and in less than half an hour the harbour and beach were crowded with soldiers and sailors ready to embark in pursuit of the fugitive ship, in the hope, that, as the morning advanced, the breeze would die away.

The Minerva had just rounded the blunt point of Moro-Blanco, when, as the Aricans had anticipated, it became a dead calm, and she once more lay like a log upon the water. Here, then, were the captors again in a situation not much better than that from which they had so recently escaped. They were not to be daunted, however, by this fresh difficulty, but ordering the Spaniards on deck, by two at a time, they pinioned them, and shipped them on board the drugger, the ship's launch, and small boats, reserving only one of the smallest for their own use. This accomplished, they pointed the guns towards the boats, ordering the Spaniards on shore, a small number of rowers remaining unbound, and threatening to blow them out of the water on the slightest indication of a disposition to disobey orders. They now took a snatch of refreshment, which to their empty stomachs and exhausted frames was true balm, and then hurried to prepare for the attack, which, as a matter of course, was to be expected from Arica. They double-shotted the ship's guns with grape, and unloosing those on the starboard side, brought them over to the larboard, on which side, being that opposite Arica, the attack was naturally to be anticipated. They soon smashed out rude port-holes in the bulwarks, and pointed the cannon.

In the meantime, the crew of the Minerva, with the Spanish soldiers, reached Arica, where the particulars of the exploit were immediately made known. Not a moment was lost in manning the boats that could be collected. Their number was not great, it is true, but they were crowded with men, who, had they been all cannibals, would have made but a sorry breakfast of the sixteen half-starved hands on board the Minerva. Having learnt the precise number of the Minerva's captors, their exasperation at the audacity of the adventure was unbounded; but for so daring an insult, they promised themselves the satisfaction of making an immediate return of most ample vengeance. They were, in fact, so filled with resentment, and so anxious for revenge, that they neglected to be cautious. In the hurry and heat of the moment, they seemed only to strive which should first reach the Minerva by the shortest road. To men of cooler passion and calmer judgment, it would probably have occurred, that the safest, and in other respects the best mode of attack, would have been to disperse the boats, and, by surrounding the vessel, be in a situation to board on all points at once. Had this been done, the handful of Englishmen must inevitably have been cut to pieces. But the Spaniards did not condescend to consume time in concerting a plan of co-operation. They pulled on in a body, to devour, as they said, the devoted Englishmen. The Englishmen, however, were prepared for them. As the fleet of boats approached, they coolly took their aim with every gun on board. The boats advancing in a dense extended line, each gun was brought to bear upon particular parts of them, so that there should be no useless expenditure of powder and shot. The Minerva being a deep-waisted vessel, with a top-gallant forecastle and

* Rowing in a decked boat is, in a technical phrase, *sweeping*.

poop, the boats' crews did not discover the preparations that had been made for their reception—so they continued pulling on until they were within pistol shot of the ship's side. At that moment Mackay, to whom all eyes on board the Minerva were now directed, every thing having been in perfect readiness, gave the signal to "fire." A shower of millstones could not have been productive of more frightful effects. The moment before, the boats were in gallant array, burdened with some hundreds of bold hearts, inflamed with rage and revenge—the next, it was as if the besom of destruction had gone over them. To use a homely simile, the broadside of heavy grape made a commotion among the boats, similar to that which is produced by an unexpected shot from a well-loaded fowling-piece among a flock of ducks on the bosom of a pond. Instead of one such shot, however, five and twenty double shots of grape and canister were sent by deliberate aim among the boats of Arica, and each shot struck its allotted portion of the line of attack. At the scene which presented itself when the smoke cleared away, even the drugger's crew were appalled. The grape had swept the entire line, carrying death and destruction before it; and the cannon's roar was in an instant succeeded by the loud shrieks of the wounded and drowning. Several boats were sunk, others were fast sinking, while those that swam were soon overloaded by such as had scrambled into them, or had been picked out of the water; some of the craft, indeed, were in this way swamped, and their crews suffered to perish, for there existed no means of saving them. All around was covered with shattered planks, drifting oars, and the still buoyant bodies of the killed, while here and there were seen wounded soldiers, sailors, and citizens, engaged in an ineffectual struggle for life.

The surviving boats soon made for Arica, and the authorities there wisely resolved to make no farther attempt to disturb the new masters of the Minerva. One of these, the same Tom Martin whose name has been already mentioned, and from whom this narrative has been chiefly derived, was informed, some years afterwards, that the Minerva's fatal broadside consigned to eternity upwards of 150 men!

Not in the least surprising incident in the fortunes of Mackay and his shipmates remains to be related. After having deliberately put the ship in proper sailing trim, they stood out to sea, in order to catch the trade-wind, which, at the distance of 150 miles from the land, blew at that season from the north. Having reached this wind, they bore down for Valparaiso, with the view of disposing of the ship and cargo, and of dividing their spoil. Off Valparaiso lay a strong Spanish fleet, blockading the port; but of this circumstance our adventurers were not aware, neither did they entertain the slightest suspicion that an obstacle of so formidable a nature was at all likely to oppose itself to the completion of an adventure already so nearly crowned with success. At nightfall, previous to the morning when they expected to reach Valparaiso, they were not sufficiently near that city to distinguish the fleet that lay in the offing; so the wind being favourable, they skimmed over the waves with hearts bounding in the pride of being the undisputed masters of so gallant a ship and all she contained, little dreading the danger into which they were about to fall. On they went, however, and a dense fog coming on at day-dawn, they sailed through the very thickest of the Spanish fleet, not only without either seeing or being seen by a single ship, but without even suffering that annoyance which is produced by a consciousness of being in a situation of extreme danger; and, before the fog cleared away, they lay safely moored below the fort of Valparaiso—so true does it seem to be that "fortune favours the brave!"

On the morning, they received the congratulations of the governor of the city, by whom the Minerva was declared a lawful prize, and all Valparaiso resounded with the praises of her captors' heroism.

The vessel and her cargo turned out a prize of great value, and the English tars soon found themselves in the possession of what appeared to them inexhaustible riches. They would not have been true British seamen, however, had they hoarded up their wealth. No less characteristic of their profession was the reckless intrepidity which one and all of them had displayed, than was the profusion of their expenditure after getting fairly on shore. Each got his riding horse, and his sweetheart, of course. They gave balls, grand theatrical parties, and all sorts of sumptuous entertainment; and when they met, as they often did, it was quite a common thing with them to toss up for a score of dollars, or to play "evens or odds" for a handful or a pocketful at a time. In a few years afterwards, so effectual had been the exertions of some of them to get rid of their money, that they again found themselves before the mast in Lord Cochrane's fleet; while others, more provident, established themselves as respectable and substantial citizens. Mackay became one of the most considerable of the merchants and shipowners in Valparaiso, where, for aught that is known to the contrary, he still lives in the enjoyment of his wealth.*

* We have taken the liberty of extracting this most amusing and cleverly written article from a small volume lately published at Dundee, under the title of the ANGUS ALBUM, and of which we have nowhere seen any notice taken by the public press. The Angus Album, along with some inferior writing, as was to be expected, contains a considerable quantity of matter that reflects no little credit on the authors, and on the province from which the work proceeds. We particularly instance the poems of Mr A Laing, which are entirely in the style of the familiar songs of Scotland, and in touching simplicity of expression rival many of those revered compositions. Attempts of the kind to which this publication belongs, are always to us a subject of congratulation, for they show that intellect is stirring in remote parts of the land, as well as in what are called literary marts; and it is by training in such fields that the talent of the country is made fit for exerting itself in more conspicuous parts.

BENMUICHDHUI AND LOCHAUN.
